*THE LIVESTOCK* *Combined* *CALIFORNIA*  
*and DAIRY JOURNAL* *with* *CULTIVATOR*

An Illustrated Weekly Magazine, Devoted to the Rural Home and Ranch

LOS ANGELES

January 5, 1918

SAN FRANCISCO

## This one-armed man Pulls big trees by hand

**F**RANK M. HANCE, a one-armed farmer of Bowie, Md., sent me this photo of himself and a "K" pulling a double silver maple, 3 ft. 8 in. in diameter at the ground. What he has done you can do. Clear your stump land cheaply—no digging, no expense for teams or powder. Your own right arm on the lever of the "K" Stump Puller can rip out any stump that can be pulled with the best inch steel cable. I guarantee it. I refer you to U. S. Government officials. I give highest banking references.

### HAND POWER Stump Puller

**A**NY red-blooded man with a "K" can outpull 16 horses. Works by leverage—same principle as a jack. 100 lb. pull on the lever gives a 48 ton pull on the stump. Made of best steel—guaranteed against breakage. Has two speeds—60 ft. per minute for hauling in cable or for small stumps—slow speed for heavy pulls. Works equally well on hillsides or marshes where horses cannot go.

**IMPORTANT** To one man in each locality I will make a special money saving offer. Write for it today.

**FREE BOOKLET** Simply send your name and address for my free booklet on Land Clearing. It tells many things you should know.

**Walter J. Fitzpatrick**  
Box 397  
182 Fifth St.  
San Francisco,  
Calif.

Weight, without cable, 171 pounds

# Farm for Profit

## and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

## MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

Vol. L, No. 1

LOS ANGELES: January 5, 1918

One Dollar Yearly

## Make Returns for 1917 Income Tax Now

All Cash Transactions Between January 1 and December 31, 1917, Will be Basis for Payment.  
Get Blanks from Internal Revenue Officer at Once; Make Return Before March 1

INTEREST in the income tax is increasing. The return must be in the hands of the internal revenue collector on or before March 1. The short form, "1040A," of return is now ready. It is for those with income of less than \$3000. The longer form "1040" is for those with incomes of \$3000 or more. A report card request to "Internal Revenue Collector," either San Francisco or Los Angeles, will bring either.

Collector John P. Carter of Los Angeles is now instructing a corps of workers who are to visit various counties of the South, and we doubt not the San Francisco office is preparing for similar service of suggestions to those who wish help in making out reports.

Meantime the Cultivator is helping through the mails and through its columns:

### Loss of Live Stock

"If a person loses a number of cows because of disease, later buys cows, then possibly later sells some, must the money received from the sale be accounted for and how should the loss from dead cows be treated?"

That depends entirely on circumstances. Are you a breeder and were the cows breeding stock? If so then your permanent investment was affected and no deduction can be made. But if you are a feeder then you may have bought a bunch of cows or steers, all to be sold in a short time at advance, then your income is affected directly and the deduction is made. Ordinarily the loss of stock on a farm, or of a building by fire, while it may affect the income ultimately is not to be deducted. Keep a clear idea as to permanent investment or capital and what is cash (or product consumed) return for the 12 months.

### Money from Real Estate

"Is money received from sale of real estate to be accounted for in making return.

Your original capital is not affected, but increase or profit made on deal, less amount paid for taxes during past year or other necessary maintenance expense, is taxable.

### Money Loaned

"Where one has made a loan and it is repaid by the borrower, must it be counted as income?"

No. Interest which is paid on it is income, however, which is taxable.

\* \* \*

However, a most interesting statement to farmers is made by a member of the treasury department and from this we quote:

### FARMERS AND THE INCOME TAX

By Alson Secor of the Treasury Department

ANYONE heretofore you have not paid any attention to the income tax. It is time you did, because a failure to report your income before March 1, 1918, will cost you dearly—

for the penalty is from \$20 to \$1000 fine, and in addition 50 per cent of the tax due. If you fail to give truthful answers to the questions on the blank the fine will not exceed \$2000 or will not exceed one year's imprisonment, or both, in the discretion of the court. In case of sickness or absence from home you may get an extension of time by written application to the collector of internal revenue, in which must be stated the reasons why the return cannot be rendered in the time prescribed by law.

If you dodge the tax this year and next, or for years to come, look out for the day of reckoning when somebody reports you and the government collects all back taxes with the penalties of five per cent of the amount of tax due and one per cent interest for each full month which the tax remains unpaid. It is cheaper to pay every year and not try to dodge it.

### Who Must Report Incomes?

Every unmarried person having a net income of \$1000 or more, and every married person having a net income of \$2000 or more, in 1917, must report before March 1, 1918 to the collector of internal revenue for the district in which the taxpayer resides. It is necessary that you find out whether you have an income that will make you taxable under the new law. So you had better get out your pencil and do some figuring.

The law defines income as profit, gain, wages, salary, commissions, money or its equivalent from professions, vocations, business, commerce, trade, rents, sales or dealings in property, real or personal, and interest from investments, except interest from government bonds or any state, municipal, township or county bonds. Income from service as guardian, trustee or executor; from dividends, pensions, royalties, or patents, or oil and gas wells, coal lands, etc., and income from all sources are taxable under the law if the net income from all sources come to the sums named.

It is going to be some task for a farmer to find out what his income was. Few keep books, especially of the smaller items bought and sold. It is counted as sale if you take butter, eggs, apples, potatoes or any product you have raised to the store and "trade it out" for groceries, wearing apparel, or what not. Living expenses cannot be deducted, so you must figure the value of the farm products traded for something, as though you sold the products for cash. It is nothing to the tax collector whether you got cash or sugar for the product.

The same is true of real estate. If you sold part or all of the farm they figure as profit or income the difference between the cash value March 1, 1913, and the price for which sold, or the difference between its cost and selling price if acquired on or after March 1, 1913. Rents are considered income whether paid in cash or in part of the crop or otherwise.

### What Is Exempt?

Of course there are exemptions. The single person who is supporting dependent children or dependent parents or crippled relatives who cannot help support themselves is considered the head of a family and has the same exemption, \$2000, as a married person. Unmarried persons with incomes of less than \$1000 and no dependents are exempt from the tax.

Where husband and wife both have incomes they can report together and claim one exemption, or report separately and divide the one exemption between them. In case they are divorced or living apart, the one caring for the children can claim full exemption and the other only \$1000.

There is an exemption to the extent of \$200 for each dependent child under 18 years of age. Suppose your net income figured up to \$2800 and you have four dependent children under 18 years, you would be allowed \$800 deduction for them.

### Other Exemptions

There is a certain depreciation in the value of property which is exempt. It runs as follows: five per cent on frame buildings and two and a half per cent a year on brick or stone buildings; ten per cent on the cost of farm machinery and implements. But this deduction must be based upon actual depreciation through use or partial destruction. If its value is the same as the year previous there is no deduction.

In case of loss by fire, theft, or storms, not covered by insurance, you can deduct the fair market value of the property. This applies also to machinery, implements and farm buildings. You can deduct losses in trade or business provided the loss was actually suffered. But you can't deduct for hogs lost from cholera or cattle from sickness unless you had bought them, and then only in the amount you paid for them. Neither can you deduct for loss of any stock or grain or feed that you have produced because you are not required to report on these until sold.

You can deduct incomes from liberty bonds and certain other public bonds and gifts to religious or charitable or educational institutions to the extent of 15 per cent of your taxable income, provided no part of the gift goes to an individual stockholder in said institution for his benefit.

All salaries or compensation paid by the state or political subdivisions of the state are exempt. That is, if you are a county supervisor or something whereby you get a per diem or salary, this does not have to be counted in the income tax report.

### What Is Not Exempt?

Your living expenses are not to be deducted from the total. And you cannot deduct any charge for any personal service rendered in the business, or for any member of the family working at home. You can't allow for a salary to yourself. But you can de-

duct for cash paid hired help as a part of the running expenses of the farm. Even where sons or daughters work for the parents at a wage, the wage must be paid in cash as to strangers and then this expense may be deducted. If this is done to avoid the tax there is severe penalty.

"All necessary expense actually paid within the calendar year in carrying on the business" may be exempt from taxation. The question is: What is necessary expense? The family and personal expenses are not so considered. Your groceries, fuel, light, clothing, things like a piano for the home, are personal or family expense and not deductible.

But you can deduct taxes, except income taxes and those assessed against local benefits. Deduct interest paid on your indebtedness, insurance except on your dwelling; seed and feed purchased; stock bought for resale, cash paid for hired help, but cannot deduct as part of the wage the value of their board, lodging or washing.

You can deduct for the necessary repairs, but not for permanent improvements nor for new machinery. You can deduct for small tools and for the cost of running your machines, such as tractor, threshing machine, etc. However, you can not deduct for the cost of running the family auto if used as a pleasure car. If used only as a part of the farm machinery to run about on business its cost of operation can be deducted.

In brief this is the new income tax law. It is up to you to see the income tax man. Don't think the tax does not apply to you. Find out by talking with him and when you go to see him have all figures ready showing what you took in and what you paid out.

The government is going to send its income tax men out where it will be easy for you to get to them. An income tax man is going to be in every county in every state in the Union sometime between January 2 and March 1. Watch the local newspapers or ask your banker or postmaster when he'll be there, or near your place, and then go to see him. He will have tax form for you, help you make it out, answer all your questions, and won't charge anything for his services.

Don't neglect the income tax because if you do you'll regret it later when the government finds you out, as it will, and makes you pay the penalty for failure to obey the law.

### Penalties

For failing to file income report before March 1, 1918, not less than \$20, nor more than \$1000, and in addition 50 per cent of the amount of the tax due.

For failing to pay tax before June 15, 1918, five per cent of the amount of tax due, and one per cent interest for each month tax remains unpaid.

For making false report, not exceeding \$2000, or not exceeding one year in jail, or both.

## These tools enable you to cultivate triple the acreage

They are so scientifically constructed that you can do 3 to 6 times as much as with old-fashioned tools in the same time, and get bigger and better crops because of more thorough cultivation. 45 years of practical farming and manufacturing experience is back of every Planet Jr. Fully guaranteed.

**No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel-Hoe, Cultivator and Plow** sows all garden seeds (in drills or hills), plows, opens furrows and covers them, hoes and cultivates all through the season. A hand machine that does the work so easily, quickly and thoroughly that it pays for itself in a single season.

**No. 12 Planet Jr Double and Single Wheel-Hoe** is the greatest combination hand-cultivating tool in the world. The plows open furrows, cover them, and hill growing crops. The hoes are wonderful weed-killers. The cultivator teeth work deep or shallow. Crops are straddled till 20 inches high; then the tool works between rows with one or two wheels. 24 styles—various prices.

**S. L. Allen & Co.** Box 1106P  
72-page Catalog, free! Philadelphia

Illustrates Planet Jrs doing actual farm and garden work, and describes over 55 different tools, including Seeders, Wheel-Hoes, Horse-Hoes, Harrows, Orchard, Beet, and Pivot-Wheel Riding Cultivators. Write postal for it today!

We carry stock in Los Angeles. Agencies in all principal Pacific Coast cities.

## DITCHES

Make the New and Clean the Old—irrigation or drain, grade roads, build dykes—in any kind of soil, sand, rocks or gumbo, wet or dry, on side hill or level ground with

**THE Martin Ditcher & Grader**

Reversible, Adjustable, No Wheels or Cogs

**SOLD ON 10 DAYS TRIAL**

All steel. Made in 2, 4 and 6 horse and tractor sizes. Economical from first cost on. Over fifteen thousand satisfied customers. No farm or ranch outfit complete without a "MARTIN." Use one a day and you'll agree.

**Write** for catalog and list of users near you. No charge, no obligation; postal will do.

**OWENSBORO DITCHER & GRADER CO., Inc.**  
Desk 1 Denver, Colorado

## Tree Protectors for Winter Use

**PREVENT Moderate Freezing**  
Sunburn, rabbits, squirrels, barking by sand storms and cultivation.  
Easy to put on and cheaper than gunny sacks.

### COLLAPSIBLE PLANTING POTS

Why not raise your early Tomatoes, cabbage, chili and egg plants for home use or for market. Do you know that you can start

Cucumbers, cantaloupes, melons of all kinds in these pots in flats until they have three and four leaves then plant pot and all, have melons two or three weeks earlier for market. Just the thing for DATE propagating. Write for samples and prices of both Pots and Protectors. State which you are interested in.

Branch: 1228 "H" St., Fresno

## Lime—Its Value and Use

By Gilbert Ellis Bailey

**S**OME people still think that all rocks are something made somehow in the early days of the world during a great turmoil of fire, heat and vapors. The fact is that rocks are being quietly formed now, as they have been in the past, by agencies that scarcely attract attention.

One of the most common, most extensive, and most valuable rocks known has been and is still being quietly formed, and mainly by plants of simple structure.

### Limestone

The limestone formations of the mountains, the corals of the seas and the marls of the ponds are all mainly from the secretions of vegetable life, each particle at one time resting in the cell of a plant. Animal life has supplemented this work, but vegetable action has been the dominant one.

Nature in the past has simply been storing it up for our use in the present. The fact is that the agricultural world is just beginning to wake up to its importance to plant growth. A glance at its origin emphasizes and explains its value to the farmer.

All organic matter is made up primarily of carbon (C), hydrogen (H) and oxygen (O). Land plants derive their C, H and O from the air and soil atmosphere; but aquatic plants must secure theirs from the water.

All know that nearly all waters, especially "hard waters" and ocean water contain lime in solution. All know that lime largely forms the bones of animals, sea and fresh water shells, and the hard parts of hens' eggs, worms, some sponges, and most corals.

The lime secreting algae which grow so rapidly at various depths and temperatures in both sea and fresh water are the great limestone builders. Through all geologic history they have been at work taking the lime from the ocean and land waters which now form the strata of the mountains, the deposits of the valleys, and the lime in soil and subsoil.

The algae are seaweeds and water-dwelling plants which have existed from the earliest geologic records (pre-Cambrian) to the present time. One lime secreting alga (Halimeda) of the present oceans contains over 90 per cent of lime and forms extensive deposits of limestone in the lagoons in coral regions. The "coral insect" (Anthozoa) and the "sea lilies" (Crinoidea) of the past belong to the border line of plant and animal life; and the coral reefs of the past form many a lime-kiln quarry of today. The rock weed (Fucus) exposed at low tide; the large alga or "devils-acorn" (Laminaria), and the huge masses of the Sargasso sea are now busy secreting lime for strata and soils yet to be used as the world grows old. The common stonewort (Chara) of the fresh water lakes secretes so much lime that it encrusts its leaves and stems, making them white and brittle, and on their death this settles into the mud, making marl. Even the common green alga floating on the ponds, forming frothy masses called "pond scum," contributes its quota of lime. Myriads of microscopic forms of vegetable life are sending an unceasing shower of lime particles into the sediments underlying water that in the future will become soils.

### Lime Defined

There is much confusion with ref-

erence to the actual nature of lime and its use in agriculture. The term is applied indiscriminately to many combinations of lime. Strictly speaking the use of the term should be restricted to calcium oxide. All lime minerals contain this, and it is the particular portion of the mineral or compound that is of interest to the farmer.

Pure limestone is carbonate of lime or calcium oxide plus carbon dioxide. When pure limestone is well burned it loses 44 per cent of its weight, by driving off the carbon dioxide. Therefore 56 pounds of fresh burnt lime is equal to 100 pounds of pure limestone. This fresh burnt lime will absorb water and form 76 pounds of slacked lime, or hydrated lime. For farm purposes therefore 1200 pounds of fresh burned lime, or 1500 pounds of hydrated lime, or 2000 pounds of ground limestone, all contain the same amount of actual lime and have the same final result on soils and crops.

### Acid Soils

The beneficial effects of lime in agriculture are many, the most common being the neutralizing of soils made acid by decaying organic matter. The "sour," or acid, soils check plant growth, stop beneficial bacterial action, stimulate action of harmful bacteria, and cause direct loss of nitrogen. Sour soils cause "sour sap," which causes the death of thousands of peach, almond and other trees, and does damage in other ways. Lime in the soil is the remedy.

### Humus

The popular saying that "a limestone country is a rich country" is so true that one does not have to be a botanist to see the change in vegetation as well as in prosperity as one enters a limestone agricultural district, as in Kentucky. Humus is the very life of the soil and lime is essential to the existence of normal humus. Without humus fertility is almost impossible and much plant growth is at a standstill.

What is wanted is the quick conversion of vegetable matter into black neutral humus, but it will be acid and not neutral if lime is not present. Production of the dark tinted appearance of true calcareous lands requires only about 0.2 per cent of humus in sandy soils, while the percentage must rise to nearly 1.0 per cent for clay soils.

### Bacteria

Lime is the key to the great storehouse of nitrogen in the air.

The bacteria can take nitrogen from the air but cannot keep it unless they have something to fix or bind it to. This something is lime. The bacteria form nitrate of lime, which is soluble in water and is thus able to enter the sap of the plant.

The plant in turn uses the nitrogen in forming its leaves, its fruits and its flowers, leaving the lime stored in its cells. Thus in a test plot it was found that wheat and barley each removed from one acre of land nine pounds of lime; oats 11 pounds; turnips 74 pounds; clover 90 pounds, and legumes in general much more than this.

Legumes must have not only ample supplies of lime, but large supplies of nitrogen also, and must be inoculated with the nitrogen bacteria, and the soil must be limed. As the lime contents become scarce, bacterial

activity decreases, seriously interfering with the normal decay of the humus and resulting in a marked lowering of the crop production.

#### Potash and Phosphorus

Lime is needed in the soil for the chemical changes that liberate potash and phosphorus. Potash is held so securely in the soil particles, combined with silica (quartz), that it is unavailable and useless as plant food until lime combines with the silica and sets the potash free. The phosphorus in the soil is often combined with iron and alumina and is useless until lime changes it into phosphate of lime which is soluble and in form for the plants to use.

When lime is absent from the soil even high percentages of potash and phosphorus prove insufficient for good crop production. When a large per cent of limestone is present in the soil lower percentages than normal of potash and phosphorus are adequate for crop production.

#### Fruits

Fruits grown on limestone soils show a stocky, steady, vigorous growth and the fruit ripens well. With stone fruits the lime strengthens the stem and woody portion of the tree, shortens the period of growth and hastens the time of ripening. Grapes, citrus and other fruits flourish best in lands moderately calcareous; and many claim that an adequate—not excessive—supply of lime in the soil will produce sweeter fruit than when the lime supply is deficient.

#### Physical Effect

Lime makes loose sandy soils more compact and retentive of moisture. A small amount of lime will cause flocculation of clay, holding the soil crumbs together as the moisture dries out. It thus improves the texture of clays, destroying their adhesiveness and making them more open and mellow, of good tilth, easier to work, and favoring the penetration of air and water.

#### Loss by Leaching

It is well known that lime is the ingredient that is leached out of all soils by drain waters. When water evaporates as in the tea kettle, or boiler, the lime is left as a crust. The weakest of acids, such as the juices of fruits, decomposes limestone, setting the gas free and allowing the lime to be used by the bacteria, provided it is not lost by leaching.

In a residual limestone soil only three feet deep it was found that over 80 per cent of the original lime had disappeared through leaching. These facts should make it clear to every farmer that the supply of lime should be renewed every few years.

#### Mining on the Farm

When a farmer wants more lime he has several sources of supply. He can find a supply often in the subsoil by shattering it with explosives so that the plant roots can go down and help themselves. By the use of explosives he can readily develop lime in the substratum even to depths of 10 and 15 feet. Sometimes hardpans are formed by the lime that has leached down, forming a cemented layer whose existence he has mourned over. Explosives change this nuisance into a blessing, for with explosives he can shatter the hardpan and own a nice lime quarry right where the plants can use it without any further effort on his part.

#### Plant Miners

There are special forms of plant life that will do the mining for the farmer and pay for the privilege.

These are the legumes, the peas, beans, soy beans, clover, vetch, alfalfa, sainfoin, fenugreek, etc. They cannot prosper without lime and will send their roots deep down into the soil shattered by explosives in search for this mineral.

After these legumes have been used for cover crops, green manure, forage, or silage, the nitrogen, lime, and humus in the stubble are buried in the

soil ready to feed crops, from corn to cotton, from potatoes to oranges, with the indispensable lime.

#### How to Use

Air slacked lime is the quickest, but fine ground limestone is safer, as it may be applied in almost any quantity at any time and cannot injure anything. Put on after plowing, never before, and harrow in some time before legume or other crop is planted.

## Nicotine Sulphate for the Garden

By F. H. Chittenden, United States Bureau of Entomology

**F** METHODS of control for soft-bodied sucking insects such as aphides or plant-lice, nicotine sulphate has given the best results. Tobacco has also been used in recent years to a considerable extent for greenhouse fumigation, but most other compounds have been superseded by nicotine sulphate and nicotine fumigating papers.

A solution of nicotine sulphate, standardized to contain 40 per cent by weight of nicotine, abbreviated to "nicotine sulphate 40 per cent," has given the best results. It has been tested practically wherever melons and other cucurbits are grown on a large scale, and especially in California, Illinois, Florida, Oklahoma, Texas, and in several other states, both by experts of the bureau of entomology and other practical workers. It was used on one occasion at Turlock, on 800 acres of watermelons and cantaloupes, with excellent results.

While we recommend nicotine sulphate 40 per cent for the melon aphid, no claim is made that it is a magic remedy, since careful application is required as in the case of all other insecticides.

Nicotine sulphate is used according to what is known as the 1-1000 formula, or one part of nicotine sulphate to 1000 parts of water. To this mixture should be added sufficient soap or similar spray material to act as an adhesive or "sticker" and as a "spread-er." Common laundry soap is cheap, easily obtained and satisfactory for the purpose. The amount required

may be estimated on the basis of one pound to each 25 gallons of the mixture.

For purposes of quick estimation, the following formula will be found to combine the ingredients in the proper proportions:

Nicotine sulphate 40 per cent, three ounces, fluid;

Yellow laundry soap, one pound, avoirdupois;

Water, 25 gallons.

The spray is most effectively applied by a power sprayer since a much more even distribution is effected. Such a sprayer may be equipped with four lines of hose, each fitted with one or more wide-angle nozzles provided with elbows and operated by one man to each row. For hill spraying a hand-sprayer, costing about \$1.25, is generally used.

It should be added that nicotine sulphate is designed especially for insects which derive their food by sucking. Arsenicals like arsenate of lead and Paris green are used for insects which derive their food by chewing or biting.

#### GETTING EVEN

Why do you insist on trying to sell me beefsteak and beans and buckwheat cakes?" demanded the barber. "I told you all I wanted was two fried eggs."

"Well, I was in your shop yesterday," retorted the restaurant man. "All I wanted was a shave, but you bulldozed me into a shampoo, a foam fizz, and a tonic rub." — Louisville Courier-Journal.

#### APPLE PRODUCTION IN THE NORTHWEST

The principal apple producing sections of the Northwest are approximately: Walla Walla, Washington, 500 cars; White Salmon and Underwood, Washington, 200 cars; southern Idaho, 2200 cars; Yakima Valley, Washington, 8500 cars; Lewiston, Idaho, 250 cars; Bitter Root, Montana, 500 cars; Hood River, Oregon, 1200 cars; Medford, Oregon, and adjoining districts, 1500 cars; Wenatchee, Washington, 8000 cars; Spokane, Washington, 650 cars.

#### NOT ANY MORE

They were gazing out of the window of the Pullman car. The thin man was rapturously admiring the sunset.

"Ah, Nature is a real artist," exclaimed the thin man, addressing the fat man who sat in the opposite seat. "Have you never gazed at her wonders? Have you never watched the lambent flame of dawn life leaping across the dome of the world? Have you never watched the red-stained islets floating in lakes of fire? Have you never been drawn by the ragged, raven's-wing, sky-fantoms as they blotted out the pale moon? Have you never felt the amazement of these things?"

"Not since I swore off," replied the fat man, as he prepared to hunt another seat.—Cincinnati Enquirer.

#### INCUBATION

"Mr. Christy," said the teacher of the class in rhetoric, "point out the absurdity in this figure of speech: 'At this time the illustrious statesman hatched out a scheme'."

"It seems all right to me," said the young man, after a few moments' reflection.

"It does? Explain, if you please, how he could have 'hatched out a scheme'."

"Well, he might have his mind set on it," returned the student placidly.

I find the gayest castles in the air that were ever piled far better for comfort and use than the dungeons in the air that are daily dug and cavered out by grumbling, discontented people.—Emerson.

## PLANT TREES

Do your "bit" toward insuring a supply of food for the world's millions.

The best varieties of trees are selling out fast.

Shipping Plums, Prunes, Cherries, Pears, Olives, Almonds, Apricots, Peaches—all are equally profitable according to your location. No other investment their equal.

Our foothill trees are free from the root diseases common to other localities. Pedigreed parentage—roots fibrous and well branched—trees hardy and of toughened fibre—features that spell success in tree planting, and in your orcharding.

Submit me a list of your wants for special quotations. Do this now while our assortment is complete. Mail your list right now to Dept. J

Remember! We will take your Liberty Bonds in full or partial payment for trees.

*J. E. Bergtholdt*  
Sec. & Mgr.

**SILVA-BERGTHOLDT CO.**  
NEWCASTLE-CALIFORNIA

Foot-hill grown trees are immune to crown-gall and root-knot

Roots such as are grown only on our foothill soil and location. THEY ARE TREE INSURANCE

# Armstrong Nurseries

ESTABLISHED 1889

ONTARIO, CAL. 1918 Catalogue Ready

Brim full of valuable information—printed in easy-reading type; profusely illustrated. The book you will want to read before buying whether for commercial or home garden planting. Fully describes Tropical and Citrus Fruits—Avocados, Loquats, Guavas, Sapotas, etc.—Olives, Deciduous Fruit Trees, small Fruits, Nut Bearing Trees, Roses, Deciduous and Ornamental Shade Trees and Shrubs, Evergreen Trees and Shrubs, Palms and Plants.

Miller's Late Peach

## OLIVES

In all of the olive sections of the State, Armstrong Olive Trees are known as thrifty, vigorous trees, with an abundance of fibrous roots—so essential, particularly in an olive tree, for the development of a uniform grove. In planting such trees you take no chance of finding it necessary to replant from 25 to 60 per cent of your trees.

"Your olive trees, planted here last year, have made a splendid growth, and have given perfect satisfaction." — A. W. Munn, Sacramento Co., Calif.

## PEACHES

Bring your land into the profit class quickly by planting Tuscan or Phillips Cling Canning Peaches. Easy to plant—grow rapidly—bear early—big demand at canneries. Also we have the best of the extra early, medium, and late varieties for shipping, canning and drying. Inter-crop with some good crop for which your land is suitable. By so doing your orchard will more than double the value of your land in four or five years at practically no cost.

Ascolano

## WALNUTS

When you plant a Walnut tree, plant a GOOD, DEPENDABLE TREE. Armstrong Walnut trees are grafted on the native California Walnut by men who know how to make the grafts—how to take care of the tree—how to harden the wood—how to dig the tree and preserve all the root necessary to insure a strong, vigorous growth. This is INSURANCE to the planter. Our Nurseries are free from Walnut blight. Varieties—Placentia, Eureka, Neff, Mayette, Franquette.

Eureka Walnut

## ALMONDS

The California nut crop that brings money into the pocket of every owner of a well-located orchard. Demand growing larger—California produces all of the Almonds grown in the U. S. If you have a favorable location, you cannot do better than plant Almonds. Write us for any information wanted concerning varieties, situation, prices, etc.

Nonparel Almond

## Orange Drop

Written for California Cultivator

SOMETIME ago, in conversation with Dr. J. Eliot Coit, he referred to investigations which he and his assistants were making in regard to a fungus which he believed to be the cause, in part at least, of the ordinary June drop. These investigations have now been carried near enough to conclusion to justify publication of a bulletin which, as noted in Dr. Coit's letter following, will be issued sometime during the present month. Dr. Coit's letter was brought out because of requests for information by Horticultural Commissioner Collins of Tulare County. Dr. Coit writes:

"While it will be several years, no doubt, before this investigation is completed in all its phases, still we feel that inasmuch as the causes of the trouble and the nature of the phenomena appear to have been uncovered, a progress report is warranted. A bulletin giving a brief digest of the situation is now in press.

"You may be interested to know that a second year's work has brought out the fact that the fungus, *Alternaria citri*, as previously reported is not the only cause of drop. It has been found that much of the early dropping is caused by water deficits in the fruits caused by the climatic conditions. There is a good deal of overlapping of those two causes. Many of the fruits which fall early from climatic conditions are infected with the fungus and would have fallen later from that cause.

"Investigations of the distribution and nature of the fungus have shown that honey bees do not appreciably increase the amount of infection. It is also shown that the mode of infection is a serious hindrance to successful intervention by means of fungicidal sprays. We are led to conclude therefore that spraying with fungicides alone can hardly accomplish enough good to pay for the materials and labor. We believe that while June drop cannot be eliminated entirely on account of the impracticability of controlling the weather; still it may be quite possible to so modify environmental conditions as to secure a marked increase in crop and greater profits. Suggestions as to how this may be accomplished are made in the bulletin referred to above which we hope may be ready for distribution some time in January."

In addition we have read interesting notes made by Dr. Ford A. Carpenter of the Los Angeles station of the United States weather bureau. Dr. Carpenter made extensive investigations following the hot wave of last June which removed probably 75 per cent of the usual Navel crop from the trees. Dr. Carpenter goes at some length into the contributing causes of hot waves, in which he says:

"In the late spring, summer, and early fall when highs cover the North Pacific states and plateau region, light to moderate north to east winds prevail over California, and the cool ocean influences are checked or held back. The sky is clear and insolation is great, and the air is heated dynamically in moving down the mountain slopes, causing very high temperatures in the valleys and Coast sections. When these conditions are very marked they produce hot waves."

Summarizing his investigations in a short paragraph he adds:

"Summarizing the effect of the hot wave on farm products it is generally conceded that the most serious loss will be the Navel orange crop, which in some sections is almost a complete loss. Other varieties of oranges were not seriously damaged. Lemons were injured in instances where a considerable amount of mature fruit was on the trees. Much of such fruit was burned while hanging on the trees. Fortunately the greater part of the lemon crop had been picked prior to the period of great heat, so the damage loss is confined to autumn lemons. In this connection it may be remarked that lemon trees are continually in blossom, bud, and fruit. The citrus trees, as such, were not injured. Walnuts had a splendid setting prior to the heat wave, and, while the loss has been considerable, it is believed that the net gains this season will exceed those of last year. Garden truck withstood the heat very well; only early tomatoes were seared; in one district a crop of tomatoes valued at \$50,000 became a total loss. Had the heat wave been preceded by several weeks of normally warm weather, vegetation would have accustomed itself to the steadily increasing temperature, but the suddenness of the mounting temperatures and the steadiness of the driving winds followed too closely upon months of cool, moist weather."

## Spraying the Citrus

Written for California Cultivator

FLORIDA has had vastly more experience in the spraying of citrus trees than California; this largely because fungus troubles find more congenial conditions there than in California. In an address made recently by Prof. Stevens of the University of Florida at a citrus seminar he referred to some of these fungous troubles such as fruit rot, anthracnose, citrus scab, melanose and other serious troubles. We gave in a former issue a portion of his address which touched upon wither-tip.

These other troubles are handled mostly with Bordeaux spray. Fruit rot, for example, which is of course more serious during the humid weather, is caused by the blue mold securing entrance to the fruit through bruises or otherwise.

Another cause of trouble is insect

pests, that is, through weakening of the tissues of the fruits by insect attacks the mold secures entrance, so that spraying must take into account the eradication of the insects as well as directly the mold.

For anthracnose he recommends spraying with a good fungicide, preferably Bordeaux, at intervals of ten days until the disease is checked.

For citrus scab, 3-3-5-Bordeaux formula is considered sufficient. Spray freely in the earlier growing stages. On young trees or in groves where only a small amount of the disease is present, the infected foliage may be pruned off to advantage. It should be destroyed. All worthless sour, or rough lemon trees in the vicinity of grapefruit groves should be destroyed, or freed from the disease, as they form continual sources for spreading the scab. Badly infected fruits should

we'll gladly send it -

### ARMSTRONG NURSERIES

404 N. Euclid Ave., Ontario, Calif.  
Please send me a copy of your 1918 catalogue. I am planning to plant:

Pears ☐ Apples ☐ Cherries ☐  
Walnuts ☐ Almonds ☐ Ornamentals ☐

What else? .....How much? .....

Name .....

City .....State .....

R. F. D. or St .....

be destroyed and not allowed to rot in the groves or near the packing houses, as they are also sources for spreading the disease.

For melanose: Keep all dead wood out of tree for that is cause of infestation, and spray with Bordeaux.

Prof. Stevens gives the following suggestions as to control:

"Fruit and foliage diseases, as a rule, may be controlled or held in check by spraying. From one to several applications of some standard fungicide may be necessary. A fungicide serves merely as a protective covering for the leaf or fruit and must be applied at frequent intervals, and before the fungus has entered the tissue, to be effective. Applying a fungicide after the disease has become visible will not remove the injuries that have developed and in many cases sprayings made at this time are merely a waste of time. However, there are cases even when the disease is visible, when spraying may be used to advantage to check its further spread.

"The effectiveness of any system of spraying for disease control will depend upon several important conditions which may be listed about as follows:

"A reliable fungicide must be used and in sufficient strength to kill the fungus spores.

"The fungicide must be properly prepared, following strictly the directions given for its preparation.

"Spraying should be done before the disease becomes visible. Since the fungicide is to serve as a protective covering it must precede the spores.

"The spray should be applied under high pressure (180 to 200 pounds), and in the form of a fine mist. The object should be to obtain a thin covering over the surfaces exposed.

"Fungicides must be applied frequently as the efficiency of a single application may not extend beyond a period of ten or 14 days.

"There are certain limitations to the use of fungicides in the citrus grove, and at present we can hardly recommend spraying with them as a general practice. For the control of certain diseases they are necessary and must be used, but they should be used with caution at all times. This is particularly true in regard to Bordeaux mixture and the ammoniacal solution of copper carbonate. Just to what extent the lime sulphur solutions may be used as fungicides on the citrus tree is still a matter of experiment."

**MOVED**

The Cultivator has referred to the removal of the pathological laboratory formerly located at Whittier to the citrus experiment station at Riverside, but we have a note from the clerk of the Riverside station saying that owing to their long time connection with the pathological laboratory at Whittier, Professor H. S. Fawcett, C. O. Smith and E. E. Thomas are often written to at Whittier. Inquiries should be mailed direct to Riverside, care Citrus Experiment Station.

The University of California and the Fresno farm bureau united in the second annual fig institute which is being held in the high school of Fresno this week. This is one of the most important meetings having to do with fruit growing in this state. It has to do exclusively with figs, but Fresno is the center of this great industry which every year is growing in importance. It is well that it should, for this country is importing millions of dollars worth from Asia annually.

**A Good Crop**

Spot and Report the Trees Which Grow It

HERE and there, even in the warmer valleys where nearly all Navels dropped from the trees after the "June hot spell," are individual trees which still carry large crops. Mr. Shamel terms these trees resistants. Regarding them and the desirability of locating them he says:

Some of the leading citrus growers feel sure that there exists today in some California Navel orange orchard, —where the extreme heat and low humidity of June caused most of the crop to drop,—individual trees, that, by reason of their inherent resistance to extreme heat and low humidity are bearing normal crops of oranges! Further, it is the belief of these men that if these trees are found and buds from them propagated, the progenies of some of these trees will retain the resistant qualities of their parents.

Such progenies would constitute the beginning of a valuable improved, resistant Navel orange strain.

Never before in the history of the California Navel orange industry has there been so good an opportunity for finding productive resistant Navel orange trees, and every Navel orange grower should study his orchard and find out whether or not he has any such trees in his possession. From now until picking time is our opportunity for discovering such valuable trees.

In orchards where the heat and low humidity, or other extreme climatic conditions caused the most damage, it seems that the chances are best for finding hardy and naturally resistant trees. If any trees with good crops are found in such orchards, these trees should be marked so that they can unmistakably be relocated. When

picked, a record of their crop should be made.

It is possible that the crops on the fruitful trees, in otherwise barren orchards this season, may be due to other factors than inherent resistance to extreme climatic conditions. When found, the conditions around the trees must be studied from this viewpoint. If, after careful consideration of all known conditions it is concluded that the productive trees are bearing crops on account of their natural resistance to the extreme climatic conditions of the past winter, spring, and summer, such trees should be watched, their crops measured, and experimental propagations made from them by the use of carefully selected buds.

Every one who owns, or has access to a Navel orange orchard should, as a matter of public welfare, make every possible attempt to find hardy bearing trees this fall and winter. Many authorities agree that there is every likelihood that such trees exist in our orchards this fall. It should be our business to find them.

**Selecting' Nursery Stock**

Never forget one point in buying trees, viz.: that when purchasing "Roeding True Trees" nursery stock, you are buying from a firm that has devoted nearly a third of a century to the practical study of growing the very best trees that money, study and an inherent love for perfection in a tree can develop.

Remember also that buying trees is different from the average merchandising. It is not today or the morrow that tells the story, but it is three or more years of hard work, in cultivating, irrigating, pruning, etc., before your hopes are realized.

From the planting of the seed to the time our trees reach patrons, every care that human ingenuity can devise is carefully observed.

**CHERRIES**

We have this year a fine stock of all the leading varieties of cherry trees—they are vigorous and well rooted.

**PEACHES**

Growers throughout the state received handsome returns from their peaches this year.

**NECTARINES**

This delicious fruit is becoming more and more popular, and a larger acreage should be planted.

**APPLES**

Our list includes all the desirable varieties for home and commercial planting on the Pacific Coast.

**OLIVES**

The acreage planted to Olives does not begin to keep pace with the demand for olive oil and ripe olives.

**WALNUTS**

Walnuts are considered by many experienced planters as the most satisfactory crop to raise—the demand is strong and good prices usually prevail.

**PECANS**

The improved papershell type of Pecans should be planted for commercial purposes—our catalog deals at length on the subject.

**ALMONDS**

Twenty-five years ago California produced 150 tons. The average Almond output now is 3000 tons. The demand for this nut more than keeps pace with the increased acreage.

**Plant  
An Orchard**

If you have land suitable for tree culture, you can make it intensely profitable by planting fruit trees. We are always pleased to hear from prospective fruit growers and to render them every assistance possible in the selection of trees best adapted to their locality.

# Get this valuable free book

Do you own an orchard? Or are you going to plant one?

If so, you will find information worth many dollars to you in the **Giant TREE BOOK**, "Better Orchard Tillage."

This book is written especially for Pacific Coast fruit growers. It tells how to have thriftier, faster-growing, earlier-bearing trees by planting in beds blasted with

## GIANT FARM POWDERS

STUMPING — AGRICULTURAL

It tells also how to secure better drainage and increased moisture-storage capacity in established orchards, and how to get larger yields and save money on fertilizers.

The book contains illustrations that show exactly how to do the work. There are chapters on preparing the beds for trees and increasing the plant food by deep tillage. Also there are directions for blasting in established orchards or groves, and interesting letters from many prominent fruit growers.

## January in the Vegetable Garden

### Southern California

Written for California Cultivator By D. F. Reichard

ANY of us have been waiting for the rains to soak the ground so that it can be worked into shape for early planting. If the rains do not come shortly irrigation will have to be resorted to. It does the soil lots of good to have it turned up to the weather for a month or so, especially after it has been intensely cropped for some time. Work into the soil as much rough fertilizer as possible, such as stable manure, leaves and green crops; these all add humus to the soil as well as chemical properties which go to make plant foods for future crops.

During January hot beds or cold frames should be made to start tender plants like egg plant, tomato, pepper and sweet potato settings. A hot bed is made by digging a pit at least six by ten feet, 12 to 18 inches deep. Put in the bottom a layer eight to ten inches deep of manure that has been piled up and allow to heat for a couple of weeks. Turn it over, mixing well, and pack into the pit to the desired depth. This treatment of the manure reduces the intense heat that would otherwise burn the young plants as they come up in the bed, leaving it in a condition in which it will generate heat for about four weeks, by which time the young plants will be strong enough to continue their growth either where they are or transplanted to a cold frame. On top of the manure put a layer of well pulverized rich soil four to six inches thick. At the north side of the bed put two 12 inch boards on

edge, burying the lower one about half its width; on the south side use only one board buried a half; this gives the proper slant to admit sun and shed rain. Board up the ends, cover the whole bed with either glass frames or light muslin cloth which are removed during the heat of the day, always being replaced an hour before sundown. Settle the whole bed by wetting thoroughly, but do not put on so much water that it will drown the heat of the manure. In a day or two work up the surface and plant the seeds.

A cold frame is made by simply building the frame facing the south as in a hot bed. It has no artificial heat. By putting down the covering early in the afternoon there is enough heat retained to keep warmth over night. Do not take up room in the hot bed or cold frame for anything but tender stuff as the climate of Southern California will permit the growing of all hardy and semi-hardy plants from now on.

Plant in the open ground for succession the following; Egyptian beets, Half long carrots, Swiss chard, New York Special Lettuce, onions in variety, radish, spinach and turnips. In protected sections early potatoes, peas and Canadian and Ventura beans may be planted. Plant seed of cabbage, cauliflower and kale for transplanting later.

Made beds ready for asparagus, rhubarb and horseradish roots; they should be set out this month. Small fruits and deciduous trees should be planted within the next month or two.

## Northern California

Written for California Cultivator By A. R. Gould

UP TO the time of writing we are still without our real share of the usual first rains. True, we had a few drops some two weeks ago but this was only in some scattered sections and important districts such as the San Joaquin and Santa Clara Valleys are dry. As a result of these conditions our planting operations have naturally been very much delayed, and many of our most important crops will be late, as moisture is very necessary to assist germination. However where it is practicable to use the sprinkler, as in a small home garden, or irrigate, we can get ahead, and we must await our opportunity to plant on a larger scale as the rains arrive. We must take every advantage of the present conditions and get the ground in good shape and all rubbish cleared off ready for planting our crops for the next season. Raspberry canes should be attended to. There will be a few old canes to cut out and new ones tied in and the tops cut off, leaving the canes about four feet long. Farmyard manure should be dug in around between the rows, or a good fertilizer such as bone meal may be applied.

### Strawberries

The established plot should have a good dressing of manure, farmyard or artificial, dug in between the rows. Young runners, or plants, may now be severed from the parent plant and new plots formed.

### Carrots

Make a sowing of Early Shorthorn and French Forcing, two very suitable

varieties. Sow seed thinly.

### Cabbage

Seed should now be sown of such early varieties as Early Jersey Wakefield and Early Spring on a prepared seed bed.

### Artichoke (Globe)

Plants of this very popular vegetable may be put out this month. The old clumps may be divided and the younger plants thus secured. They should be planted three feet apart in the row, while the rows should be four feet apart. Plant in fairly rich soil and keep well watered, especially after they are well established.

### Rhubarb

Roots of these may now be planted three to four inches deep and three feet apart. The soil should have been deeply dug and richly manured. The best varieties are Crimson Giant Winter and Victoria.

### Spinach

This is a hardy vegetable and should be more widely grown. Seed of the variety known as Prickly may now be sown, also Victoria, a hardy long standing variety. One ounce of seed will sow a 100 foot row. A good rich soil is needed to get the best results.

### Kale

Another hardy plant and valuable for use in the kitchen or poultry yard should be sown in quantity. Sow the Dwarf Curled Scotch and Tall Green Curled.

### Broccoli

Sow seeds of Early Large White on

## DEEP WELL TURBINES

No valves to pack or plunger rods to get out of order. For use in any well ten inches in diameter or over.

A complete line of irrigating pumps of all descriptions, horizontal and vertical for belt drive or direct connection to electric motor.

Prices as low as are consistent with good quality and workmanship.

a well prepared seed bed. Seed should be sown thinly, broadcast.

#### Kohl Rabi

Seeds of this vegetable should be sown in rows and later thinned out to 10 inches apart in the row. Early White Vienna is an excellent variety to grow. A fairly rich soil is required.

#### Horse Radish

Roots of this are used by many good cooks, and a few clumps planted in

the garden now will supply your needs. The roots must be planted four inches deep.

#### Peas

Continue to make successional sowings of the early varieties, Little Marvel and Alaska, as mentioned last month. Apply the sprinkler and irrigate where possible to assist germination. The seeds may also be soaked 12 to 14 hours before sowing.

## January in the Ornamental Garden

### Northern California

Written for California Cultivator By A. R. Gould

ANY of our readers may have a spare plot on the ranch or near the residence which may have a few trees here and there, and the situation may lend itself to the formation of a wild garden and it may not mean the expenditure of much labor to so transform this spot into nature's fairyland.

#### Hints on the Formation of a Wild Garden

While there will be a little planning to do it will not be necessary to make straight paths or square flower beds. It is the informal effect which we have to aim at, and to attain this we must endeavor to copy nature in its wild ways. If a few paths are required they should be winding, and the plants should be grouped to conform. Native shrubs may be used with effect, and among these we might mention the beautiful ceanothus of which thrysiflorus, arboreus, tomentosa and divaricus are all good varieties. Other fine flowering shrubs are Calycanthus occidentalis, Carpentaria Californica, Romneya Coulteri "Tree Poppy," and Freemontia California. Among the berried shrubs are the "Madrona," Arbutus Menziesii and Heteromeles arbutifolia, "Toyon." These shrubs should be grouped and here and there large masses of foxgloves, iris (German) and forget-me-nots may be plac-

ed. Beds of violets also look beautiful. Many charming effects may also be secured by massed planting with bulbs, and crocuses, snowdrops, snowflakes, daffodils and narcissus lend themselves to this work. Then there are many wild ferns such as the Woodwardia, Lomaria Aspidium rigidum and Adiantum pedatum, which can be grouped around the base of trees. For a good ground cover in almost any situation plant the English ivy and allow it to ramble.

#### Violas and Other Spring Flowers

Violas, primulas, polyanthus, primula auricula, aubretia, double daisy, alyssum saxatile and Arabis may all be planted out now, and in a few months will supply lots of color.

#### Gladiolus Early Flowering

If not already planted secure bulbs of the early flowering types; Blushing Bride, Peach Blossom, The Bride and Ackermanni. They should be planted three inches deep and eight inches apart.

#### Some Little Known Bulbs

Among the little known bulbs; but which deserve more attention owing to their charming flowers, we recommend you to try the following in your garden. Muscari or Grape hyacinth, blue and white, and the feathered type in purple; sparaxias, Scilla siberica, ixias and snowflakes, Leucojum Ver-

## Grade Potatoes

From Washington comes appeal that potato producers should be progressive and as an inducement to progressing and standardizing the output of the potato fields, attention is called to the accomplishment of California fruit growers and of the apple growers of the Pacific Northwest and their excellent work in standardizing packs of fruit on the entire Pacific Coast, giving a practical guarantee of quality. New York apple growers have been forced by competition to use almost equal care in their packs. Regarding potatoes Southern potato

growers' associations have graded potatoes for years and marked their best grades. In the poor marker year of 1915 practically every car of 10,000 sent out by one southern association was sold direct. The buyers knew just what they would get from this association and took its stock at a fair price, while ungraded potatoes went begging. Other shippers' associations and many large growers have recognized the trend of events and would have graded all their potatoes, even had the food administration not required it. Be up-to-date, then, and grade your potatoes.

Getting Ready for War Crops

A tractor hauling three disks, saving man and horse power and doing things for "Production, Profit and Patriotism."

**Officially Inspected Sealed and Passed as KEROSENE BURNERS**

**A Wonderful Invention**

**Avery Gasifier—Turns Kerosene Into Gas**

**WE** have discovered the way to burn kerosene more successfully than it has ever been done before in a tractor. Avery Tractors burn *all* of the kerosene instead of wasting part of it on account of it not being fully vaporized. Avery Tractors burn kerosene so successfully that we are able to use the lubricating oil over and over again instead of using it only once and then wasting it. Avery Tractors don't just run on kerosene—they burn *all* of the kerosene.

Avery Tractors are equipped with double carburetors. The motor is started on gasoline and when it warms up you pull the lever and switch over to kerosene without having to make a single adjustment of any kind.

But while a carburetor will mix gasoline with air and form a gas, no carburetor has as yet been designed which will successfully handle kerosene. We accordingly place on each cylinder head of an Avery Tractor our Duplex Gasifier, which takes the mixture of kerosene and air as it comes from the carburetor and so reduces the particles of kerosene and mixes them with the air as to form a gas that burns more successfully than kerosene has ever been burned before. Avery Tractors are the only tractors with double carburetor and duplex gasifier fuel system.

**The 1917 National Tractor Demonstration proved Avery Tractors to be real kerosene burners.**

The rules of the demonstration were that a tractor which burned kerosene was allowed only 5% as much gasoline as kerosene for starting. Avery Tractors did more.

—They burned kerosene without calling for any more gasoline for starting during the entire week than the 5% allowed for the first day's filling of kerosene.

—They burned kerosene without a lot of black smoke coming out of the exhaust.

—Without kerosene passing the pistons and cutting the lubrication—the oil in the crank-case did not have to be changed.

—A couple of sizes Avery Tractors even burned distillate.

**Get all the Facts** There is a size Avery Kerosene Tractor to fit every size farm—six sizes, from 5-10 to 40-50 H. P. There is also a size Avery Tractor Plow and a size Avery Thresher to fit every size tractor. Write for a free copy of the new 1918 Avery Catalog and get all the facts. Address

## Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Suckers on Roses

Is the circumstance of rose canes having seven leaflets instead of five, as in the case of budded roses, infallible evidence of their being suckers of the wild stock? Some of my bushes have only five leaflets. They are mostly old and have been much neglected.—Subscriber, Ontario.

Budded roses are not confined to a five lobed leaf, for many have seven. In Souvenir du Pierre Notting, for example, nearly all leaves are seven lobed, and this is the case with several others, but a decided majority have but five lobes. Even the wild roses used for budding upon have from three to seven lobed leaves, and some species and varieties, both budded and wild, often have nine lobed leaves. The only way of judging your suckers, except they bloom, is by the quite different appearance and habit when compared to the budded portion. As a rule the wild rose has a thorny leaf, and there are often a pair of hook-like stipules, or leaf thorns, on the leaf stem near the base.—E. B.

### Book on Floriculture

What book on floriculture, written in California, especially by home talent is, in your opinion, the most reliable, exhaustive and instructive? —Subscriber, Ontario.

"The Garden Beautiful in California," written by Ernest Brauntun, published by Cultivator Publishing Company, Los Angeles, will, we believe, answer these requirements. The price is \$1.00.

### Strawberries in Stanislaus

Can you tell me what variety of strawberries would be likely to do well in this section? The soil is heavy—rather adobe like on this particular farm.—Subscriber, Modesto.

Two of the most popular and all-round varieties we can recommend are the "New Oregon Improved" and "Everbearing." The first named is a large firm rich berry, dark red in color extending to the center and has a very sweet flavor. It is practically unequalled for table use and canning purposes. It is an early variety. The "Everbearing" is also large, a vigorous grower and is a constant and abundant bearer as its name implies. It is somewhat later than the first mentioned variety. Planting should be carried out as soon as possible and they may be planted through the rows of a young orchard or in the open field or in the home garden plot. They may be planted 12 inches apart in rows which for a small plot may be two feet apart but for field culture where it may be necessary to run the cultivator through the rows three to four feet is advisable. The essential of successful culture is fairly rich and deeply trenched soil. Where the soil is of a sandy nature farmyard manure should be applied. The strawberry requires frequent irrigation. Very few fruits are secured from the first year's planting but results may be expected the second year and after the third year the old plants should be plowed under or destroyed and new beds should have been planted with runners which form the second year, and these will then be coming in succession. This is a very important point

to bear in mind. Another is to plant very firmly if you are out for success in establishing your strawberry plots.—A. R. G.

### Milkweed

I send weed stalk showing silky floss filling of seed pod. What is this weed, and is the fibre of value, and would it be worth consideration as a cultural crop?—Subscriber, Los Angeles.

This was referred to a botanist, and he writes: "This is the common milkweed, the cotton of which was utilized by the Indians, but it has no commercial use now as the fibre is too smooth to spin. It is occasionally used for stuffing pin cushions and other small articles."

### Frost in Milo

Is the fodder of milo injurious to horses and cattle after a frost which has killed the leaves but to all appearances has not affected the thick stalks to any extent? —Subscriber, Porterville.

We have never heard of prussic acid being generated in sorghums because of frost, and think if the sorghum is cut and allowed to wilt a short time, danger may be avoided. However, as a matter of precaution, read "Poison in Sorghums" on page 19 this issue in which Professor March, physiologist of the department of agriculture, says it is "commonly thought" that the poisoning may occur after frost, but apparently this is not definitely established, and besides, note later in this article, "No instances are recorded of poisoning from the harvested crop."

### Leaf Hopper

I send insects, small green flies. They are a serious menace to my berry plants. What are they?—Subscriber, Los Angeles.

They are one of the many leaf hoppers and are very destructive, though exceedingly small, but the destruction comes from the fact that they go in droves of millions. Spraying with some form of nicotine sulphate, commonly called tobacco sprays, will control.

### Flow of Water

Am irrigating from "stands" with valves in bottom. In side of stand (eight inch concrete) one foot above bottom, or valve, there is a two inch round outlet. When irrigating water stands in stand 5 1/2 inches above top of outlet how much water am I using? —Subscriber, Pomona.

There are a good many conditions which affect the flow of water in pipes, but in this case we are assuming that the pipes are smooth, that there is but one outlet pipe being used and that the outlet pipe does not project inside the concrete stand pipe. In that case the flow will be 35.3 gallons per minute. If more than one outlet is used there will be crosscurrents in the stand pipe, and the flow of each pipe will be reduced a small amount. If the outlet pipe projects inside the stand pipe but a small distance the flow will be materially reduced.

The rule for determining the flow through such openings is rather technical but Bulletin 247, University of California, Berkeley, gives very complete tables on the flow of water. Some of the catalogues put out by pump manufacturers also give tables which can be used. If anything more technical and exact is desired get "Flow of Water," D. VanNostrand Company, New York.—J. B. N.

## Beekeepers Convention

Enthusiastic Meeting Held at Exposition Park, Los Angeles, Plans Cooperative Buying and Selling.—By A. Layman

**T**HE state beekeepers even surprised themselves by their getting together so completely and setting into action forces which will mean much for the industry. The meeting was held in Los Angeles, so the greater part of the attendants were from the southern end of the state, but Secretary Richter, Prof. Lynch and others came from the north and united in the plans for an organization which will mean more money for producers, which means more honey will be produced in the state. F. A. Alexander of Ontario is president of the state association and M. C. Richter of Modesto is secretary. As the president and the secretary were both scheduled to take an active part in the discussion, L. L. Andrews of Corona presided and J. A. Mack of Bloomington acted as secretary. President Alexander spoke on the necessity for cooperation, giving instances wherein exorbitant prices have been asked for bee keepers supplies, whereas a bit of information on market and their conditions might have led to much more economical buying. There would be saving in cases and cans as was indicated in one instance when San Bernardino producers got together with samples of honey, securing much better return than any one individual member in the county association had been able to secure.

Professor Lynch of Stanislaus County referred to a similar case when for 75 cents each cases had been purchased which other bee keepers later paid \$1.35 for. They also united in selling their honey at 13 cents per pound where isolated bee keepers had to sell as low as seven cents.

Mr. Ross of Imperial County called attention to the necessity of standardization, for the using of a brand which would show to the buyer that the contents of the case was guaranteed and assured.

Mr. Wells of Ventura County spoke of the bean producers saving literally millions of dollars for themselves by organizing a Bean Producers' Association. Buyers brought pressure to bear and wrecked the cooperative association for one year, which was sufficient to teach the producers to get together for the next year, and now the association is in most satisfactory condition.

State Market Director Weinstock was present and made an appeal for

## Ten Million Dollars

Congress, to increase next year's crops, has made this appropriation to bring Nitrate of Soda, at cost, from Chile. "What Nitrate Has Done in the Farmer's Own Hands" will be sent to you free if you send your address on a post card.

**DR. WILLIAM S. MYERS**

Director Chilean Nitrate Committee

P. O. Box 248, Berkeley, Cal.

cooperative effort, suggesting the election of a board of directors of which a representative of the state market commission should be one.

Appeal was made for perfecting the organization because it would afford opportunity to accomplish great good for individual members with the consumer and for the nation.

At the afternoon session the committee which had been in consultation with Mr. Weinstock reported in favor of the perfecting of a buying and selling organization. To that end they recommended that another general meeting be held on January 12, to receive more definite outline of the organization from a committee which was elected at the meeting. This committee consists of Messrs. Ross, Imperial County, Lowe, Tulare County; Oates, Monterey; Whiteside, Ventura; Brown, Orange; Whitten, San Bernardino; Alexander, San Bernardino; Kerr, San Diego; Dickenson, Merced; and Richter, of Stanislaus.

The feeling generally obtains that the association should not only enter into the actual buying of supplies and selling of the output of the members, but should aid in financing honey producers in order that the crop need not be forced onto an unwilling market as is sometimes necessary.

The State Bee Keepers' Association is one of the oldest organizations in California and has accomplished much good for the bee keepers who have been loath to give up their independence and form a thoroughly effective organization. We believe they now appreciate the necessity of such action and that a working organization will be perfected before the next honey crop.

## Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

### Injured Eye

Cow's eye inflamed, with matter forming at first, followed by bloody discharge. Continuous with clots of blood sometimes. Blood seems to come from the corner of the eye. There are spots on the eyeball that are somewhat inflamed.—Subscriber.

The eye may have been injured by a briar or foxtail getting under the lid. Turn the lid back and examine the eye carefully. Wipe it with surgeon's cotton dipped in warm water that has some borax in it. Keep the cow during the day where the eye is not too much exposed to the light. If any little red spots appear that look like a growth touch them with a point of lunar caustic.

### Paralysis at Calving Time

What can we do to help a heifer that seems to be paralyzed in her hind legs? She has been down eight days now. She can use her front legs all right and seems perfectly well. Eats heartily and does not suffer in the least. She only seems to have no use of her hind legs. She will be fresh soon and that seems to add to the difficulty.—Subscriber, Dos Palos.

Those who treat diseases of cattle are frequently called to prescribe for just such cases as you describe. Why cows become paralyzed just at calving time is not known. After the calf is born they usually recover. While down they should be given feed that

will digest easily and should be turned from side to side twice a day or oftener. The back and across the loins should be rubbed twice a day and a good liniment applied. A good liniment for that purpose is made of equal parts of turpentine, camphor, oil of origanum and aqua ammonia. For internal treatment give her these powders: Ground gentian four ounces, powdered nux vomica two ounces, bicarbonate of soda four ounces and farina enough to make one pound. Mix and make into 15 powders. Give one powder morning and evening.

### Diarrhea in Cattle

I am writing for advice about some cows that are physicked very much while eating alfalfa hay. The hay looks good but the cows are drying up in the milk. Please advise what to do for them.—Subscriber, Coalinga.

There are many causes for diarrhea in cattle. It may be due to foul drinking water, musty hay or to a contagious disease that is very fatal. Let us hope that it is not the latter. If the water they drink comes from a stagnant pool or there is any danger that the source may become contaminated with any drainage then see that the conditions are improved.

If the hay is musty or was allowed to heat while curing it is best not to use it. Change the conditions that you think may be the cause of the trouble and get the following medicine: Mix a full tablespoon of zenoleum in a gallon of water and give each cow half a pint of the solution every morning as a drench or sprinkle it on the hay. Also give each cow at night a powder containing one dram of ginger, two drams of gentian, one dram of bicarbonate of soda and five grains of tannic acid. I would advise giving each of the cows affected one of the powders every night for ten days. Multiply ten by the number of cows affected and you will know how many powders to get. Show this to your druggist and he will know what to prepare for you. Give the powders mixed in a pint of water as a drench or mixed in a little feed if they will eat it that way.

### PAIRING AND PARING

"So your constituents objected to your absence from Washington?"

"Yes," explained the representative.

"Didn't you tell them that your vote was paired?"

"Yes; and they said that they would see to it that it was paired still more when I came up for re-election."—Buffalo Express.

## NORWALK TIRES

These casings never falter—they are built so strong and supple that they are difficult to puncture or stone-bruise, so expertly constructed that their use is brought to an end only by the actual wearing-out process after months of hard usage. Satisfaction guaranteed. Adjustments are based on 7500 miles for Ford sizes and 6000 miles for larger sizes when used under ordinary motoring conditions. Ask for Price List.

Factory Distributors

### Bargains Bargains

## Mandy Lee Incubators

We are selling out our line of Mandy Lee Incubators. While they last we will offer the 140 egg Mandy Lee Incubator for \$16.00, F. O. B., Los Angeles. These machines are a snap at this price. Six patented and distinctive features. Absolute satisfaction guaranteed. A few of the other sizes for sale. WRITE FOR CATALOGUE.

### Globe Grain & Milling Co.

913 East 3rd Street  
Los Angeles

### Reliance Irrigation Meter

For Open Ditches, Reservoirs and Gravity Pipe Lines

The Reliance Meter is recognized by water companies and irrigators to be the most accurate and impartial method of measuring water. Send for Copy of the Water Watch

**Hydrometric Co.** 955 North Main St.  
Los Angeles, Cal.

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

## THERE'S BIG MONEY IN HOGS IF

They are properly fed. Successful hog feeders everywhere have demonstrated this fact.

## High Protein Hog Tankage

Is the perfect balancer of hog rations that produces healthier, heavier hogs, quicker and at less cost.

Send today for our free booklet "Profitable Hog Feeding." It tells how you can make your hogs pay.

**WILSON & CO.**

1000 Lyon St., Los Angeles. Santa Barbara, Riverside, San Diego

## Make Your Land Produce the Limit

Plant a CITRUS orchard and intercrop same while prices are good, you can succeed by planting the best CITRUS TREES. We offer several thousand selected LATE VALENCIAS, EUREKA LEMONS, M'S GRAPEFRUIT, and WASHINGTON NAVELS. Extra fine stock, prices on application. INSPECTION INVITED.

**Haster Bros., R. D. 2, Orange, Cal.**

### 4 H.P.-190 lbs.

The 4 H. P. Cushman Handy Truck is the most useful outfit ever built for farm work. Engine weighs only 190 lbs., and entire outfit only 375 lbs.

Besides doing all farm and household jobs, this 4 H. P. Cushman may be lifted from truck and hung on rear of binder during harvest to save a team. In wet weather it saves the crop.

### Light Weight Cushman Engines

Built for farmers who need an engine to do many jobs in many places instead of one job in one place. Throttle Governed, with Schebler Carburetor. Run very quietly and steadily—not with violent explosions and fast and slow speeds like old-style heavy-weights. Engine Book free.

CUSHMAN MOTOR WORKS  
804 N. 21st Street Lincoln, Nebraska

### 8 H.P.-320 lbs.

### With the RED JACKET

for beans, potatoes, tomatoes, peas, celery

An automatic, splendidly built, convenient sprayer, with 70 or 100 gal. tank, adjustable wheels, two or three plunger pump, maple platform that resists all strains. Automatic brush cleans suction strainer; no danger of clogging.

Just one of a host of sprayers shown in our 1918 free Catalog. Also send 10c for handsome Spraying Guide, 94 pages

FIELD FORCE PUMP CO.  
Dept. 7  
ELMIRA N. Y.

### "The 'Acme' Way to Crops That Pay"

is the title of our free book that points the way to increased yields. Shows how to secure deep, firm, moist seed beds without waste of time or labor. Fully describes the "Acme" Tillage Line and explains "Why the Coulters Do the Work" in field, orchard and garden better than it can be done in any other way. Gives the findings of State Experiment Stations in every part of the country.

This book will help you to grow bigger crops. Send a postal today

DUANE H. NASH Inc.  
651A Brannan St.,  
San Francisco, Cal.

If you were busy being right, You'd find yourself too busy, quite. To criticise your neighbor long Because he's busy being wrong.

## When to Blast Ditches and When Not

Written for California Cultivator By J. R. Mattern

HERE are four chief methods of making ditches, each of which has its place and time. These four methods are hand digging, plowing, using ditch excavating machines, and blasting. A brief statement of the proper use of each may help to make clear in the minds of many who are puzzled just what are the possibilities and impossibilities of blasting.

Plowing, with either horse or engine power, is by all odds the cheapest method for making ditches less than 12 or 15 inches deep. If the desired depth can be reached effectively with a plow point with not more than three furrows in one, that is, the second and third in the bottom of the preceding one, the plow is the thing to use. If you have to run more than three times in the same place you should look for some better method.

Hand digging is the most expensive method except for very short sections, as in a garden or on home grounds. It is probably the best way for the average farmer to make ditches for tile drain pipe, though tile ditches can be made with a ditch digging machine. The machine will cost about as much as a traction engine. Its chief place is where there are miles of tile to lay. These machines are made by various companies and are frequently advertised in the farm papers.

Blasting out the ditches is the method that should be used whenever a ditch is wanted deeper than 12 or 15 inches and where tiles are not to be laid. It now is an accepted fact that satisfactory ditches can be made with explosives. With a proper amount of material you can move the material for such ditches for less, in all probability, than it can be handled in any

other way. But the big point in favor of blasting is that the work is reduced to a minimum. This gets the ditch made quickly and gets it done with only one or two men, factors extremely important on many farms.

If the blasting is done when the ground is properly damp or wet, and you experiment with a few shots before beginning the work on a large scale, in order to get the right effect the blasted ditches will be straight and smooth and will not have a great deal of loose material in the sides and bottom. Plow a furrow along the line of the ditch or cut the ground with a shovel. Better still, plow two furrows, one where you want each side of the ditch to be. This is important if the ground is covered with sod, in order to prevent the sod from merely folding over the edges of the ditch or from falling back into the excavation.

If there is a good fall and the water volume is at the time large, comparatively speaking, you can blast a shallower ditch than if the land were flat and the flow small and sluggish, and still take care of the same volume of water. The swifter stream will scour out the channel where the slower water would merely dam up. It is entirely practicable to deepen existing ditches and streams with explosives, placing the charges right down in the earth under the water. In fact, it is under such difficult situations that the use of explosives will be most appreciated. It is hard to dig or plow any kind of a ditch through a swamp, particularly if there are trees and brush to fill the ground with roots. But you can blast a channel right among these obstructions, and have it clean and straight, with little shovel and axe trimming afterwards.

## Worth While to Know Beans

IT IS worth while to know beans," says the Fresno Farm Bureau Monthly. "This is evidenced by the fact that three farm bureau bean meetings have been held during the fall at the request of bean growers themselves. Some interesting experiences were related at the bean growers' meeting held in the Fresno County Chamber of Commerce Building, December 1. Manager S. P. Frisselle of Kearney Vineyard has found from a careful system of cost-accounting that beans were produced at a cost of from \$26 to \$32 per acre at Kearney Park. Kearney is making excellent use of bean straw. Two loads of bean straw are run through a cutter with one load of alfalfa hay. The chopped mixture is being fed to cattle and sheep. Mr. Frisselle considers his bean straw worth at least \$10 per ton. Evidently the estimate that any bean straw in fairly good condition is worth at least one-third the value of alfalfa is conservative."

As to value of bean straw, Prof. F. W. Woll says:

"Straw from leguminous crops, beans, peas, etc., is somewhat higher in nutrients than cereal straw, but is generally coarse-stemmed and less palatable to stock than the latter. Lima bean straw is commonly fed to cows, horses and sheep in the south coastal counties of the state and is considered of nearly similar feeding value to good grain hay or fair grades

of alfalfa or clover hay. In order to avoid waste in feeding, it is preferably run through a cutter and either fed alone or mixed with feeds, like silage, sliced roots, or concentrates."

### SAVE YOUR FARM MACHINERY

Now is the time to build an implement house on your farm if you do not already have one. The price of everything is up. The building will cost approximately twice as much as it would have cost one year ago. Nevertheless a shed just now, if you cannot afford a structure worthy of the name of house, will bring in greater returns than it could have at any time in the past decade.

This is true because the price of machinery is also high. It is probably higher in proportion than lumber. Furthermore, so much iron and steel is going into the manufacture of munitions at the present time, and more will go in the near future, that there is every likelihood that there will be an implement shortage. We might not miss it far to say there is a shortage now. In one particular line, the tractor, there has certainly not been an over-production.

It is impossible to foretell what the future has in store, but it is a wise man who prepares.—E. R. Gross, Colorado Agricultural College.

Men don't gossip. They repeat rumors.

## VALUABLE PRODUCTS FROM NATIVE PLANTS

The yucca plant, or Spanish bayonet, common in the hills of Southern California, is now being used for the manufacture of brooms. Another species of the yucca is used for the manufacture of surgeons' splints and is being experimented with for use as artificial limbs.

The common manzanita bush, grown everywhere in California, may be of value in dye making. A carload of stems and roots was recently shipped from Northern California to an Eastern dye manufacturer for experimental purposes.

The root swellings or burls of the wild lilac are proving valuable as a substitute for briar in the manufacture of tobacco pipes.

Bay rum, used in toilet preparations, is manufactured from the California bay tree, and quinine is produced from the wild quinine bush that grows widely over the southern deserts.

### THREE DOLLAR RATS

An Eastern writer has said that the destructive "value" of a rat is approximately \$3.00. We imagine the "value" of some of the smallest mice might be, at times at least, above such a mark. The gopher and the jack rabbit may not be so "valuable," but they are worthy of a whole lot of attention. How much of our crop is being taken by these rodents? We do not necessarily insist on an exact answer, but everyone who is endeavoring to be patriotic these days should take time to eradicate the pest, if he does not take time to figure out the exact "value."

### FARMERS' SHARE OF THE LOAF

That farmers are today receiving for their wheat 40 per cent of the money paid for the cash loaf whereas last year they received less than 20 per cent of the price of the loaf is a recent announcement of the United States food administration. Elimination of hoarding and speculation together with stabilization of prices are responsible for the doubled share of the retail price farmers are now receiving.

Most of the tractors now on the market are thoroughly reliable. The engines are highly developed due to years of experience in automobile manufacture. The tractor as a whole has passed the experimental stage. The big question for the farmer to decide is the size and character of tractor that will be most profitable on his farm.

With such a tractor you can turn two or three furrows where before you turned only one; you can move the plows across the field twice as fast; you can plow earlier in the season and deeper; preparing a seed bed so soft and porous and so early in the season that the early rains will be absorbed instead of running away, thus storing the moisture for faster, thrifter growth in your crops and as a safeguard against drouths and resulting crop failures.

C. C. Townsend, pathologist in charge of sugar plant investigations, recommends more liberal use of lime on beet lands, at least where content is known to be low. He says lime has been found generally beneficial in sugar beet production and recommends especially the use of sugar factory waste.

Some men may dig their graves with their teeth, but more use a corkscrew.

## Poison in Sorghums

THE sorghums are proving amongst our most valuable plants as grown for fodder and grain. They give great returns from every acre which has fairly good care. They all have one unfortunate trait, that of becoming poisonous to stock under certain conditions. We have written the department of agriculture as to the best information on this subject, and C. D. March, physiologist in charge of poisonous plant investigation, writes as follows: "In reply to your letter inquiring about the poisoning of cattle by sorghum, the following brief statement may give the information desired:

"Many fatal cases of the poisoning of cattle have occurred in different parts of the United States, but most of them have been in the semi-arid regions of the West.

"The actual poisonous principle involved is supposed to be prussic acid, which has been found present in considerable amounts in some cases. The prussic acid seems to be formed in larger quantities when the plants grow under conditions of drouth, and this may account for the fact that the great majority of the cases occur in the West. Second growth sorghum is more likely to be poisonous than the

first growth, probably because the conditions for the formation of the prussic acid are more favorable. It is commonly thought, too, that poisoning is especially apt to occur after the plants have been subject to frost. The cases of poisoning are acute, death resulting in a short time, and from very small amounts of the plant. Apparently, the poisoning cases occur only when the sorghum is grazed. No instances are recorded of poisoning from the harvested crop.

"Theoretically, it should be possible for a chemist by a determination of the amount of prussic acid to tell whether a particular field is poisonous or not, but practically, this is very difficult, for the prussic acid is not present in a stable form, and the quantity may vary greatly between the time of collection and that of examination.

"The farmer, then, should remember that while sorghum is ordinarily harmless, it may be very poisonous under certain conditions. He should, therefore, use great care when turning cattle upon sorghum, especially when it has grown under unusual conditions of drouth. It is best to put in only a few animals at first, and to watch carefully for any symptoms of poisoning."

## A Fair at Los Angeles

President Miller of the District Fair Association of California writes that the board of directors is planning to begin the New Year with first steps for a great fair to be held at the grounds and buildings at Exposition Park, Los Angeles in October, 1918. Plans were in the making last spring for an October or November fair

000,000 quintals, and while the submarine menace has been controlled in a measure there is still an enormous shortage of shipping facilities, but these are increasing every day, and this country must be prepared to meet the need of France if her armies are to aid ours. We believe, and the board of directors believe, that no step more important can be taken than a show-

Where Man Power Comes In

This beats the hand hoe. It's a Planet Jr. and a labor saver worth considering these days of man power shortage.

last year, but with Red Cross drives, with appeals for every bit of the nation's energy being given directly to the prosecution of the war, and still more with the lateness in beginning the planning, it was decided to discontinue the work and hold the fair the coming year. Now the work is beginning in abundance of time and with the belief that there is opportunity for a great work in the aid of war plans. Since the first intimation that America might enter the war, the need of more food has been enlarged upon until we almost tire of hearing of it, but day by day it is becoming more apparent that the need is far more pressing than was ever predicted. France is suffering and must be supplied at once, for her 141,000,000 quintals wheat production decreased during the past year to little more than 41.

ing of the resources of the Southern part of the state and showing of implements and appliances whereby those resources may be greatly increased. The holding of the fair will also increase production in contemplation of such an event. Los Angeles is wise in this early beginning of its planning.

### COTTON IN SAN JOAQUIN VALLEY

San Joaquin Valley is becoming deeply interested in cotton production. A meeting was recently held in Fresno to discuss the topic, and this meeting was only one of several which have been held. Professor Gilmore of the university is giving aid in determining as to the conditions of the valley and those required by the crop, also W. E. Packard, assistant state leader of farm advisers, and several of the farm advisers are joining in this investigation. In any case another season will see a more general experimental planting than any preceding year.

## OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

## THIS WEEK'S COVER

In Yolo County is Woodland, likewise wooded land, for there are thousands of such trees as the one shown on the cover page. They add thousands to the wealth of Yolo County, not because of the intrinsic value of the timber, for it has slight value, but as shade trees and as an addition to the landscape they add wonderfully to Yolo's attractiveness.

Spare the big trees; better, plant more, for this state needs trees.

## NEWLANDS

Senator Newlands has gone. He made a persistent fight for the interests of the West, and we believe that he was right and that the entire nation would have benefited had he won in his efforts, especially those that had to do with conservation of our resources. We hope that another will be raised to take up the work of Senator Newlands.

## LOOK TO THE FUTURE

Protectionists are bringing to the attention of congress the situation which may prevail in this United States when the war is over, or, rather, conditions which may prevail the world over which will place American farmers and American manufacturers in a most embarrassing position. It is a wise man who can anticipate exactly the conditions which will obtain, but it is well that some of our brightest minds are looking ahead and anticipating and suggesting a safety first program.

## ROMINGER BILL

Now begins the fight for a seamless California. The Rominger bill is legally before the people for their decision at the next general elec-

tion. The secretary of state has accepted the petitions filed as sufficient, and believers in the wiping out of an institution which has nothing to its credit and untold suffering and economic loss to its debit feel that the campaign is already won. Total prohibition may come as a constitutional amendment, but this will require a six-year fight. Meanwhile, it is a satisfaction to believers in California that the state is preparing to take this advanced step.

## KEEP OUT THE PESTS

The Massachusetts Forestry Association is making a special war measure campaign against admission of horticultural or other pests to this country. This association refers to the Hessian fly, an introduced pest, which costs the wheat growers of this country \$50,000,000 annually. The codling moth costs the apple growers over \$16,000,000. The San Jose scale takes another toll of \$10,000,000. There are others without limit.

This campaign is timely and was pressed by Pacific Coast horticulturists long before Eastern producers awakened to its necessity. Strength to the arm of our horticultural quarantine service.

## TAKING THE BEANS

The Lima Bean Association and various bean buyers have received from Paymaster McGowan of the navy requisition for beans in various warehouses: "This order mandatory as material is urgently needed by the navy. The navy assures you fair and just profit on this shipment."

Still the growers are somewhat concerned as to what a man 3000 or 4000 miles away will consider a fair and just profit on beans grown under Pacific Coast conditions. However, this is a period of war, and immediate action is necessary. Later, should it prove that injustice has been done we believe it will be fully righted. In any case, the bean grower should plan for another and a greater crop of beans.

## LIES

"Secretary Tumulty has been executed because of his being a German spy." "Because of Irish disloyalty President Wilson has ordered all Catholics removed from public office." "The sweaters knitted by the patriotic women for the Red Cross are sold in the open market." "Soldiers in the cantonments must buy their food or starve." And a few similar stories are given far more circulation than they should be. The state council of defense is issuing warning and urging all who are patriotic to look with reason on the lies which are being circulated at every possible opportunity.

Possibly Americans are not acting as one man, but we believe 99 per cent of them are absolutely patriotic and standing behind the government in every way.

This was never the case in Russia, yet there was fair fighting capacity in those people as long as a fairly united government was behind or with them. The administration in conducting America's war will be effective so long as it is supported by the people, and while that support is not simply a condition of mind, that has much to do with the spirit of the boys in the field as well as of the administration at Washington. Enemies of our country know well what it would mean to create dissension among us.

Let us stand as one until the war is finished and finished right. Meantime pay no attention to the lies but bean the liar.

## CLIP THE COUPONS

The agreeable feature of the liberty loan is now being realized by millions of Americans. Since December 15 coupons have been cut and turned in to the banks and to every money order post office with a satisfaction that is not merely because of its proof of thrift nor because we have a few cents added to our spending money but because of the part we are taking in preserving Liberty for the world. Then we are all the more ready to answer the call of our government for the next, or third, liberty loan bond issue which is promised in February.

By the way, boys and girls of California, remember those thrift stamps. Take every penny out of the little toy bank and invest it in stamps until the requisite 16, with a few cents more, will secure a war savings certificate. Then, instead of lying in the little banks the pennies will be drawing interest. Besides, it will make everyone of us feel more a part of the government and the great work we are doing in our fight for liberty for the whole world.

## INVOICE

On page three are suggestions regarding making return or report regarding income for past year. The new year is a good time to "take stock." Wise merchants, often twice a year, at least once a year, make invoice of stock in hand and know where their business has made and likewise where it has lost money.

There are some farmers who are specializing on one crop, and if they manage to live and eat and dress fairly well, they decide that that one crop has made a living for them. However, there are many more farmers who are handling two or several crops and too often do not know which are the makers and which are the losers.

Aside from this taking of stock and keeping records of ranch losses and gains, the income tax, which in some form will doubtless be with us for all time to come, should impel everyone to keep most accurate account of every transaction. We once heard a farmer say that the last thing he wanted to know was the unfavorable features of his business. But such a spirit makes for weakness of any business man. In order to meet the demands of our government everyone with an income of \$1000 or \$2000, as the case may be, must make report. The man who honestly has an income which justifies payment of an income tax must be able to show what that income is and what right he has for exemptions. There are exemptions allowed, and it is necessary that the farmer make clear statement of all his operations in order to secure these exemptions.

These preachments come a bit late, perhaps, for the past year's report. For that, presumably, many of our farmers will have to use the rule of thumb and report as best they can, but this is the beginning of the new year and if the farmer will but take stock and keep books through 1918, then on December 31, 1918, another taking of stock will enable him to make an accurate report and to show wherein he is entitled to pay and entitled to receive exemption.

## LOS ANGELES BUREAU

Los Angeles County begins the new year fully organized as to its farm bureau and with the appointment of Dr. J. Elliot Coit as farm adviser and Mr. Hodgen as first assistant; other assistants not yet appointed. Dr. Coit has been connected with California horticulture and agriculture for many years, at one time being at the head of the experiment station at Riverside, and many years since professor of citriculture and subtropical fruits at the University of California.

## This Week's War News

Rumor has it that Japan will send a big army to the Western front.

The Allies are slowly driving back the Teutons in northeastern Italy.

The clamor for peace on the part of the German people is increasing daily.

England is now under a strict food ration program; sugar is issued only by card.

A food survey of the situation in America is called for and the work has already been undertaken.

The lines have been advanced ten miles north and east of Jerusalem and the general situation made more safe.

Los Angeles led the country in abolishing the teaching of German in the schools and many other towns have followed suit.

The railroads and coast and river transportation lines of the United States have been under federal control since 12:00 M. December 28. Interurban and street car lines not included in the order.

Twenty dergees below zero and a 60-mile blizzard has affected the coal situation and caused immense suffering over much of the East. The navy has released one-half of its stored coal to lessen the suffering.

More German "peace" propaganda is evidenced in the incendiary fires which destroyed great munition plants at Norfolk, Virginia, January 1. Several lives were lost. Arrests of several aliens have been made.

The entrance of Argentine into the war on the side of the Allies makes South America almost unanimous. Practically the only nations of the south sympathizing with Germany are Columbia and possibly Chile.

On the seas the principal events of the week have been the sinking of the big Cunarder, Venovia, with large loss of life and \$2,500,000 financial loss in ship, munitions and food; the sinking of three British destroyers and the sinking of several U-boats.

In California a member of the council of defense has retired, and there is show of friction, the retiring member declaring that the \$500 per month paid to the vice president of the council, and other extravagances are not justified by the accomplishments of the board.

The pro-German claim that General Sarraill was recalled from the Saloniki section because of any contention is denied; the French assert it was because of his own request. He has been in command of the international armies at Saloniki for two years.

On the Western front there has been almost continuous cannonading over the whole line, with some activities in the Cambrai and Verdun sectors. In front of Cambrai the Germans captured some British trenches which were almost immediately retaken. German troops are still being transferred from the Russian front.

Peace is being discussed as never before and both sides concede the situation calls for mutual concessions. The old year ended with Germans gaining because of the collapse of Russia and because of its drive in Italy. The Allies are gainers because of the persistent driving back on the Western front and of final winnings on the Italian front; also in almost perfect possession of the seas and practical collapse of the submarine warfare. Their greatest gain for the year has been the entrance of America and several South American republics. The peace proposals of the Bolsheviks, at first ignored, it now appears will be answered by the Allies. The fighting spirit of the French, and in fact of all the Allies, and the feeling of unity among the civilized world, is an earnest of the determination to make peace only the outcome of right settlement of the situation. The people of Germany are likewise insistent in demands for definite step toward peace.

# Agricultural News Notes of the Pacific Coast

## Northern California

The pack of 1917 Navels is practically ended in Butte County.

California has now planted nearly a half million acres of wheat.

San Joaquin County is making a campaign on ground squirrels.

Sonoma County poultrymen have abandoned plans for a breeders show.

San Francisco is planning for a truck and tractor show February 16-24.

An investigation in Butte County has shown over 200,000 idle acres which are tillable.

Sutter County reports its bean crop safe in the warehouses. Over 600,000 sacks were harvested.

The Shasta County farm bureau is discussing irrigation with experts from the University of California.

Napa County orchardists report oak root fungus as doing much damage in some of the deciduous orchards.

Some Orland County farmers are raising two crops annually and netting around \$140 to \$150 per acre.

With hay highest since the 60's, dairymen and livestock feeders are turning every way to secure relief.

The University Farm at Davis, will soon have a fine Percheron stallion, a winner at the Chicago International.

The Butte County farm bureau is making life miserable for ground squirrels through a campaign of eradication.

The section near Walnut Creek is producing rabbits so extensively that they are erecting a cannery to handle the surplus.

Plans are practically completed for the Western Berkshire Congress which will be held at University Farm, Davis, February 21-22.

Peach growers of Butte County who signed long time contracts with canners prior to the war are appealing for modification of contract.

The Pacific Coast Hereford Breeders' Association will hold big public sale of registered Herefords at the University Farm in April.

Yolo County cotton growers are pleased with experimental plantings and more liberal experiment will be made during the coming season.

Napa Grange recently met and elected officers for the coming year. The master is H. L. Gunn; overseer, H. J. Baade; secretary, Mrs. F. L. Hunt.

Shasta County is holding mass meetings and organizing its farm bureau. Glenn County and other adjoining farm bureaus are aiding in the work.

The northern portion of the valley and even some of the red foothill lands will be planted to wheat to a greater extent than any preceding year.

The county horticultural commissioner of Glenn has condemned a shipment of alfalfa seed because of large quantity of dodder seed which it contained.

Professor Gordon H. True is at the head of the federal livestock commission for California, the first work of which is to remedy the shortage of feed if possible.

The California Shorthorn Breeders' Association met recently at San Francisco and re-elected last year's officers. The Shorthorn sale scheduled for February may possibly be deferred until April.

## Central California

Tulare County's farm adviser is now on the job.

Tulare County shipped over 2000 cars of fresh fruit the past season.

The Citograph of Lindsay, Tulare County, has discontinued publication.

Tulare County's lemon crop is reported to be less than 40 per cent of normal.

Petitions are being circulated in Madera asking for an anti-saloon election April 10.

A livestock company with capital stock of \$50,000 has been organized at Greenfield, Monterey County.

All members of the Associated Raisin Company are asked to put "Sun Maid" signs in all their vineyards.

Gonzales, Monterey County, is receiving advice on bean planting from an expert of the University of California.

The state poultry show held at Coalinga last week showed more than 1000 poultry and rabbits exhibited.

There will be a meeting of the Tulare County farm bureau on January 9, when organization plans will be discussed.

The Grange Patrons of Husbandry, Dinuba, Tulare County, has resolved against the importation of Chinese coolie labor.

Cattlemen of Dos Palos, Merced County, are discussing the new branding law and have decided to unite with the State Cattlemen's Association.

Charles Klint has been reappointed official tester of the Tulare Cow Testing Association. This association is now testing about 4000 cows per month.

Kings County prices of butterfat for November dropped below the high prices of October. This is believed to be due to large shipments received from Australia.

The big Tagus Ranch in Tulare County is planning to put in 2000 to 3000 acres of beans next spring. Teparys and Blackeyes will be the varieties seeded.

The Terra Bella Fruit Growers' Association has leased its cannery for next year. It is reported that the lessee will also put in machinery to handle peaches and apricots.

A large addition is being built to the plant of the Kings County Packing Company of Armona. This plant will take up the canning of vegetables this season. It is now canning raisins.

More than 6000 head of sheep are now being fattened at the San Joaquin Valley sugar factory at Visalia. The animals are not fed exclusively on beet pulp but are given other rations.

Legal complications and a long series of law suits are promised in connection with the newly formed \$2,000,000 Lindsay-Strathmore irrigation district which contemplates taking waters from the Kaweah River.

Cotton growers of the San Joaquin Valley met at Fresno last Saturday and took preliminary steps for the organization of the Central California Valley Egyptian Cotton Growers' Association. Organization plans were placed in the hands of W. E. Packard, cotton expert of the state university.

## Southern California

Imperial Valley has shipped over 600,000 pounds of turkey.

Navel oranges have sold for longer prices than any preceding year.

San Diego County good roads boosters recently met at Fallbrook.

Imperial Valley will soon be planting over 9000 acres of cantaloupes.

The last day of 1917 was made squirrel Day by Corona, Riverside County.

A movement is on foot to establish a sorghum mill in the vicinity of Imperial.

The Yucaipa Apple Growers' Association held its annual election January 3.

The Orange County board of supervisors has made appropriation of \$2000 for expenses of farm adviser.

One of the biggest rises in war prices is in the price of peanuts which has gone up from six to 15 cents within a very few months.

The Pacific Exploration Company is drilling many depth shafts in Death Valley to discover as to the extent of potash deposits known to exist.

The Golden Orange Groves, Incorporated, at Baldwin Park, have elected Wm. Bainbridge, president, and J. M. Stanton, secretary and manager.

Los Angeles County hunters are taking up an occasional \$20 or \$30 bounty for mountain lions. They are more plentiful than for several years.

San Bernardino, Riverside and Orange Counties are uniting in appropriations to be used in aid of flood control of the head waters of Santa Ana River.

The Washington Navel crop of the Riverside district is reported to be larger than was expected earlier in the season. Eastern shipments have begun.

At the farm center meeting at Murrietta, Riverside County, attendance of nearly 100 was given. The center is uniting in purchasing bluestone for seed dip.

The first car of new crop Navels was shipped from the Riverside district last Saturday by the Highgrove Fruit Exchange. This first car went to New York.

Practically all the larger towns of this state have adopted the one delivery a day plan. Merchants in many of the cities have in addition cooperative deliveries.

The directors of the California Lima Bean Growers' Association have applied for a license although as a cooperative association they are not required to do so.

Robert Reese, tester of the Westmoreland division of the Imperial County cow testing association, reports 15 cows testing over 50 pounds of butterfat for the month of November.

Farm center meetings for Imperial County for the month of January: Alamo, 7; Westmoreland, 9; Meloland, 11; Calipatria, 14; McCabe, 16; Magnolia, 18; Seeley, 21; South Fern, 23; La Verne, 24; Mount Signal, 25; Eastside, 28.

The short course in tractor management at the Citrus Experiment Station Grounds at Riverside will be held during the week beginning February 11. A registration fee of \$1.00 is the only charge for the course and any one may register.

## The Coast and General

National forest timber sold last year totalled in value \$3,715,000.

The United States produced in 1917 more than 5,500,000,000 bushels of cereals.

Many farmers of Marion County, Oregon, are getting together and buying tractors.

It is probable that next year's sugar production of the world will be the shortest ever.

Jackson County, Oregon, can boast of having filled its army quota before the draft was made.

The inspector of weights for the state of Washington has been given an assistant and a corps of eight inspectors.

General effort has been made by forest rangers and others to clear ranges of larkspur and other poisonous weeds.

The Twentieth Annual American National Livestock Association's Convention will be held at Salt Lake City, Utah, January 14-16.

The farm agent of Cochise County, Arizona, has completed a series of nine district fairs held in the various centers of the county.

The Southwest Cotton Company predicts that 100,000 acres will be planted to long staple cotton in Arizona the coming year.

The loss of food during the last summer because of fires in field, warehouses and elsewhere averaged in value \$50.45 for every minute.

A large acreage of land in Power County, Idaho, has been summer fallowed in preparation for planting to beans and peas next season.

The long controversy between Governor Campbell and Governor Hunt of Arizona has finally been decided, and Governor Hunt took over the office on January 1.

Graham and Greenlee Counties in Arizona unite in employing one farm agent. He is now working with farmers in the two counties to produce a greater wheat crop.

At the recent annual meeting of the Idaho-Oregon beekeepers' association it was decided to sell all extracted honey through the association as the comb honey has been handled for sometime.

The Washington college of agriculture at Pullman has a new head in Dr. William J. Spillman who was formerly chief of the office of farm management in the United States department of agriculture.

The ninth annual convention of the Farmers Union of Washington and North Idaho was recently held in Spokane. A. A. Elmore of Spokane was elected president and A. D. Cross of Spokane, secretary and treasurer.

Effort is being made to stabilize livestock markets at Chicago and other packing centers by control of daily shipments into the markets. The territory supplying the markets has been divided into zones to secure more satisfactory control.

Jim Hill mustard, long a pest of the Northwestern states, especially along the right of way constructed by Mr. Hill, is now being utilized as a forage and proves excellent for sheep. One farmer reports the sale of \$8000 worth of sheep fed entirely on Jim Hill mustard.

## Winter Is When Stock Get Out of Fix

Yet—healthy, thrifty animals mean more to you right now than at any other season of the year. It's because you are producing pounds of pork, beef, butter and milk with grain, hay and fodder, the products of your summer's toil. That's why your stock should be in prime condition and free from worms.

## Dr. Hess Stock Tonic

Is a Conditioner and Worm Expeller

It contains tonics to improve the appetite, blood builders to tone up and enrich the blood, laxatives for the bowels and vermifuges to drive out the worms.

Every ingredient in Dr. Hess Stock Tonic is highly endorsed by the United States Dispensatory and other world's experts for the same purpose for which we use them.

We have a dealer in your town, authorized to sell you Dr. Hess Stock Tonic with the understanding that it is to make your stock healthy, to make them thrive better, to drive out the worms; otherwise he gives your money back.

25-lb. pail, \$2.25;  
100-lb. drum, \$7.00

Smaller packages in proportion.

Why Pay the Peddler  
Twice this Price?

DR. HESS & CLARK, Ashland, Ohio

DR. HESS POULTRY PAN-A-CE-A  
will help make your hens lay now

## Dr. Hess Instant Louse Killer Kills Lice

## MILK ..... and WAR TIME

In these days of high prices for dairy products, the "poor milker" is more than ever a liability.

But before you sell the cow that is not producing well, try to improve her condition. Her milk value is much greater than her meat value.

Most poor milkers are non-productive because of some defect of health, which can be quickly remedied by intelligent treatment.

Kow-Kure is a medicine that acts quickly on the organs of digestion and milk production. Its widely known tonic and curative qualities have made it the standard cow medicine for the prevention of disease and the treatment of Abortion, Barrenness, Retained Afterbirth, Scouring, Lost Appetite and Bunches.

Give Kow-Kure a trial; it will do for you what it is doing for thousands of others. Feed dealers and druggists sell Kow-Kure; 55c and \$1.10 packages. Send for free treatise, "The Home Cow Doctor."

DAIRY ASSOCIATION CO.,  
Lyndonville, Vt.

## Live Stock Notes from Northern California

Written for California Cultivator By W. S. Guilford

THE year 1917 has been a very prosperous one in the Sacramento Valley. Crops have been abundant and prices high. The grain crop was one of the largest ever produced. This is the big money crop. Dairy products have been high in price and the number of dairy farmers has been steadily increasing. More alfalfa has been planted, with consequent increased aggregate yield. An exceptionally long open fall has permitted the harvesting of the largest rice crop yet produced, and it has gone into the warehouses in fine condition.

Wages for all kinds of labor have been high and men scarce. Each succeeding draft makes the condition worse. What will happen next year is a serious question. One result of this is the influx of Hindus and Japanese who are finding no difficulty in renting small and large areas for all kinds of crops.

While the open weather and absence of rain has been very favorable for the harvest of the rice and bean crops, and for the fruit harvest, there is a serious shortage of feed for live stock on all hill and plains ranges. And it is so late now, and the weather so cold, that rains coming now or later will not make much feed before spring.

The high price of hay has caused many dairy herds to be considerably reduced. There is also a big shortage of hogs in many districts. Grain farmers who ordinarily "carry over" a good many and feed some grain "from the sack" have sold both hogs and grain.

The number of flocks of sheep on small farms and the larger grain ranches has increased very materially, and the time is apparently not far off when the small flock will be the rule rather than the exception on Sacramento Valley farms. Rents of range areas are increasing. Fifty cents per acre was a common price two years ago; very little is being rented for less than one dollar an acre now.

All classes of farmers are prosperous, but it is most apparent among those who have purchased subdivision tracts within the past four or five or six years. Some of these had a hard time during their first two or three years in California. Now that they are beginning to produce crops in quantity the high prices are enabling them to pay for their farms and purchase luxuries much sooner than they have anticipated or would have otherwise been the case.

Hundreds of automobiles of all kinds are being sold in every rural district. And the market for trailers is a particularly good one—I wonder that more are not advertised in the farm papers.

The silo building activity has been phenomenal; there are 65 new ones in Glenn County alone. And the planting of all varieties of corn continues to increase yearly.

And the number of pure bred animals of all kinds, both in use as sires in grade herds and in pure bred herds, has multiplied. This is a factor that means much for the increased prosperity of the live stock industry whether prices are high or low.

The Sacramento Valley is a great agricultural empire, developing rapidly now but capable of far greater development.

### BEGINNERS LOSSES

The beginner in the live stock business must expect some losses. Very fortunate indeed is the man who buys his first stock and does not have some discouraging unfortunate experience. And with almost every one there comes a time when everything looks blue and there is a strong temptation to sell everything and quit.

Assuming that conditions are favorable for growing stock—climatic and feed and other conditions—the only way for the beginner to lose is to quit. His misfortunes become a part of his capital investment if he stays with the business. The lessons taught by bitter experience are the most valuable.

Sometimes the discouraging time comes soon after the stock has been purchased, sometimes one or two years after the enterprise has been started. But that is just the time to "stick the tightest" and remember that no one ever lost money who bred good animals and fed them well—if he stayed with it.

### A HAPPY MEDIUM

One farmer, not a very good feeder at best, with short feed and high prices complains that one of his sows farrowed only three pigs, weak, sickly ones at that. And not far from him is a breeder of registered hogs who is a skilled feeder and fitter of show animals. His animals get the best of everything in the greatest of abundance. And he had a sow, a wonderful animal, which weighed over 600 pounds, and her litter consisted of three weak, flabby pigs that required the closest attention and careful nursing to save their lives.

These two sows were the victims of two extremes in hog growing. A thin, weak sow is not in condition to conceive and develop a large healthy litter; neither is her over-fat sister.

Of course there are cases where both very thin and very fat sows farrow and raise satisfactory litters, but they are not the rule. A happy medium is safest and best. Enough feed to keep the sow in thrifty, vigorous condition, plenty of exercise, and all round rational treatment are best.

Keep salt and lime and ashes and charcoal before the sows all the time and keep them increasing gradually in weight throughout the entire gestation period.

### THE "SIX" SENSES

In a primary school examination one of the questions was with regard to the five senses. One of the bright pupils handled the subject thus: The five senses are: Sneezing, sobbing, crying, yawning, coughing. By the sixth sense is meant an extra one which some folks have. This is snoring."—Woman's Home Companion.

We praise her doughnuts and her pies, her biscuits and her cake, but where's the man who sighs for pants like mother used to make? She used to take a pair of pa's, when they were worn and frayed, and decorate them with a patch of some contrasting shade, and cut them off about the knees, and take the waist in, too, and say that they, for every day, were just the thing for you.

The twentieth century version of Cromwell's motto is "Trust in God and keep your army dry."—The Independent.

# A Five Months Old Calf for \$35,000

Written for California Cultivator By Leroy Anderson

**S**OME snow! Eighteen inches of it fell in Syracuse between dark and dawn on the night of December 13, and over 20 inches by the following noon. This was on top of a ten or 12 inch snowfall of December 8, making at least 30 inches on the level.

But what has the snow to do with a cattle sale? At least two things in this instance, for snow sometimes blockades railroads. Prospective purchasers were either delayed in reaching the sale or did not arrive at all. And, further, those present had no assurance as to when cattle could safely be shipped and were thus slow in bidding. One man whom I met started from New York City Thursday evening and should have reached Syracuse next morning but did not arrive until Friday's sale was completed. However he had the pleasure Saturday of paying \$3000 for a four months old bull calf and so must have been satisfied with the trip.

It is called the Dairymen's Convention sale because it immediately followed a three day session of the New York State Dairymen's Association, the theory being that each would help the other in drawing a crowd. Notwithstanding an attractive program, the convention attendance was disappointing and its contribution to the sale was not large.

The sale pavilion is located at Liverpool, a half hour's trolley ride north from the center of Syracuse. It is a two story frame structure, the first or ground floor being almost entirely occupied by cow stanchions, while on the second floor is a large dining room, feed storage (for cows) and the selling arena. The dining room will seat 250, while the arena will seat twice as many. Both are supplied with heat by a large boiler on the ground floor, so that even in this zero weather we were exceedingly comfortable. Dinner was served by ladies representing local societies, at a cost of 50 cents per plate, on Friday to 150 men and on Saturday to 200. The total attendance at the sale would be a little more than this.

It was a pleasure to meet several men who have made and are still making Holstein history, such as John Arfmann, H. A. Moyer, Oliver Cabana Jr., R. E. Chapin and F. E. Jones, all of New York, and F. P. Knowles and F. H. Metcalf of Massachusetts. Other states represented by one or more buyers were New Jersey, Pennsylvania, Kentucky, Illinois, Indiana and Wisconsin. J. T. Williams of Sterling, Illinois, purchased the largest number, 22 head for a total of \$5200, including the yearling bull, King Toh Lyons, at \$800. They say there was one man from California but he didn't buy anything.

The really thrilling moment arrived at about three o'clock on the second day when a bull calf scarcely five months old was led into the ring beside his dam, King Pontiac Diana Pietertje. There was a hush as the breeder and owner, Oliver Cabana Jr., of Buffalo, arose to state the little fellow's breeding and the records for milk and butter production that are behind him. Then the bidding began at \$17,500 and rose by leaps of \$500 or \$1000 until it reached \$35,000 and stopped. The calf was struck off to J. T. Shanahan of Buffalo. The calf is by name, Majestic Rag Apple. His sire

is Rag Apple Korndyke 8th, the first bull to have been sold at public auction for \$25,000. He has one half brother which sold for \$20,000 and another which, at five months old, sold last June at the Worcester, Massachusetts, sale for \$53,200. His dam has a six year old record of 40 pounds of butter and 825 pounds of milk in seven days. So this little Majestic Rag Apple travels in classy society. Mr. Shanahan was a bidder on the Rag Apple calf at Worcester and was beaten by Mr. Field at the \$53,200 mark, but he landed this one at Liverpool and maybe has just as good an animal. He had the distinction of topping the bidding at Worcester on females, on the cow Vandermere Belle Hengerveld at \$18,300. He is a manufacturer who has been obliged to give up city business on account of health, but no doubt will find it again amongst his Holsteins. He is associated with C. H. and Philip Dold, also of Buffalo.

A total of 153 head was sold, ranging in price from \$40 for a calf a few days old to the high mark for Majestic

Rag Apple. The total sales amounted to \$88,145, or an average per head of \$575. Eliminating the \$35,000 calf, the average per head is \$347. The average of all animals sold at Worcester was for 143 head \$2073.

Prices at Syracuse were generally disappointing, and Holstein men do not accept them as indicating what the future has in store for the Black and Whites. That weather conditions were a contributing factor is evidenced by a remark overheard in the Yates Hotel Friday morning. The speaker had just noted the weather when he said, "Well, boys, this sale will be like picking presents off the Christmas tree for us." A second important factor is the uncertainty as to prices for milk. As one breeder expressed it, "With federal control of milk prices in the air, dairymen don't know where they stand."

The boys in the trenches were not forgotten. John Arfmann of Middletown brought a Red Cross calf into the ring with the statement that he wanted to raise \$1000 on him. He had been sold for the cause in Middletown and turned over for resale at Syracuse. The hat was passed until the total, including Middletown's contribution, had reached \$760. Then the calf was put under the hammer and struck off at \$240. John returned home happy that his Red Cross circle had realized the coveted sum.

## ACORNS FOR HOG FEED IN WAR TIME

From the Journal of the Board of Agriculture (England), issue of November, we extract the following: "The president of the Board of Agriculture and Fisheries again urges upon stock keepers the great importance of making full use of the present abundant crop of acorns. Grain of all kinds must be conserved for human consumption; other food material must be used in the feeding of stock. In general composition acorns closely resemble the cereal grains and require only the addition of green fodder and such foods as are rich in flesh-forming materials e. g., oil cakes and milling offals, to constitute a suitable diet for growing or fattening animals. Acorns are specially adapted for pig-feeding and can often be used most effectively and economically when pigs are allowed to gather them where they fall."

In view of the fact that there are in many parts of Northern and Central California large areas of the Evergreen Oak (*Quercus chrysolepis*) and the deciduous or White Oak (*Quercus lobata*) which yield many acorns it would seem that there is a great source of hog-food which should not be allowed to go to waste. — A. R. Gould.

**MILKING** a cow is not like pumping water. A milking machine is designed to work on a living animal and must therefore have qualifications different from other kinds of machinery. The first and most important requirement is to reproduce the action of nature. The sucking calf was the original milker. He sucks on the teat, then squeezes it towards his throat (downward) with his tongue and the roof of his mouth, then stops sucking momentarily while swallowing. These three actions are faithfully reproduced in the actions of the Perfection teat cup,—suction, downward squeeze, release. That is why so many careful dairymen have selected the Perfection for use on their high priced herds. You take no chances with Perfection, even on your test cows, because its action follows Nature's Way.

The Perfection teat cup fits all sizes of teats, thus doing away with the bother of changing teat cups every

time you move from one cow to the other. The soft rubber lining of the Perfection teat cup feels easy on the cow's teats, and the downward massage creates a soothing feeling which makes the cow respond by giving her milk down freely.

The Perfection can be instantly adjusted to fit the requirements of the individual cow—whether she is a hard milker, an easy milker, or has tender teats. A turn of the needle valve of the pulsator does it. That's why the Perfection is used on cows on official test without fear of injury.

S. E. VanSlyke & Son, Proprietors of Pine Park Stock Farm, Northfield, Minn., say:

"The Perfection Milkers we have been using for over 2½ years are giving complete satisfaction. Our herd consists of pure bred Holsteins any one of which is worth more money than the milker, so we would not continue to use it if it showed any bad effects upon the cows teats or udders.

We have used it as high as four times a day on cows on official test, with great success. Some of the cows on which it was so used were two year old Heifers with their first calves. We are pleased to recommend the Perfection Milker to anyone wanting the best in milkers."

G. G. Burlingame of Cazenovia, N. Y., writes:

"Your Milking Machines on my farm are giving the utmost satisfaction. They are very simple and easy to run and two men to do the milking in the same time that it used to take five. Our milk sheets show that we get fully as much milk by using the machines, as we did when we milked by hand.

These machines are in use on three other farms, with which I am connected and in each case, have done excellent work. You will be interested to know that we made some very creditable butter records last spring. One cow made nearly 32 lbs. in a week, two others made 27 lbs. as three year olds and one two year old made over 24 lbs. One cow milked 99 lbs. in a day."

Profit by the experience of others.

# PERFECTION MILKER

## Who's Who

With the issue of August 11 the Cultivator started its series of "Who's Who" articles to bring before its readers some of the livestock producers of California who are responsible for the large development of the industry. Where did they come from and how long have they been engaged in California development, also how do they look, so pencil and camera are to be used, and some homely, everyday photographs and notes regarding them will bring us closer together. Bear in mind we say "homely photographs" and not photographs of homely people. The idea we wish to convey is that so far as possible we will secure photographs in everyday surroundings at the homes of the livestock producers.

FRED W. KIESEL

Written for California Cultivator  
By F. F. Stonerod

**T** HERE is a Holstein breeder up in Sacramento County who has not been making much noise the past few months, but he is very much alive all the same, and before a great while will be very much in evidence. I refer to Fred W. Kiesel, Sacramento banker, capitalist, farmer, breeder, and all round good fellow.

The reason why the Kiesel Hol-

themselves, in his model ranch and its environment. He figures it cost him in the neighborhood of \$12,000 to complete the work. Every reactor was sent to the butcher or sold otherwise. One hundred and fifty head were tested every three months.

I mention this instance to show the originality and determination of the man. As all financiers should be, Mr. Kiesel is slow to pass judgment, but once he decides a matter, he acts.

He was born in Ogden, Utah, forty odd years ago; graduated in the '96 class at Harvard, spent five years in Europe studying the vineyard industry, and then came to Sacramento where he founded the Cordova Vineyards. His father has been a live stock man all his life, living at present in the Northwest where he owns large stock ranches in Oregon and Idaho. Mr. Kiesel started his registered herd of Holsteins three years ago with 35 head. He purchased most of them in Syracuse, New York. The herd now numbers 150 head and contains some of the highest class stock in the state, including Prince Gelsche Walker Korndyke, a bull Mr. Kiesel paid \$4000 for, and King Korndyke Pontiac.

Mr. Kiesel is interested in a number of big projects in California. He is vice president of the Natoma Gold Dredging Company at Folsom, vice president California State Life Insurance Company, is a 32 degree Mason and Knight Templar. He is also president of the State Holstein-Friesian Association.

This year he saw the possibility of a fortune in raising beans and will have about 15,000 sacks for sale at war prices, all produced on his wonderful delta ranch in Sacramento County.

As soon as he is satisfied his Holsteins are ready to do business with a clean conscience something is bound to happen in the Kiesel herd. His cows have better than an even chance to break existing state records and possibly world's records, for they certainly have the breeding, and his herd sires have the inherent ability to produce record daughters.

Fred W. Kiesel

steins have not been in the public eye is that their owner quarantined his ranch about a year ago and decided he would have a herd absolutely clean of those diseases so common to dairy cattle or quit the business. The absolutely "clean" herds of dairy cattle in the United States are few and far between. We put the word clean in quotation marks so that it will not be misinterpreted. In this case it means clean from diseases such as tuberculosis and abortion. The stringent state law on tuberculosis was not the only reason why Mr. Kiesel decided to take this costly step—he had a just pride in the ownership of the animals

## Field Notes from the Live Stock Men

This Week's Live Wireless Notes With Special Regard to Holstein Activities in the State.

Nadgy Korndyke Mooie 3d, one of the pair of prize winning daughters of King Mead of Riverside so much admired by visitors at the last state fair, recently freshened as a junior two year old and made an official record of 21.04 pounds butter in seven days in the herd of J. H. Harlan Company.

Prince Alcartra Korndyke, senior herd sire in the herd of registered Holsteins owned by The J. S. Gibson Company, Williams, is coming to the front in great fashion as his first daughters complete their records. Five of them, all two year olds with first calf, have now completed yearly records averaging 15,333 pounds milk and 675.82 pounds butter. They averaged 17.08 pounds butter and 387.5

pounds milk in seven days at the beginning of their lactation periods. Princess Roma Alcartra, another daughter that dropped her first calf as a three year old, made 22.55 pounds butter and 499.9 pounds milk in seven days, while Princess Hazel Alcartra, who made the lowest record of the five with first calf, has made the splendid record of 25.10 pounds butter and 555 pounds milk in seven days at her second freshening as a three year old. Prince Alcartra Korndyke is the oldest son of the world's greatest long distance producer, Tilly Alcartra, and is sired by Korndyke Queen De Kol's Prince, whose daughters are noted for high and persistent production and unusual size and individuality.

King of the Black and Whites, the

### King Korndyke Pontiac

Shown above is our senior herd sire, and he is a son of the peerless sire, King of the Pontiacs, 228 A. R. O. daughters, two above 40 pounds butter in seven days, and he has 32 two year old daughters with yearly records averaging 769.01 pounds butter, one of them with 1023.41 pounds, his first four year old daughter tested for a year made 1043.27 pounds butter, and his first daughter tested at mature age made 1066.42 pounds butter in one year.

### King Korndyke Pontiac 20th

Shown below, sold in the Guaranty Sale to one of the most progressive breeders in California, Mr. W. J. Higdon of Tulare, Cal., for \$6500.00, the highest price ever paid for a calf on the Pacific Coast, and everyone agrees that Mr. Higdon secured a real bargain in high production backing both short and long time records, and outstanding individuality.

This wonderful young bull is a son of KING KORNDYKE PONTIAC, and we have a few of his brothers on hand to offer. Decide now to ask us for prices and pedigrees and select one to head your herd and be in line with the blood that is going to make production history in the future as it has in the past.

**Superior** **State** **Tested** **Production** **Butter Fat** **Everything** **Guaranteed** **Individuality** **Breeding**

## King Korndyke Pontiac 20th

In our junior herd sire we required high individuality backed by consistent high production of milk and butter both for short and long time periods. And KING KORNDYKE PONTIAC 20TH meets our requirements in every respect.

We appreciate his inheritance more fully when we go over the performance records of every single animal in his pedigree for several generations back and find not an unworthy one in the lot. And after we are satisfied with the study of their great records and proven ability to transmit great production we find added satisfaction and security in a study of the wonderful individuality of these ancestors, splendid bulls whose

outstanding type has been repeatedly proven in the show ring, and the great deep bodied females with not a poor udder among the seven nearest dams.

His sire: KING KORNDYKE PONTIAC, acknowledged one of the best individual sons of the great King of the Pontiacs, whose 228 A. R. O. daughters include two with records above 40 pounds butter in seven days, 17 others with records above 30 pounds butter in seven days, and his entire list of two year old daughters tested for one year, 33 in number, average 762.42 pounds butter. King Korndyke Pontiac already has several A. R. O. daughters with good records and is now in active service at the head of Mr. Fred W. Kiesel's great Jane Garden Farm herd at Sacramento.

His dam: MISS VALLEY MEAD DE KOL WALKER, 36.81 pounds butter in seven days as a junior three year old, 790.38 pounds butter in 257 days as a senior two year old, 21.33 pounds butter in seven days eight months after calving as a senior two year old, the world's record in class. She is the highest record daughter of Prince Gelsche Walker, one of the greatest young sires of the breed, and out of De Kol of Valley Mead 2nd, 1011.71 pounds butter in one year as a four year old whose dam is a famous granddaughter of De Kol 2nd, the fountainhead of the De Kol family. This heifer is only fairly started on her high production accomplishments.

Ten of the fourteen nearest ancestors of KING KORNDYKE PONTIAC 20TH are living and in high class herds where they and their offspring are being fully developed, and in this herd he will be bred to a large number of high record females and the young daughters of

## Prince Riverside Walker

our senior herd sire, about whom you will hear much later on.

Come and visit KING KORNDYKE PONTIAC 20TH at home, see the quality of the cows with which he will be mated, and you will surely find something that will fit in with your breeding plans.

W. J. HIGDON, Tulare, California

## Hauser's Digester Tankage

GIVES GREATEST VALUE FOR LEAST MONEY  
IT MAKES THEM FAT.

Hauser Packing Co.

Los Angeles

famous proven sire recently secured by Henderson Company, Sacramento, to head their big herd of registered Holsteins, now has 30 A. R. O. daughters, and as many of his daughters now in some of the best Eastern herds are due to drop their first calves during the present season he will no doubt have a much larger list by spring. He is being bred to a large number of great cows and heifers in the Henderson herd where his first calves are due in the spring. The manner in which he is fulfilling the promise of his rich breeding, coupled with his close relationship with Prince Gelsche Walker whose offspring are making sensational records, assures this family a place of the greatest prominence in current Holstein history.

Luther Thompson, Modesto, recently purchased from Bridgford Company a handsome and splendidly bred young bull to head his herd of registered Holsteins. The dam is the beautiful heifer Chimacum Maud, that recently completed official records in the Bridgford herd of 624 pounds milk and 29.81 pounds butter in seven days at the age of three years, five months. She is not only a great individual and producer but is also of unusual size, weighing at the present time 1900 pounds. The sire of Mr. Thompson's new herd sire is Sir Chimacum Wayne, son of the great Chimacum Wayne Boon, 613.8 pounds milk and 33.69 pounds butter in seven days at 4½ years, 23,576.40 pounds milk and 1067.47 pounds butter in one year at six years, and from last report she had 561.92 pounds butter and 11,980.5 pounds milk to her credit in the first 148 days of the test she is now on. She is the highest yearly record daughter of the great sire Sir Veeman Hengerveld, and is the dam of Chimacum Wayne Boon 2nd the great heifer that made 21,572.6 pounds milk and 882.60 pounds butter in one year as a two year old. The sire of Sir Chimacum Wayne is a son of the great producer Margie Newman, 868.2 pounds milk and 32.79 pounds butter in seven days, 3555.6 pounds milk, 131.19 pounds butter in 30 days, and she is the dam of Margie Newman 2nd, 720.1 pounds milk and 31.13 pounds butter in seven days. It will thus be noted that Mr. Thompson's new sire is backed by tremendous records of both milk and butter, which is better emphasized by the facts that four of his first dams average 656 pounds milk and over 30 pounds butter in seven days, and two granddams average 24,036 pounds milk and 1011 pounds butter in one year.

Bridgford Company, Knightsen, recently purchased from Gotshall & Magruder, Ripon, the heifer calf from Spring Farm Cornucopia Ormsby, the \$1650 heifer. She is sired by the Bridgford senior herd sire, King Segis Alcartra Abbecker, and her first 11 dams have the splendid average of 30.81 pounds butter in seven days including the two year old record of her dam.

Bonita Stock Farm is getting under way with official testing of their reg-

istered Holsteins, and some creditable records have been made regardless of the fact that this is not long since the cows and heifers comprising the herd reached California from the East. About 20 cows and heifers have completed seven day records so far with records up to over 22 pounds butter, including a number of 16 to 18 pound two year olds. The herd is headed by the 32 pound sire, Supreme Glista Pietje.

Senator J. M. Hackney of Minnesota, owner of Arden Farms, announces that every daughter of his sensational Holstein bull, King Segis Pontiac Count, will be given a yearly record. The greatest breeders in the country are rapidly recognizing the fact that the yearly record is the only stable foundation upon which to construct a high class herd of registered dairy cattle for future demand, and are laying their plans accordingly.

The value of a pure bred registered dairy sire is nowhere better proven than when the dairymen gets ready to sell his herd at public auction. It is nearly always noticeable in such an auction sale that daughters of the pure bred bull will bring from \$15 to \$30 a head more than the daughters of a scrub bull, and the cows fetch more money when they are in calf to a registered bull. And there are still dairymen using scrub bulls and apparently expect to breed the kind of cattle that other dairymen want to buy. What a difference an investment of \$200 or \$300 in a good registered bull would make on the day the herd is sold!

While testifying before the commission investigating the price of milk in San Francisco recently, Frank Somers & Company, hay and grain dealers, stated that in his opinion no hay is being held in storage by dealers and that he would not be surprised before the winter is over to see alfalfa hay sell between \$35 and \$40 per ton. The writer has recently been through some sections of California where hay can usually be bought at this season of the year, and there is none for sale. The farmers themselves seem to be the fellows who have the hay this year, and they are not storing it for speculative purposes. There seems to be just about enough on hand to carry these live stock owners through the winter and keep them out of the clutches of the usual hay speculators.

To those who look far into the future California's present development as a producer of dairy products is only a starter toward the commanding place the state will one day hold in the dairy world. Development along dairy lines promises to be exceedingly rapid during the next few years, for widening markets are opening up, the establishment of condensers has fairly begun, cheese factories are multiplying, and, best of all, California dairymen have at last begun to think Organization, cow test work, the use of pure bred registered sires, the silo, are four mighty important dairy factors that are receiving a lot of attention these days all up and down the state.

One hundred silos were built in Tulare County during 1917, and at a conservative estimate 250 silos were built in Stanislaus County during the same year. Three hundred and fifty silos in one year in just two counties of a state that probably did not have within its entire boundaries over 50 silos five years ago! The silo and prosperity have gone hand in hand in other live stock producing states, and

## Get on the Band Wagon With Other Progressive Breeders

by heading your herd with a real bull as indicated by the yearly records of his ancestors.

### Why Take a Chance on the Abnormality of Short Records?

Never before has there been such demand for yearly record sires. The leading breeders of America are turning to yearly record bulls regardless of short records.

We can offer now an outstanding youngster backed by both yearly and short time tests. From a yearly record standpoint he compares favorably with the best of the breed.

His Sire: **SIR AAGGIE DE KOL ACME** (whose dam and sire's dam average 1236.98 pounds butter in one year), son of Aaggie Acme of Riverside 2nd, 1331.64 pounds butter in one year, strictly official, 2426.76 pounds in two years. Both world's records.

His Dam: **MISS DUTCH 2ND**, now in test and promises to exceed 850 pounds butter in one year as a four year old. Her dam has 1025.97 pounds and her dam 1008.27 pounds.

In seven day test dam's record 26.78 pounds butter as a four year old, her dam 30.05 pounds, next dam 27.60 pounds. His sire's dam 35.38 pounds.

This bull's three nearest dams average for one year 1065.78 pounds butter, for seven days 30.74 pounds. Six of his first seven dams average for one year 1026.17 pounds, for seven days 29.72 pounds.

His dam is a daughter of **KORNDYKE QUEEN DE KOL'S PRINCE**, one of the breed's greatest sires. She will surely increase her present records.

This richly bred young fellow was born April 30, 1917. He is beautifully marked and his type would be hard to fault. The price is lower than the same quality can be had for anywhere else in the United States.

## King of the Black and Whites 83354 The Greatest Producing Sire in California

Now has 30 A. R. O. daughters, a greater number than any other sire in California, and more coming right along.

He was the first bull in the world whose seven nearest dams averaged over 30 pounds butter in seven days, and this is only one instance of the remarkable uniformity of the great production records in his pedigree both for milk and butter.

He is transmitting his wonderful inheritance of large milk and butter production because there are no weak spots in his breeding for generations back, no throwing back to a low producing ancestor, and by every law of animal breeding his daughters, as they are already proving, will be uniformly great producers and his sons will hand down his good quality to their offspring.

### King of the Black and Whites

is being given a full opportunity in our herd where he is being mated with a large number of high record cows and highly bred heifers. We have none of his offspring to offer at present, but if you want to keep your herd in line with the march of production records it will interest you to visit our herd and get acquainted with these matings.

We have a limited number of grandsons of King of the Black and Whites and King of the Pontiacs for sale at moderate prices and terms.

## An Important Message To Every Cow Owner

There was never a time in the history of the world when the saving of every ounce of butter-fat and every particle of effort and time was so important as now.

There was never a time when the use of a late improved De Laval Cream Separator meant so much to every cow owner.

This is true whether you are using no separator, some inferior separator, or even an old style De Laval machine.

Fortunately it happens to be not only a matter of patriotic duty but at the same time one of dollars-and-cents advantage as well.

A New Type De Laval Cream Separator skims cleaner and produces a better quality of cream than any other separator or skimming method.

Likewise, by reason of its easier turning, easier cleaning, greater capacity, simplicity and durability, it saves time and labor over any other machine or method.

Moreover, the use of a De Laval Cream Separator is better than any other way of utilizing milk because it keeps the valuable skim-milk on the farm.

Nor should the installation of an improved De Laval machine be delayed a single day. It begins saving the first day it is put in, and will likely have paid for itself by spring.

We guarantee all this to be true—but the better way is to demonstrate it in your own dairy to your own satisfaction.

That every De Laval agent is glad of the opportunity to do—without any obligation on your part unless satisfied that every claim made is fulfilled.

There are local De Laval agents almost everywhere. If you don't know the nearest one simply address either of the main De Laval offices as below.

Registered Bulls—yearlings and two year olds. Bred on same lines as our Grand Champion cow at Sacramento, 1917.

Bears and Gilts by Iowana Rival Majestic, a son of Rival's Champion.

Prices Reasonable on Application

San Francisco Office

226 Southern Pacific Bldg

Better service is assured by the advertiser if when writing you mention the California Cultivator.

the same condition is bound to prevail in California.

Sir Pietertje Ormsby Mercedes, the great Holstein bull formerly at the head of the E. C. Schroeder herd in Minnesota, is dead. He has left behind him a wonderful lot of sons and daughters, the latter being noted for show ring winnings, short time records, and more especially their yearly records, four of them having produced from over 1100 to 1389.45 pounds butter in one year. As far as we know only one of his sons is in service in California, that one being a splendid type one now at the head of the herd of registered Holsteins owned by The McCloud River Lumber Company, McCloud.

Jessie Fobes Bessie Homestead, the great Holstein cow that topped the females of the Detroit Guarantee Sale at \$4600, died recently following an attack of milk fever. She was the first cow to make over 33 pounds butter in seven days in three successive lactation periods, and was rated as one of the breed's greatest cows. Since the Detroit sale she has dropped two living calves, both bulls and both by high record sires. W. J. Higdon of Tulare purchased a number of females in calf to one of her sons about a year ago and now has several granddaughters of this great cow.

Every Holstein Breeder needs the Blue Book in order to keep posted on the official records made by cows of the breed. Volume 28, just out, contains over 1400 pages of plain facts about Holstein records, well classified for handy reference. The price of the volume is only \$2.25 postpaid and may be secured from Superintendent of Advanced Registry, Malcolm H. Gardner, Delavan, Wisconsin.

California Breeders' Sales and Pedigree Company has received interested inquiries for catalogs of its sales from both China and Japan during the past few months. Prominent Japanese have already made a number of purchases of registered Holsteins.

E. Susaeda, who recently purchased a splendid lot of registered Holsteins for the interests he represents in Chile, stated that the common cow in Chile averages about five pounds of milk per day, being milked only once. There are one or two herds of grade Holsteins that average about 20 pounds of milk per day, milked once a day. Mr. Susaeda is taking back to Chile with him a number of California silos and a fund of feeding knowledge gained during his course at University Farm, Davis, it will be interesting to note what will happen in his section of Chile when his registered Holsteins begin to freshen.

Alex Whaley, Tulare, who is rapidly progressing as one of the leading California Holstein breeders, recently made a very fortunate purchase of a junior herd sire from A. W. Morris & Sons Corporation, Woodland. This young fellow is Sir Aaggie De Kol Acme 2nd, and is sired by Sir Aaggie De Kol Acme, owned jointly by the Morris and Fred W. Kiesel of Sacramento, he being a son of the world's official record butter cow, Aaggie Acme of Riverside 2nd, 1331.41 pounds butter in one year. The dam of this young fellow is one of the greatest cows in the Morris herd, Aralia De Kol 3d, who recently completed a yearly record of 1101 pounds butter. She is a daughter of the former world's record cow, Aralia De Kol. Some idea of the tremendous yearly butter records behind Mr.

Whaley's new sire is indicated by the fact that the three nearest dams average 1191.57 pounds butter in one year, and five of the seven nearest dams average 1105.17 pounds butter in one year, making him one of the best backed yearly record bulls of the breed.

J. H. Hulbert Jr., Mt. Vernon, Washington, recently selected a wonderfully well bred young bull from the herd of A. W. Morris & Sons Corporation, Woodland, to take up the duties of junior herd sire in his famous herd. The bull Mr. Hulbert selected is Segis Pontiac Mead, sired by Segis Pontiac De Kol Burke, son of the former world's record cow, Riverside Sadie De Kol Burke. The dam of Mr. Hulbert's new sire is Aralia De Kol Mead, by King Mead of Riverside and out of Aralia De Kol. As a two year old she made 870.61 pounds butter in one year and is now well along on a yearly test that promises to exceed 1150 pounds butter. Thus Mr. Hulbert's bull is full brother to Aralia De Kol Pontiac Mead who recently finished her year with 934.25 pounds butter as a senior two year old, the California record in class by a wide margin. Mr. Hulbert's senior herd sire is Segis Pontiac Acme, also a Morris bred bull, whose get provided the sensation on the Northwestern show circuit last fall, and in selecting a sire to mate with the daughters of this bull, Segis Pontiac Mead seems a happy selection both for breeding and individuality, and strongly fortifies the yearly record blood already present in the Hulbert herd.

Two noteworthy records were recently made by a pair of twin heifers in the A. W. Morris & Sons Corporation herd of registered Holsteins. Both freshened as junior two year olds, Aralia De Kol Mead 2nd making 21.60 pounds butter in seven days and her twin sister, Aralia De Kol Mead, making 15 pounds butter in seven days. The noteworthy feature is the excellence of the record of the first named heifer who milked as high as 73 pounds in one day, and the fact that the last named heifer freshened with two blind quarters and still made 15 pounds butter in seven days and milked as high as 53 pounds in one day out of half an udder, making a record for both milk and butter that would not be at all discreditable to a good junior two year old with a whole udder. These heifers are sired by Segis De Kol Burke, and as their names indicate are out of Aralia De Kol Mead, and are thus full sisters to Aralia De Kol Pontiac Mead, 934.25 pounds butter in one year as a senior two year old.

Meadow Holland Nudine, grand champion Holstein cow at Riverside District Fair, and sold by Stalder Bros., Riverside, in the Guaranty Sale to Fred W. Kiesel, Sacramento, is fulfilling expectations. She freshened the day before she was shipped from Riverside to Sacramento, went through the discomforts and excitement of sales quarters, and was then shipped to her new home, Mr. Kiesel's Jane Garden Farm. She was then placed on official test and has completed record of 25.10 pounds butter in seven days as a junior four year old. Besides being such a splendid individual she is regarded as a candidate for a much larger record under favorable conditions and looks like a most promising member of Jane Garden Farm herd.

Only two cows in California so far have produced two daughters that have made records above 30 pounds butter in seven days. The first of

these was Mabel Haskins of San Jose, Kenneth Abbott's famous cow, and the other is Winifred Hotaling, one of the cows formerly in Richard M. Hotaling's Sleepy Hollow herd. One of her daughters, Winifred Hotaling 3d, made 32.19 pounds butter in seven days after Alex Whaley had consigned her to the Guaranty Sale, where she was purchased by W. P. Higdon of Tulare.

The rapidly growing demand for yearly records of milk and butter behind the herd bulls bought by the most progressive dairymen is reflected in the increased demand for sires backed by yearly records, among owners of registered herds. A most satisfactory number of developing herds are being headed by splendid yearly record bulls, and as the supply of this class of bulls is very limited there are not enough on hand in the country to meet present demands. Which shows that the dairyman has been doing some figuring and has found that the additional security offered by a yearly record is well worth his investment.

Gotshall & Margruder, Ripon, two live wire business men and bankers, started to breed registered Holsteins only a few years ago and in securing their foundation animals they were liberal buyers at several public sales. They became known as prominent bidders when the top animals came up, and how well their selections were made partially revealed at the Guaranty Sale. In a Southern California sale they purchased one of the highest priced heifers of the sale, the now famous state record two year old K. P. Tola Joe. At the Guaranty Sale they sold her six months old heifer calf, Lady Sadie Vale Joe Karlay, to John W. Benoit, Modesto, for \$1400, and she was one of the most eagerly bid for animals in the whole sale. Sometimes the beginning breeder hesitates about going after the top animals, even though any experienced breeder will tell him that it is good business, but it pays to do it.

Fred W. Kiesel is another Holstein breeder who went out after the good ones for foundation and paid the price that good ones demand. In the 1915 Morris-Alister sale he bought Jane Korndyke of Riverside, the 31 pound cow that topped the sale. In the Guaranty Sale he sold her yearling daughter for \$1300 after a spirited bidding contest.

James McGillivray, owner of Willowmead herd of registered Holsteins, has moved the herd back to Sacramento from Galt where it was taken following Mr. McGillivray's purchase of a 1200 acre ranch there. A very large number of the females in the herd are being bred to Dutchland Sir Korndyke Colantha, whose first daughters to freshen made such excellent records, half of those tested making over 20 pounds butter in seven days as junior two year olds.

H. E. Vogel, Fresno, recently selected a high class young bull from the herd of A. W. Morris & Sons Corporation. This youngster is sired by King Mead of Riverside, sire of the world's official yearly record butter cow Aaggie Acme of Riverside 2nd, and is out of Margaret Aralia De Kol, a 26.91 pound four year old granddaughter of Aralia De Kol. She made 723.02 pounds butter in one year as a senior two year old and is now well along on a year's work that promises to finish well above 1000 pounds butter. This young fellow should prove a noteworthy addition to the Vogel herd where sires backed by yearly records

have been used for a number of years. The herd is already noted for its many fine individuals and when official testing begins there promises to be something of more than usual interest to report.

Agee Brothers of Imperial County recently disposed of their good herd of grade Holsteins to replace them with purebreds. They already have a number of registered Holstein females and recently secured a highly bred bull to head their herd from Toyon Farm Association, San Jose. This young fellow is Toyon Fayne Valdessa, a bull that was selected for the Guaranty Sale provided the pending deal with Agee Brothers was not closed. They bought the bull previous to sale date and he did not appear in the sale. He is sired by King Valdessa, the famous young son of the great 41 pound cow, Valdessa Scott 2nd, and is out of FINDERNE Miriam Fayne, a 30.54 pound four year old daughter of King Hengerveld Aaggie Fayne, two of whose daughters hold the world's yearly butter records in the junior two year old and junior three year old classes, and whose sire is also the sire of the only 50 pound cow, Segis Fayne Johanna.

The Holstein Breeders' Guaranty Sale held at Sacramento on December 5 established several new sales records. It was the biggest one day Holstein sale ever held anywhere; the average of \$957 per head was the highest ever made in a Holstein sale where the top animal sold for less than \$20,000; and the lowest price for an animal in the sale, \$330 for a young calf, was the highest price ever paid for the lowest priced animal in a Holstein sale. All of which goes to show that the committee of selection did its work well and found appreciative buyers on sale day. A prominent out of the state breeder remarked at the close of the sale that it was the best lot of cattle and the best managed sale he had ever seen and that the California Holstein breeders are as fine a body of men as he has ever met.

Recent Holstein sales have justified in a most striking manner the good judgment of breeding and individuals displayed by Superintendent W. H. Taylor when he selected the foundation animals for Anita M. Baldwin's Santa Anita Rancho. In two recent sales Santa Anita Rancho sold only calves, offspring of the original foundation cows and heifers, yet in one sale the Santa Anita consignment brought the second highest average, and in the Guaranty Sale topped the average of the sale when eight calves sold for an average of \$1388, including the great bull, King Korndyke Pontiac 20th that fetched the Coast record price of \$6500.

Holstein Breeders, like all other business men who are speculating on just what effect the war is going to have on their business, may find a guiding line in the experience of breeders in England, a nation that has now been at war for over three years. During the past year over 1000 head of registered Holsteins were sold at public auction in England for an average of over \$500 per head. Which indicates that when food is scarce and prices are high the pure bred Holstein cow becomes better than ever appreciated. In this connection it is also worthy of note that England's record sale of registered Holsteins was held quite some time after the war was under way, an average of over \$1200 per head having been secured on that occasion.

## Jerseys for Net Profits

You're in the dairy business for profit—the net profit that your herd has made you at the end of the year will determine the size of your bank account. Jerseys yield the largest returns from every ounce of feed—proved by tests at two great expositions. Jersey milk averages 5.3% butter fat, 9.1% solids not fat—highest of all breeds. Buy a Jersey bull.

Write the breeders advertised below for prices, pedigrees, etc.

SECRETARY Stollery of the California Cattlemen's Association sends us a copy of a letter which General Manager Beard of the Sacramento

Valley Development Association has sent out regarding the advisability in the present feed shortage of extensive feeding of rice straw. From Mr. Beard's letter we quote: "I desire to say something to you and through you to the cattlemen of the state about rice straw. Rice straw is successfully fed to horses and cattle, especially where complementary feeds are available.

"Rice straw is abundant in the Sacramento Valley. The rice fields of this

### Feed Rice Straw

valley produced this year approximately 100,000 tons of rice straw. Some of this has been baled and shipped out; much of it remains in the rice fields, probably not less than one-half of the total, or 50,000 tons, and is due to be burned unless the stockmen of the state, who may need it for wintering stock, act without delay.

"In view of the extended dry season and lack of forage, it seems to us the existence of a great supply of good rice straw would be of very large interest to stockmen. I am writing you about it as president of the state association and trust you will take steps to advise cattlemen throughout the state."

### November State Dairy Cow Competition

FROM the announcement by the University of California of the results of the state dairy cow competition for November we give records of highest producing cow from each herd; also complete 12 months record. The top-notchers for November are:

Alba Sadie Cornucopia Cretia, Holstein, seven years, four months old, 273 days in milk, 1267.8 pounds milk, 3.78 per cent fat, 47,923 pounds butterfat, owned by Anita M. Baldwin.

Irene, six years old, 153 days in milk, 987 pounds milk, 5.20 per cent fat, 51,324 pounds butterfat, owned by F. Beebe.

Leda De Kol Ormsby, Holstein, four years, nine months old, 188 days in milk, 1504.1 pounds milk, 3.28 per cent fat, 49,334 pounds butterfat, owned by A. M. Bibens.

Tillie, Grade Holstein, seven years

old, 163 days in milk, 1069.2 pounds milk, 3.84 per cent fat, 41,057 pounds butterfat, owned by Bohnett Bros.

Pansy, Grade Jersey, 211 days in milk, 799.8 pounds milk, 5.7 per cent fat, 45,589 pounds butterfat, owned by J. M. Bomberger.

Little Surprise, Grade Jersey, five years, 188 days in milk, 810.0 pounds milk, 6.76 per cent fat, 54,756 pounds butterfat, owned by J. W. Coppini.

Golden Idelia of Belle Vista, Guernsey, three years and four months, 158 days in milk, 742.2 pounds milk, 5.41 per cent fat, 40,153 pounds butterfat, owned by Dr. J. W. Henderson.

No. 458, Grade Guernsey, five years, two months, 218 days in milk, 714.7 pounds milk, 6.60 per cent fat, 47,170 pounds butterfat, owned by Hollow-Hill Farm.

Roan Cow, Grade Guernsey, seven years, 225 days in milk, 1101.0 pounds

### A Good Year

1917 has been a good year for the Butte City Ranch registered live stock business and we take this opportunity of thanking our friends for their patronage and good wishes.

We have sold a large number of Berkshires, Shorthorns and Ponies — and have the best lot on hand we have ever offered.

During 1918 it is our hope that we may hear from all Cultivator readers who are in the market for Shropshires, Shorthorns, Berkshires or Ponies.

## Miss Valley Mead De Kol Walker Breaks Another World's Record

One more accomplishment in the sensational production records of Miss Valley Mead De Kol Walker, highest record daughter of Prince Gelsche Walker, has been achieved, and another world's record brought home to her owners, A. W. Morris & Sons Corporation, Woodland.

In view of the great accomplishments of this heifer it seems not out

which still stands as the world's record in class. She had been bred early in her lactation period and at the end of 257 days was taken off test having to her credit for that period 17,010.90 pounds milk and 790.38 pounds butter. She calved again as a junior three year old within a few weeks after she had been taken off test, and made the sensational records of 36.81

Miss Valley Mead De Kol Walker

of place at this time to review her young but brilliant history. She is sired by Prince Gelsche Walker, whose daughters have been the sensation in production records on the Coast during the past year and is out of that grand cow, De Kol of Valley Mead 2nd, who made 906.28 pounds butter in one year as a senior three year old and 1011.71 pounds butter in one year as a senior four year old, the world's record for two years butter production under full age at time of making. She also made 17.18 pounds butter in seven days eight months after calving as a senior three year old, world's record when made.

Miss Valley Mead De Kol Walker freshened for the first time as a senior two year old and made official records of 534 pounds milk and 25.68 pounds butter in seven days, California record when made. She was continued on yearly test and on official test for seven days eight months after calving she made 21.33 pounds butter

pounds butter and 688.60 pounds milk in seven days. She was again continued on yearly test and is going at better than an 1100 pound butter gait.

She was again put on official test for an eight months after calving record, and on Sunday, December 30, she had made 23.86 pounds butter in seven days, thus taking her place as the world's record holder in this division of the junior three year old class, and displacing the former champion Finderne Holingen Fayne. She is still on test and gaining.

She was bred early in this lactation period also, so early in fact that she will again calve within 12 months of her last freshening, and her wonderful ability to smash world's records carrying a calf practically throughout her tests stamps her as one of the very great heifers of the breed.

She is the dam of King Korndyke Pontiac 20th, the great young bull which W. J. Higdon secured for \$6500 in the recent Guaranty Sale, which is regarded as about the most proven great transmitting blood that a breeder ever bought for \$6500.

## Bridgford Company Holsteins Open Test Season With Big Records

The season's official test work has just fairly opened in the herd of registered Holsteins owned by Bridgford Company, Knightsen, and a number of unusually good records have already been completed. This herd, comparatively recently established, has already taken front rank as a show herd, and possibly only a few breeders realize the splendid breeding that is linked up with the many great individuals in the herd. The official test is now bringing this breeding into prominence and promises to establish the herd as an outstanding combination of type and production.

The following records have recently been completed in the Bridgford herd: Finderne Ethel Pontiac, a daughter of Gordon Glen Pontiac, at four years, one month, with second calf, 538 pounds milk and 27 pounds butter in seven days.

Panje Hengerveld De Kol, a granddaughter of Hengerveld De Kol, at six years, 533 pounds milk and 28.54 pounds butter in seven days.

Chimacum Maud, a granddaughter of Homestead Girl De Kol Sarcastic Lad, at three years, five months, 624 pounds milk and 29.81 pounds butter in seven days.

Empress Korndyke Pontiac, a daughter of Spring Farm King Pontiac, at two years, two months, 419 pounds milk and 23.02 pounds butter in seven days.

King Segis Pontiac Lyons, a daughter of King Segis Pontiac, 394 pounds milk and 18.35 pounds butter in seven days.

Farm center meetings of Glenn County next week are: Codora, January 8, Larkin, 11.

## FINDERNE SOLDENE VALDESSA

In placing Finderne Soldene Valdesa at the head of our herd of carefully selected registered Holstein breeding females we believe we have secured a very desirable combination of individuality and production.

HIS SIRE is King Valdesa, who is by a son of the highest record daughter of the mighty King of the Pontiacs, and is out of Valdesa Scott 2nd, 41 3/8 pounds butter in seven days, 164.29 pounds butter in 30 days, both world's records when made, and her wonderful transmitting power is shown by her five A. R. O. daughters with records up to over 38 pounds butter in seven days.

HIS DAM is the world's record heifer Finderne Soldene Hengerveld, 35.34 pounds butter in seven days, 136.82 pounds butter in 30 days at first calving as a three year old, and she is a daughter of the wonderful sire King Hengerveld Aaggie Fayne who has three junior three year old daughters with records from 31.94 to 37.33 pounds butter in seven days, and four senior three year old daughters with records from 35.33 to 37.13 pounds butter in seven days. One of his daughters holds the world's record in the junior two year old class for yearly production with a record of 1200.64 pounds butter, another holds the world's record in the junior three year old class with a production of 1295.06 pounds butter in one year, and a third daughter made 1075.29 pounds butter in one year as a junior three year old.

FINDERNE SOLDENE VALDESSA ranks high as an individual, and his first crop of calves in our herd, a large percentage of which have been heifers to date, are straight, vigorous youngsters, nicely marked, and we consider them unusually good.

We invite you to visit our herd, and it will be well worth your while to consider a son of FINDERNE SOLDENE VALDESSA for YOUR herd sire. We have a very few youngsters to offer at present, out of good A. R. O. dams.

## Toyon Farm Association

Office:  
First National Bank Bldg.  
San Jose, Cal.

Los Altos, Cal.

COUNCILOR—First prize junior yearling and reserve champion Duroc-Jersey boar at California State Fair, 1917.

## Prize Winners

### Duroc-Jerseys and Hampshires

Our Duroc-Jersey herd is headed by the sensational yearling Councilor, sired by Critic D, which was Reserve Champion at California State Fair.

The most popular strain of pure bred breeding stock for sale at all times.

### CONEJO RANCH

Address: Newbury Park, Ventura County, California Ranch located on Ventura State Highway, 40 miles northwest of Los Angeles.

Los Angeles Office, care  
JANSS INVESTMENT  
COMPANY,  
Fourth Floor Metropolitan  
Building, Fifth and Broadway

Our exhibit won 43 ribbons at the California State Fair, 1917, majority of which were Champions and Firsts.

Our Hampshire herd is headed by Grand Champion Boar Dukes Allen.

## Think!

And you will decide that your next herd sire MUST be backed by great YEARLY record of milk and butter. And when you look for a bull with such records behind him, find what we have to offer in young sons of

### PRINCE ALCARTRA KORNDYKE

our senior herd sire, whose dam is Tilly Alcartra, the world's greatest long distance producer, the only cow of any breed to average over

30,000 pounds milk for two years, over 29,000 pounds milk for three years, over 27,000 pounds milk for four years, and over 24,000 pounds milk for five years, the latter being her first five lactation periods. She has twice made over 1190 pounds butter in one year, and one other year made over 1000 pounds.

The first five daughters of PRINCE ALCARTRA KORNDYKE to finish yearly records as two year olds averaged 15,333 pounds milk and 675.92 pounds butter in one year, a showing equalled by only a very few bulls of the breed.

You need this persistent blood in your herd, and you can secure it by buying one of our moderately priced young sons of PRINCE ALCARTRA KORNDYKE.

## "Hooverize" Your Poultry

War rations for poultry must include the coarser, cheaper grains and by-products. It is economy to use them *if your birds are able to fully digest them* and convert them into eggs and meat. And they can if you regularly add to the ration

### Pratts Poultry Regulator

America's Original Poultry Tonic and Conditioner

Pratts Poultry Regulator is not a food, but a scientifically compounded mixture of roots, herbs, spices, mineral substances, etc. Each ingredient performs a certain work in keeping the fowls in perfect health and highest vigor.

Its regular use cuts feed bills by preventing waste due to sluggish digestion, by enabling the fowls to thrive upon the coarser feeds. *And it makes hens lay.* It creates a keen appetite, improves digestion and circulation, regulates the bowels, makes the egg-producing organs "do their bit." We have backed these statements for 50 years with a broad money-back guarantee!

Pratts Poultry Regulator insures such vigorous health that the birds are practically immune from ordinary poultry diseases. For this reason alone it is worth its small cost—about 1c a month per bird. If ROUP—a germ disease—attacks your flock, Pratts Roup Remedy will quickly overcome this trouble. Use it in changeable weather as a preventive of roup and colds. It's guaranteed!

Our dealer in your town has instructions to supply you with Pratts Preparations under our square-deal guarantee—"Your money back if YOU are not satisfied"—the guarantee that has stood for nearly 50 years.

## Why Is a Poultry Show?

Written for California Cultivator By Jean A. Koethen

N ALMOST phenomenal rise of the poultry industry in 25 years, from the desultory keeping of hens on the farm by people who liked to have hens around and didn't care whether they were profitable or not, to a billion-dollar commercial enterprise has been due mainly to two factors, the incubator and the poultry show. Without the incubator the hatching of chicks in large numbers and at all seasons could never have been accomplished. Without the poultry show there would have been no improvement in type, no raising of the standard toward which all breeders are groping their way.

We are accustomed to remark carelessly that the fancy has been hard hit by the war, harder hit than utility, for eggs and meat are necessities; fine feathers a luxury that can easily be dispensed with. This is half true, for eggs and meat are certainly necessary, but it is only half true, for fine feathers, or at least the thing for which they stand, are also necessary. If the fancy has been harder hit by the war than commercial egg production—and I doubt if this is the case—it is because war is the great eliminator. In all phases of life we are being forced to eliminate temporarily the things that are not absolutely essential. We leave the sugar off our mush, the butter off our bread, not because sugar and butter are unimportant in the diet, but because greater considerations than personal taste bid us economize. In the same fashion the eyes of the poultry world are being turned on the problems of producing eggs and meat, not because feathers are unimportant, but because they seem for the moment less important than something else.

I said "for the moment," for after all there is no quarrel between fancy and utility. In the end both are working for the same thing, and that thing is the profitable production of eggs and meat. The standard demands in the hen the long back and deep keel without which satisfactory egg production is impossible. In males it demands also the long back, the thick thighs and deep chest which make for meat production, and the alert eye and well-poised head which denote vigor. Above all, it insists on weight, and there is no way in which a flock will deteriorate so quickly as by being allowed to run down in weight. The use of breeders that are under standard weight for two or three years will reduce a flock from a standard-bred flock to an aggregation of runts. We must keep breeding up to weight by the use of breeders that are fully standard size or we shall find ourselves steadily slipping backward.

Now where do we get our standard of weight and type and eye and carriage? Where but at the poultry show? Drop the poultry show for a single year and there will be a slipping back all along the line. Drop it for three

years and our standard, the star to which we hitch our wagon, is gone, and breeding but a haphazard thing without aim or purpose. There is the Standard of Perfection, of course, but who ever reads it outside of professional breeders? It costs too much for one thing. It is hard to understand for another. The fancier buys the Standard of Perfection, studies it comprehensively, and brings to the show the incarnation of the Standard's description. To be sure, this description is not infallible. The makers of the Standard are just ordinary men. But any standard is better than none. Exact shades of color, precise angle of tails are important only to the fancier, but some standard toward which to work is vital to any one who desires to improve his stock.

The farmer, the backlotter, the fancier, and to some extent the commercial poultryman, come to the poultry show as to a school where they may learn what is what and who is who in local and often extra-local poultry work. Our large shows feature stock from all over the state. Every breeder of consequence from Shasta to San Diego sends his stock to the Los Angeles show in January. From these exhibits the rest of us get our bearings for the coming year. Does it show stock weak in color? We learn here exactly where to get a cockerel that will improve color. Are our hens under weight? Eggs from that biggest hen of our particular breed will add size to the whole flock. Is our egg production not what it should be? Here is the weak point of most shows. They might tell us where to find cockerels from high producing mothers, but they do not. A few breeders, but a very few, advertise bred-to-lay stock. There should be many more.

Right in this one point, perhaps, the war, with the utility craze for which it is partly responsible, is going to teach our fanciers a lesson. The farmer and the backlotter are going to demand that the poultry show exhibit something more than fine feathers. At some of our shows there have been exhibits of coops and equipment. We want more of these. Above all we want to know where to buy bred-to-lay stock. We do not mind paying for it, but we want to know that we are getting what we pay for. We want to improve our stock and we want the show to teach us how to do it, not in respect of feathers and eyes and tails alone, but in egg production.

English poultrymen weakened in their support of the poultry show when the war began. They got back on the track ultimately, but it would have been easier to stay on. Let us learn a lesson from them and support the show with all our hearts, but let us demand that it give us what we need. The country must have eggs, if only for hospital use, and it must have meat. The industry must be kept alive at whatever cost, and the show is a vital part of its existence.

## Sodium Flouride for Chicken Lice

NE application of sodium flouride will kill all lice of chickens, the department of agriculture has discovered. This inexpensive white powder will rid a flock of all the seven common species of chicken lice in a few days. One pound,

costing only 40 or 50 cents at the time of this writing, is enough to treat 100 fowls, if dusted on. If dissolved in water and used as a dip, the same amount will go three times as far. It is easily applied, economical, gives immediate results, and does not injure the fowls or the poultryman.

# Poultry can be made to Pay

THERE are two methods of gaining knowledge, necessary to make poultry a success; experience—which is a long, drawn out, expensive road and the one too commonly used. Another method is by the careful studying of books written by practical poultry people who have made mistakes and successes and are willing to give this information in order that you may take the short road to poultry success.

## Poultry for Profit

BY

Jean A. Koethen

Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on egg-shell book, binding full cloth vellum de luxe.

115-117 N. Bdwy. Los Angeles

Sodium flouride—say it plainly to the druggist or you may get sodium chloride, common salt, which it not only resembles in name but appearance—may be obtained at most large drug stores. Until its recent use against conckroaches, and still more recently against poultry lice, this substance had not been employed as an insecticide. The demand for it, therefore, has been quite limited, and it is not ordinarily found in the stock of the small drug store. Druggists, however, can obtain it readily from manufacturing chemists, and with demand, it likely will be carried by local dealers. The finely powdered commercial form is cheaper and more easily applied by the dusting method than the fine, crystallized sodium flouride.

#### Dusting With Sodium Flouride

To apply the material in dust form, place it in an open vessel on a table and with one hand hold the fowl by the legs or wings. With the other hand place small pinches of the chemical among the feathers next to the skin, according to what is known as the "pinch" method, which proceeds as follows: One pinch on the head, one on the neck, two on the back, one on either thigh, and one below the vent, one on the tail, one on either thigh, and one scattered on the underside of each wing when spread. Each pinch can be distributed by pushing the thumb and finger among the feathers as the material is released. If the chicken is held over the vessel, the material which falls from the fowl during the operation is recovered.

The material also may be applied by means of a shaker, but this method has some disadvantages as compared with the "pinch" method. When this method is used the amount of sodium flouride may be reduced by adding four parts of some finely powdered material, such as road dust or flour, to each part of the flouride. The dust, while not poisonous, is somewhat irritating to the nose and throat. If allowed to remain on the skin in any quantity for any length of time, it may cause slight local irritation. For these reasons, those dusting a large number of chickens would do well to cover nose and mouth with a dust guard or damp cloth and to wash their hands occasionally.

#### Dipping with Sodium Flouride

The dipping method is more economical but among many poultry raisers there is a general sentiment against the practice of dipping fowls, largely because most of the dips contain materials which discolor the feathers. The sodium flouride dip, however, is harmless and as compared with dusting is more easily done. As it is necessary that the fowls dry quickly, dipping is most applicable in the southern states and to summer treatments in the north. For lice on young chickens, young turkeys, and in fact all newly hatched or sick fowls, the application of sodium flouride in the dust form is recommended.

This is the way the dip is prepared: In a tub of tepid water dissolve the poison at the rate of 3-4 to 1 ounce of the commercial powder, or 2-3 of an ounce of the chemically pure material, to each gallon of water. The fowls should be held by the wings over the back with the left hand and quickly submerged in the solution, keeping the head out, while the feathers are ruffled with the other hand to allow the dip to penetrate to the skin. The head then should be dipped once or twice and the bird lifted out and allowed to drain a few seconds. A fowl may be treated in 20 to 45 sec-

onds. The sodium flouride solution should not be allowed to remain long in galvanized vessels as its action on this metal is injurious. The solution does not injure the hands unless it comes in contact with sores, when it may cause slight irritation.

In experiments conducted by the department's specialists more than 800 fowls have been dipped at one time, using on the average 5.2 ounces of sodium flouride to 100 birds, at a cost of 13 cents. Labor is also reduced by dipping, the cost being about 58 cents for 100 fowls.

#### REMEDY FOR CHICKEN POX

A writer in the American Poultry Advocate says: "The best remedy for chicken pox that I know is calcium sulphide, sulphide of lime, a daily dose of one grain for every five pounds of the total weight of the flock. This is not easy to buy, may have lost part of its goodness when purchased, and is much trouble to administer. Today I would put the flour of sulphur as a satisfactory drug for treating chicken pox. Several large poultry plants now depend on this, having used it in outbreaks the past three years."

#### CASTOR BEANS

W. R. Nutting of Fresno, always awake to the needs of the producers of California, has been investigating somewhat as to the production of castor beans. No crop grown in California takes more naturally to our conditions, in fact it grows without attention and produces wonderfully. In the past it has not proven profitable because of labor conditions and low price of the oil. War prices now obtaining, however, make conditions look better, and Mr. Nutting advises there is possibility of developing a market for this product.

J. W. Lyon, of the Lyon Hatchery, Gardena, says "It looks to me as if the food commission are overlooking a good bet. A good big crop of young chickens would save more meat than a meatless Tuesday." Of course, on the other hand, broiler factories come back with the statement that no one can raise broilers at present feed prices. But there are feeds and feeds, and by careful watching of the market and buying in large quantities, or still better by growing, so far as possible, green and other feeds on the place, we may still grow meat which will save great quantities of the red meat which will stand for shipment to the Allies and to the trenches.

One feature of the recent poultry show at Modesto was the big utility class. Mr. Eastman of the Fairmead Poultry Farms writes us that they won every entry as follows: first hen, second cock, second pen, gold special for the highest scoring utility bird in the class (all heavy breeds competing), special for the highest scoring pen of Barred Plymouth Rocks.

Fertile land is the first need in farming for profit, the only kind of farming which we wish to encourage. Poor farms mean poor farmers, receiving little from their hard work—and poor farmers mean poor merchants, poor bankers and a poor country. Bringing back and maintaining soil fertility is therefore not only a farmers' problem but it is a community problem in which everyone is interested.

Anyway, cottontails can serve the nation better in rabbit pie than by gnawing fruit trees.

Now is the time to plan for summer shade in the poultry runs.

## Hatch Them All!

This year you've got to hatch a good chick from every hatchable egg and raise them all.

The country needs them. You need them. The meat supply is low and getting lower. Feed is high and every ounce of it must count.

The Buckeye Incubator and Standard Colony Brooder positively insure successful chick raising. They're guaranteed to do it. No guesswork about it.

Given good eggs a Buckeye will produce the full hatch of strong chicks the first time and every time.

Under a Standard Colony Brooder the whole hatch can be matured to a marketable size quickly.

### BUCKEYE

THE PERFECT INCUBATOR

Built up to a standard—not down to a price. Up to a standard of exact performance and certain results—a standard that makes practical the sweeping

#### Buckeye Guaranty

The Buckeye is guaranteed to hatch more chicks and stronger chicks than any other incubator; to operate satisfactorily in any temperature down to freezing; to require no artificial moisture and no attention to the regulator from the time the hatch is started until it is finished. Any Buckeye that fails to meet this guaranty will be taken back any time within 40 days.

Over half a million Buckeyes in use are giving universal satisfaction, insuring success to the beginner and enlarging the profit of the big operators.

You don't speculate with a Buckeye. It's business from the first hatch.

### STANDARD

Colony Brooder

A revolution in chick-raising. Stops brooder losses. Makes three chicks grow where one grew before. Burns hard or soft coal. Self-feeding, self-regulating, simple, safe, sanitary, certain of results. Raises all the chicks. Broods 100 to 1000. We guarantee it and let you write

#### Your Own Guaranty

Write down all you think a brooder should do for you. We'll sign it. And if the Standard does not fulfill your guaranty we'll send your money back. Over 30,000 breeders, big and little, use the Standard and not one failure is recorded.

Buckeye Incubators and Standard Colony Brooders are endorsed by all Agricultural Colleges and Experiment Stations. Sold by over 6000 dealers who are glad to show the machine in operation. Our catalog gives proof of Buckeye success in the most wonderful testimonials you ever read.

Write for it.

### TREES

At a Very Low Price, you can buy these fine Lemon and Valencia trees—special care has been used in budding this stock. Trees are straight with fine healthy foliage—are growing in sandy loam and give exceptionally good promises for producing fine groves. The entire stock will be sold—make early selections. Future profits depend on the selection of the right trees. Phone or write to us now to arrange to have us take you to our nursery in Whittier, to make your selection of these fine trees. LOS ANGELES ICE AND COLD STORAGE COMPANY, P. O. Box 643, Station C. Main 8191; 10053.

Eureka Walnuts are the Best—Grafted on native black roots. We also have some grafted on paradox roots, which means a hardy root system and a very prolific grower. Prices reasonable, write today, tomorrow never comes. Geyer Bros. Walnut Nurseries, 214 S. Alamanor St., Alhambra, Cal.

Here is Your Opportunity to Secure A-1 citrus trees. We offer several thousand 2-year-old lemons: Eureka and Villa Franca, also Washington navel; also several hundred Valencias on sweet root. We call these good trees and we know whereof we speak. ALBERT JACKSON, Upland, Cal.

Let Us Show You Our Ideal twelve hundred acre orchard from which these perfect yearling citrus trees were propagated. Healthy straight stock, budded one foot high on sour root growing in our own nursery. References: R. R. Morris, East Whittier, Cal.

Placencia Perfection Walnut Trees on black root. Still have a limited supply of first class stock. Scions used in grafting taken from trees showing a high record for crop and quality after seven years of careful selection. Hugh T. Thomson, Orange, Cal. Phone 502R1.

For Sale: Citrus Trees—Choice stock, young and thrifty. Selected buds, Valencias and Washington Navel, Eureka and Rialto seedless lemon. Marsh seedless grapefruit; also young seedlings. W. W. Burns, 631 Security Bldg., F. 3110. Los Angeles.

Pear Trees—Offer several thousand Bartlett's, 2 and 3 feet, heavy caliper at 9c each. French prunes. Trees of all kinds. No agents; we sell direct. Write for price list. Carlton Nursery Co., Carlton, Ore.

By Far the Lowest Priced means of reaching a buyer for what you have to sell is through classified advertisements in California Cultivator. The cost is only 3 cents per word per issue, with a minimum of 35 cents.

For Sale—170 two year old Placencia Perfection walnut trees on Eastern black root in orchard form, 50c each or exchange for Valencia orange trees. H. E. Hunt, Anaheim, R. D. 4, Phone Sunset 115-R-3.

Valencia, Orange and Eureka Lemon trees one year past, ¾ to 1 inch. Pedigreed stock on sour root, high buds. We will bud 6000 choice seedlings to your order. Seed bed stock for sale. Randall Bros. Nurseries, Whittier, Cal.

For Sale—Valencia trees, extra fine yearlings, straight, thrifty, sour root, high buds, not fertilized, fine soil for balling. Will contract for spring planting. S. R. Coate, Anaheim, Cal.

Olive Trees—Mission, Manzanillo, Ascolano. Propagated by me from trees of known bearing qualities. Guaranteed. L. T. Schwacofer, Hemet, Cal.

Citrus Trees—All kinds, any quantity. Butler's Morning Side Nursery, Lamanda Park, Cal.

Walnut Trees—Placencia Perfection, selected grafts guaranteed stock. Wm. Pollard, South Pasadena, Cal.

Fig Trees—Thrifty, large Calmyrnas and Capris. Correspondence invited. C. A. Nelson, Exeter, Cal.

Apricots, Olives, English Morello Cherries and Arizona Ash. First class trees. C. E. Moyer, Hemet, Cal.

For Sale—French Mayette and Payne Walnut grafting wood, 5c foot. Bowman-Kuhn Ranch, San Jose, Cal.

Apricot Trees For Sale—A choice lot. Carsten Truelsen, Nurseryman, Hemet, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

### WANTED

Educated Holland Born American Citizen, age thirty-two, with family, desires position on ranch as manager on shares or salary. Experienced in dairying. Good dairy on shares preferred. Best of references furnished. Address Box 15, Cultivator, 112 Market Street, San Francisco.

Married Herdsman wishes position. Long experience raising hogs, feeding, fitting, exhibiting, etc., and serum and virus treatment. Understand dairying, calf raising, Babcock test and tuberculin test of cattle. A. A. Trask, Berkeley, Cal.

Position Wanted as manager of orange orchard. Best of references given. Geo. F. Whitmore, 1653 4th Ave., Los Angeles. Phone West 2368.

Wanted Work on Farm for experience in western crop raising. Plowing, irrigating. H. DeCou, Gen'l. Del'y., Los Angeles.

Wanted, nine hundred Nonpareil and three hundred Peerless Almond trees. O. J. Backus, Rosamond.

### HOGS

The Billiken Brand of Chester Whites—Entirely sold out of bred sows and gilts. Have a few open gilts of March and April farrows; also 6 boars, same age. Have 9 young tested sows to offer for late December shipments. These have each farrowed once and will be bred for a late March or early April farrow. Fall pigs, both sexes, now being weaned and will be ready for delivery during December. Good breeding stock is getting very scarce and rapidly increasing in value. If you want some of this easy feeding, melon type, get busy with your orders. C. B. Cunningham, Mills, Cal.

Grape-Wild Farm Berkshires—World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

Four Good Boars ready for service is all I have left out of the twenty I had six weeks ago. These are the low down, big bone heavy kind that will just do a world of good in that pork producing herd. They are worth \$100 but \$50 is the price shipped on approval. Less than two months until the big Kings County Poland-China Sale. Bernstein sells twenty sows that are real BEAUTIES. They will please you. Bernstein's Ranch, Hanford, Kings County.

Superba, World's Grand Champion Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

Berkshires—First prize junior boar: first and second senior boar pigs including junior champion; fifteen spring and fall open gilts sired by Ames Rival 115, champion boar; and two junior yearling bred sows priced cheap for immediate sale. F. D. Hall, Ferris, Cal.

We Pay Cash for Hogs of All Sizes, weights and breeds. Any number from one to several thousand considered. What have you? Durbin and Forbes, 722 San Fernando Building, Broadway 4170, Los Angeles.

Big Type Durocs—Well grown out February and March pigs of either sex in any quantity. We ship only the tops and butcher the culls. F. M. Johnson, Napa, Cal.

Most Money in Duroc-Jerseys—Bred sows and weanlings, either sex all the time. Delta Farm and Live Stock Co., Colton, Cal.

Large Yorkshires—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

PLW Durocs—Eastern selections made by R. K. Walker in January. Peters, Lamson & Walker, Devore, San Bernardino County.

For Sale—Thoroughbred senior yearling Duroc-Jersey boar, eligible for registry, pedigree furnished. E. A. Hunter, El Toro, Cal.

Large Type Poland-Chinas are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, Cal.

Rancho Rubio Durocs all sold out except some choice fall boar pigs. Write for prices. Elmer Lamb, Ceres, Cal.

Greenwood Farm Durocs—"Size with quality." H. C. Witherow, Palo Cedro, Shasta County, Cal.

Berkshires—Sired by Star Leader, the \$1,500 boar, ready for service. Kounias Registered Stock Farms, Modesto.

Durocs—P. & L's Defender by Defender heads herd. Joseph Prendergast, Route 2 Box 87A, San Bernardino, Cal.

Registered Durocs of the big type—Cholera immune. Derryfield Farm, Odd Fellows Building, Sacramento, Cal.

Carruthers' Farm Berkshire Hogs—Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

Poland-Chinas—A few good breeding boars. S. F. Williams, Orland, Cal.

## MY CABIN

Written for California Cultivator  
By Ida M. Blake

I'm so tired of the city,  
Its noisy roar and din,  
And I think of my little cabin  
And its welcome, "Tumble Inn."

It's just a mountain cabin  
Of logs and stones unhewn,  
But it's near the heart of nature,  
Where the world is e'er in tune.

It nestles on the hillside,  
Beneath the big oak trees,  
Where all is calm and peaceful,  
And you hear the hum of bees.

You can hear the merry brooklet  
As it flows o'er rock and rill,  
See it glisten in the sunlight  
That comes peeping o'er the hill.

Where birds are ever singing  
Their happy songs of cheer,  
For life is always joyous,  
They worry not, nor fear.

Hear the saucy squirrels chatter,  
As they hop from bough to bough,  
"Oh come and live in the mountains,  
And let Mother Earth tell us how."

## THE PROVIDENTIAL WELL

Written for California Cultivator  
By Caroline M. True

S Mrs. Leighton straightened up from lighting a great pile of sage, she was surprised to find the sun almost down.

Looking regretfully at the unburned rows ahead, she called the children who were raking up sage farther down the field.

"O, why can't we finish, Mama, you know Papa has to plow the ditches tomorrow?"

"Well, here he comes, we'll ask him if he wants it finished bad enough to have a late supper."

Mr. Leighton came slowly across the field, driving the big gray team hitched grotesquely to each end of a long railroad iron which left in its wake a broad swath of torn up sage brush. As he came to where his wife and children stood waiting, he stopped, pushed back his hat and wiped the perspiration from his brow.

"You and the Kids are making a fine showing," he said, looking appreciatively over the wide clear strip behind them.

"Harry says you wanted this finished tonight so you could plow the irrigation ditches tomorrow. Shall I let the supper wait while the children and I finish it?"

"Not by a long sight, I am as hungry as a dog right now. We will make some fireworks out of it tonight."

"O, goody," said little Marjorie, "I love to see the sparks fly."

"All right, you and Harry and Jim dust down there and finish the stacking while Mamma gets supper and I put up the team and do the chores, and right after supper we'll all come out and make the sparks fly."

With a whoop, they scampered to their unfinished task.

"I'll tell you what, Ethel, this level field looks mighty good to me."

"O, I know the land is all right, but what scares me to death is the fear that the well borers won't strike water."

Mr. Leighton threw back his head and laughed heartily.

"You must think we are awful mean, for Providence to discriminate against us that way."

"Any one that digs for water in this country, shouldn't blame the Lord if he don't find it," she retorted.

"But, My Dear," he expostulated, "when they have found water on both sides of us, how can we help striking it?"

"Of course I really think we will; if I didn't I should simply die right

now; there's too many plans and hopes bound up in this place, I can't tolerate the idea of any thing interfering with them."

"O course not, but you shouldn't worry so much. You remember how long it took to persuade you to come to California after the earthquake. If that cyclone hadn't have taken the roof off our house last summer I don't know as we would be here yet."

His wife shuddered.

"Don't talk about that; it scares me yet. Any way, we don't have cyclones here, but I must hurry or supper will be late."

The next day about the middle of the forenoon, little Marjorie came running in, exclaiming breathlessly:

"There is a big dust coming up our road." Our road was a long wandering cut-off across the open sage, which no one used unless coming to the ranch, so a dust on it proclaimed visitors as a rule, though some times only a whirlwind. But today the dust grew to a thick cloud and finally resolved itself into a tractor, pulling several heavy wagons laden with strange machinery, a very tall derrick and a camping outfit. Marjorie stared in round eyed wonder, and Mrs. Leighton was puzzled for a moment, but suddenly realizing what it must be, exclaimed: "It's the well rig at last."

Marjorie sped away to tell the boys who were grubbing sage at the other end of the ranch, while her mother tried to resume her work, but found she could keep neither her eyes nor her interest off the setting up of the well rig, which the children were watching with all their eyes and with which her husband was helping. It looked dangerous, as they lifted the great derrick and guyed it with large cables. She hoped Harvey would be careful and warned the children not to go too close.

At noon Mr. Leighton came in jovial and elated:

"Well, they are ready to start after dinner, and Stine says they will have the surface well down by night if everything goes well."

"Can he tell from that whether the deep well will flow?" asked his wife.

"He says he can make a pretty good guess, but of course can't be certain until he sees the water running."

All through the afternoon the great drill bit into the soft earth, and, down, down sank the rods. By the time water sand began to appear on the dump the whole family were watching eagerly.

"Well, Folks, we've struck it," he said, as he dumped out the shining sand, "but it is a little deep, and you mustn't be surprised if your well doesn't flow."

It had happened. The well wasn't going to flow, and they didn't have enough money to put in a pumping plant. Mr. Leighton had looked that up some time ago. The parents exchanged despairing glances, and the expectant faces of the children fell in sympathy. The mother tried to rally her sinking spirits by remarking:

"At least, we know now that there is water here."

"There has never been any doubt of that," said the well borer, "and if the deeper strata are strong, I may get you a flowing well yet. But you are on the border line here, and it is very uncertain; though you have much better land than if you were in the heavy flowing district."

**LAYNE & BOWLER PUMPS**

THE WAY TO BIGGER CROP PROFITS

Next year will be the Farmer's greatest season in which to make money. Prepare to raise big crops. Be sure your irrigation facilities are adequate. Take no chances. Better install a Layne & Bowler Turbine Centrifugal pump and minimize your crop risk.

Ask for Catalog No. 30—it gives full information regarding these pumps.

**Layne & Bowler Corporation**  
900 Santa Fe Ave.  
Los Angeles

## The Cultivator Patterns

8185—Ladies' Waist. Cut in sizes 36, 38, 40 and 42 inches bust measure. This is a blouse waist and the large collar and cuffs are trimmed with frills.

8637—Children's Dress. Cut in sizes 2, 4, 6 and 8 years. The lower part of the dress is gathered to the yoke at front and back, and a pretty lace-edged collar finishes the neck.

8102—Ladies' Box Plaited Waist. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The lower section of the waist is box plaited to the fancy yoke.

8638—Misses' and Small Women's Dress. Cut in sizes 16, 18 and 20 years. The waist is quite plain, and the straight gathered skirt is joined to the slightly raised waistline.

8608—Ladies' Kitchen Apron. Cut in one size. The bib is large enough to be a good protection and it is held in place by narrow straps which cross and button on the belt at the back.

8412—Girls' Long Waisted Dress. Cut in sizes 6, 8, 10, 12 and 14 years. The long waist is quite plain, and a one-piece skirt is gathered to the waist.

8616—Misses' and Small Women's Box Plaited Skirt. Cut in sizes 16, 18 and 20 years. This is one of the new shallow plaited models which has box plaits.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

### HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

California Cultivator  
Los Angeles

"That's some comfort," said Mr. Leighton, "and the fact that it does not flow wouldn't bother me a bit if I had the money for a pumping plant."

The succeeding days to the anxious family resembled those spent by the bedside of a patient, awaiting the crisis. They harassed the well borer with questions as to his progress until his patience was on the breaking point.

"I tell you, Folks, you never know what you are going to run on to underground; no two wells are alike."

At the end of the week they struck a very strong stratum, and the hopes of the watchers rose high; they could hardly wait until a clay formation would permit them to anchor the

said, suddenly calm now that she knew the worst, "Papa will find a way to get it on the land. The main thing is to get a good well and we have that."

When Mr. Leighton came in to breakfast he announced the water at ten feet. The family ate breakfast in a very unusual silence. Even the spirits of the children failed to rise. At its close Mr. Leighton rose slowly and stood uncertainly by the table, considering.

"My plans are so upset I hardly know what to do," he said finally.

"I believe the best thing to do is just to finish our clearing and get the ditches ready, as though everything was all right, and we can think it over,

"It is so warm for the time of year, I should be almost afraid of a cyclone if we were in the East," said Mrs. Leighton, as they went in the house to prepare for bed.

Several hours later Mrs. Leighton awoke with a peculiar impression of something impending. She could not tell what had disturbed her, but lay listening anxiously as though she expected to hear something. Suddenly every window in the house began to rattle, and the bed rocked back and forth. She sprang out of bed and rushed for Marjorie's bed, screaming:

"Harvey, get the boys, quick, there is a cyclone coming." Mr. Leighton sat up, startled and half dazed, then rushed to the window and looked out at the calm and peaceful night.

"Why Ethel, you must have had a nightmare, there isn't a breath of wind blowing."

"A nightmare could not rattle the windows and shake the bed," she replied.

"That describes an earthquake," he said. She sat down suddenly upon the bed and gasped:

"Of course that was what it was, why didn't I think of that at first?"

"Your logical mind had never experienced one," he laughed.

"If that is all there is to it, it isn't much of an experience," she said, "but I am sure I shan't sleep any more tonight for fear of another one."

"Nonsense, such slight shocks don't amount to anything, and, even if we had a hard one, there's no danger in these low California houses."

In spite of this assurance, it was almost morning before she fell asleep, and immediately afterwards she was awakened by her husband, shaking her excitedly.

"What is it," she cried, "is it another one?"

"No, but just come and see what that one did!"

Seizing a dressing gown, she hastened after him, her mind filled with dire forebodings. Once outside, she stood transfixed with wonder, for before her eyes, every drop shining in the sun, arose a great column of water. The well was flowing at last.

As if fascinated, the whole family moved nearer and nearer until the spray sprinkled their faces. Silently they looked upon the miracle with mingled feelings of awe and reverence. Suddenly Harry darted toward a little pool and held up something shining in his hand.

"A fish, Papa, just look, a fish."

"It can't be," said his mother.

"There are no fish in wells."

"But it is," said his father, who was examining it, "and a blind one at that. I'll tell you what has happened. The earthquake has connected us with an underground lake."

"I am afraid we are all crazy, and this isn't really happening; such things never happen outside of Rider Haggard's novels," said his wife.

"Let's stay crazy then. Harry, get your pony and hurry over and tell Mr. Stine to come and cap this well before all the fish get away."

### SAMMIES

History records that American troops were first called Sammies in France, and history has put her foot in it, not for the first time. An eye-and-ear witness of the landing now reports that what the French crowd shouted was not "Sammee!" but "Nos amis!" — pronounced "nose ammee," and by interpretation, "our friends." Some bystander caught only part of the outcry. Hence "Sammee." Hence in its turn "Sammy."

Our troops are not pleased with

## What Food Saving Involves

Sign the pledge and enroll as a member of the United States Food Administration, and you will be asked to do these things:

**Eat plenty, but wisely, and without waste.**

**Buy less; cook no more than necessary; serve smaller portions.**

**Preach and practice the "gospel of the clean plate."**

**Use local and seasonal supplies;— watch out for waste.**

**Whenever possible use poultry, game and sea foods in place of beef, mutton and pork.**

**Use potatoes and other vegetables freely.**

**Save wheat by substituting, in part, corn meal and other cereal flours for wheat flour.**

**Save butter and lard. Use butter on the table, but substitute vegetable oils for cooking.**

**Save sugar. Use less candy and sweet drinks and less sugar in tea and coffee.**

"This is a duty of necessity, humanity and honor. As a free people we have elected to discharge this duty, not under autocratic decree, but without other restraint than the guidance of individual conscience."

—Herbert Hoover.

well. This was reached at 300 feet, and the boring was finished.

The next day at dinner time Mrs. Leighton remarked:

"Why don't the wellborers stop for noon? They seem to be pounding away as hard as ever."

"He told me that he wouldn't dare stop until the casing was all in for fear of losing the well."

"What new bugbear is that? At first we don't know whether there is any water; then they're sure it won't flow, and now they talk about losing it all together?"

"I don't care," blurted Harry, "if they go and lose it they won't get no pay, for they said they would give you a whole well."

Mr. Leighton chuckled at the consternation his words called up:

"I don't believe we need worry," he said, "they don't mean to lose it. He said they would probably work most of the night."

There was only a pink glow in the east when Mrs. Leighton came to the kitchen to prepare breakfast, but her husband and sons had already departed for the well rig, over which hung an ominous silence as though it was worn out and had given up. She hardly had the fire going before the boys rushed in, almost wailing:

"It didn't flow! It didn't flow! Mamma."

"Don't worry about it, Boys," she

and may be something will turn up, meanwhile," said his wife, cheerfully.

"You are a regular old Micawber," laughed her husband.

"Just remember something good 'turned up' for dear old Micawber in the end," she returned.

Several weeks had elapsed when one evening the family gathered on the porch to enjoy the beautiful afterglow of mid-October. Mrs. Leighton leaned back in her big willow rocker and looked forlornly across the dry, sandy stretch of level soil that formed her front yard:

"I did so want to get my lawn started in the spring," she sighed.

"Yes, and I meant to get the south 40 all ready for alfalfa," added her husband in the same tenor.

"And I was going to have a fish pond in the reservoir," said Harry.

They all laughed at that and called for Jim's and Marjorie's plans. Jim owned up that he wanted to learn to swim in the reservoir, and Marjorie had the promise of wading in the ditches.

"You see you worried about the wrong thing before we came out here; instead of earthquakes it should have been water."

"I have a logical mind and could not worry without data; the papers were full of the San Francisco earthquake."

They sat till far into the evening, discussing ways and means and enjoying the soft, balmy air.

the sobriquet. They protest. We fore-saw their indignation and printed several weeks ago some paragraphs entitled "Nix on Sammy." But the sobriquet sticks. We doubt if "Samson" proposed as a substitute, will manage to supplant it, nor do we quite see why it should. Already the nickname has become glorious. It is the dignity of an honorific title. At the same time it has the endearing jollity of a slap on the back.

Bear up Sammy! T. Atkins once hated being a Tommy. Look at him now. There was a blunder at our christening. Admitted. But we guess that if "Sammy" ever failed to reflect credit on you, you are now reflecting abundant credit on "Sammy."—Chicago Tribune.

HOW TO REMOVE STAINS

**U**NCLE Sam says that if the housewife knows the cause of a stain she can find a commonsense way to get rid of it by following the directions given in Farmers Bulletin 861. Methods are outlined for the removal of practically any kind of stain, from "acids" to "whitewash." This bulletin will be sent free to anyone who writes Department of Agriculture, Washington, D. C., requesting it.

One of the first requisites in removing stains, says the bulletin, is to know the kind of fabric which is spotted and, if possible, the nature of the stain. Some stain removers which will give admirable results on cotton or linen may, if applied to woolen or silk, remove pieces of the fabric as well as the stain. Likewise, stain removers which are entirely satisfactory for cleaning silk or woolen materials cannot always be used for removing stains from vegetable fibres, such as cotton or linen. Similarly, treatment which will remove some stains immediately will cause those of a different nature to take firmer hold on the fabric.

The second cardinal principle in spot removal is to work while the stain is fresh. Cold or lukewarm water is usually the housewife's first best bet if the nature of the stain is not known and if the fabric is not injured by water. Hot water should not be used until it is determined that the staining material is such that it will not be "set" by heat. Stains from meat juice, blood, egg, milk, and other materials containing protein are set by hot water.

THE RIGHT WAY TO COOK DRIED FRUITS

As commonly cooked dried fruits are insipid. This is due to improper cooking. When cooked properly, the natural flavors are developed and, in the case of some fruits—prunes and figs for example—no sugar should be added. The fruit should be washed in several waters, then soaked in an excess of water for 24 hours. It may appear tender at the end of this soaking period, but, as has been said, it must be cooked to give flavor. A short cooking will not do this. The best method for cooking is slow stewing, although baking will also develop the flavor. It can be cooked slowly in the furnace or put on the back of the stove when the housewife is baking or washing. If sugar is to be added, as will be necessary with apples, peaches or apricots, it should be added just a few minutes before the fruit is removed from the stove. This helps to give the fruit a fresh flavor.

There are a great variety of dishes that may be prepared from the dried fruits. There is no excuse for them

always appearing as a sauce. Short-cakes using the different fruits may be varied by different sauces, as hard, marshmallow or custard sauce. Cooked dried fruits will be found to be attractive and palatable in almost any gelatine desert. They are excellent for cobbles and fruit puddings, also. —Magdalene Hahn, Colorado Agricultural College.

VALUE OF SKIM MILK

While skim milk is good for stock, the fact remains that its highest ef-

Official uniform of the Food Conservation section of Food Administration. Pattern may be obtained by mailing ten cents to Food Administration, Washington, D. C.

iciency can not be had through turning it into meat. Skim milk is used most economically in animal production when fed to hogs, yet it takes 20 pounds when fed alone to produce one pound of pork. The same quantity will make three pounds of cottage cheese. In addition, cottage cheese contains 1½ times as much protein and one-third as much energy as pork, so that the skim milk in the cheese form gives quite as much energy and 4½ times as much protein as it would if converted into ham or bacon.

Even at the highest prices paid for hogs, skim milk fed to them is worth not more than one cent a pound. Yet one cent a pound, or approximately one cent a pint, is very cheap for any human food, and particularly for a food so high in nutritive value as skim milk.

FACTS ABOUT FOOD CONSERVATION

In Europe fines up to \$500 are levied on persons who throw away stale bread.

The success of food conservation in American homes depends entirely upon voluntary action.

Our Allies are dependent on us for food because the route to North America is the shortest and the safest.

Scarcity of ocean-going ships makes it important for us to export foods of concentrated value, such as meats, sugar, wheat, condensed milk and fats.

The success of the Allies will depend largely on winning the war against food waste in this country. It is now being waged in 22,000,000 American kitchens. Are you winning yours?

The people of the United States consume double the amount of fatty foods needed for proper nutrition. Our European Allies are suffering privations from lack of sufficient fat in their diet.

CRYSTALLIZED FIGS

White figs are best for this. They should be well washed and dried. Make a very thick syrup. Boil figs in this for one hour three days in succession, removing them at the end of hour to platter. Put them in the sun, bringing them in at night. After the three days' boiling put in the sun each clear day until they are perfectly dry. Then pack in tin boxes lined with oiled paper.—E. A. Tomblor in Sperry Cook Book.

NEW WAY TO DARN STOCKINGS.

A new way to darn the knees of children's winter stockings is to run the threads from side to side of the hole, then begin at the top and chain-stitch down, catching the stitch in each crossthread. When the hole is mended it will look like the knitted part of the stocking.

THE LATEST

After showing stacks of table cloths, the clerk brought out another lot. "Now these are the newest patterns," he said. "You will notice that the edge runs entirely around the border and the center is in the middle."

"Isn't that lovely!" said the lady. "I will take a half dozen of those."

## HOPS

Per lb.: California crop of 1917, 28@  
33; on contracts, spot, 1916 crop, 18@22;  
old, 8@15.

## RICE

California rice, new crop, cleaned, 100  
pound head rice, 6.45@6.50; brewers, 5.25;  
screenings, 5.37½.  
Rough rice, 100 lbs., 3.50@3.60 to grow-  
ers at shipping points.

## HAY

Under date of December 29, Scott,  
Magner & Miller says:  
Arrivals of hay for the week were 1356  
tons.

There are no changes to note either in  
the market or the railroad situation. It  
is still most difficult to obtain a sufficient  
amount of cars at the various shipping  
points to fill orders.

There have been no government orders  
placed in California other than those  
noted in our last report. At the same  
time the news of the government order-  
ing a full and complete division of 40,000  
men to Camp Fremont will probably have  
its effect on the hay situation as without  
doubt the usual number of animals to ac-  
commodate this number of troops will  
naturally have to be there also.

The local situation is somewhat ser-  
ious. Even though we have had a  
shower amounting to as much as an inch  
of rain in some localities north of San  
Francisco, we have had very little mois-  
ture to speak of south of San Francisco,  
and stockmen are facing a most serious  
situation as there is practically no pas-  
ture and baled hay is at such figures that  
they cannot afford to buy it to feed their  
stock. The food administration in  
Washington is considering the necessity  
of placing restrictions on the hay trade  
similar to those found necessary in other  
lines. In confirmation of this a dele-  
gation of hay men were requested to meet  
the food administration in Washington  
some ten days ago to formulate rules to  
cover the hay trade. The result of this  
meeting has not been announced as yet  
but may be expected shortly. This may  
have a decided bearing upon prices later  
on and especially for the new season.

Fancy Wheat Hay  
(light 5 wire bale) ..... 29.00@30.00  
No. 1 Wheat or Wheat and

Oat Hay ..... 26.00@28.00  
No. 2 Wheat or Wheat and  
Oat Hay ..... 23.00@25.00  
Choice Tame Oat Hay ..... 27.00@27.50  
Other Tame Oat Hay ..... 23.00@25.00  
Wild Oat Hay ..... 23.00@25.00  
Barley Hay ..... 24.00@26.00

## GRAIN

Grain Exchange prices, cwt.  
Corn, Cal. Yellow, cwt. .... 3.30@3.40  
W. Egyptian, 3.20@3.25; Brown 3.05@3.10  
Barley, Feed & Brewing, cwt. 2.85@2.87½  
Milo ..... 3.05@3.20  
Oats, Red Seed ..... 3.00@3.25  
Feed ..... 2.77½@2.85  
New Black ..... 3.40@3.60  
Wheat—Government prices: Common  
white hard, base price is \$3.50 per cental,  
or \$2.10 per bushel of 60 pounds deliver-  
ed in terminal warehouses in bulk; soft  
wheat, base price 2 cents per bushel less,  
or \$2.08 per bushel; white club (including  
Sonora), \$2.06 per bushel. If wheat, after  
cleaning, weighs 60 pounds or more to  
bushel, base price stands; if 58 to 60  
pounds to bushel, 3 cents per bushel re-  
duction; if 56 to 58 pounds, 6 cents per  
bushel less; if less than 56 pounds, grain  
becomes sample grade and sells on its  
merits up to within 1 cent per bushel of  
56-lb. wheat. Sacked wheat 4 cents per  
bushel more, less tare for weight of  
sacks.

## FEEDSTUFFS

Wholesale prices per ton:  
Bran ..... 35.00@40.00  
Cornmeal ..... 81.00@82.00  
Cracked Corn ..... 81.00@82.00  
Cocoanut Meal ..... 45.00@46.00

Alfalfa Meal ..... 32.00@33.00  
Rolled Barley ..... 58.00@60.00  
Shorts ..... 41.00@42.00

## SEEDS

Prices in round lots, lb.:  
Millet, recleaned ..... 4½@5  
Alfalfa ..... 20@21  
Flax ..... 6@6½  
Rape ..... 2½@3

## Citrus Fruit Market

Los Angeles, Jan. 2, 1918.

The calendar year ended with a total  
shipment of citrus fruit from all Califor-  
nia of 22,441,902, or a total of 55,870 cars  
of 400 boxes each. Prices have been the  
biggest ever in the history of the indus-  
try. The output for the next 12 months  
will be little more than half that, but  
prices promise to be even higher than  
last year. At the present moment the  
entire Eastern market is taking every  
orange and lemon offered at long prices.

## Shipments

Total shipments of citrus fruits from  
Southern California since November 1,  
1917: Oranges, 2069; lemons, 494; total,  
2563. To same date last year: Oranges,  
2348; lemons, 717; total, 3065. From Cen-  
tral California: Oranges, 1616; lemons,  
60; total, 1676. Same date last season:  
Oranges, 3542; lemons, 104; total, 3646.  
From Northern California this year: Or-  
anges, 178. Last season to same date:  
Oranges, 809.

Boston: 4 cars Nav. 2 Lem. Nav.  
\$2.45-\$5.05, Lem. \$1.55-\$6.40.

## MARKET NOTES

Telegraphic reports from truck crop  
sections of California indicate a decidedly  
poor condition of cauliflower and lettuce,  
with other crops, excepting celery, show-  
ing fairly well. Celery crop has been ser-  
iously injured by the extreme dry  
weather, and more than ten per cent of  
the acreage has been cut. Prices have  
been low, not much better than half of  
last year. The cauliflower injury has also  
been because of the drouth, both ship-  
ments and prices lower than last year.  
High quality lettuce has not begun to  
come into the market yet, but will within  
a very few days.

Truck crop conditions are: Asparagus,  
93; artichokes, 85; cabbage, 82; carrots,  
89; cauliflower, 70; celery, 79; tomatoes,  
86; lettuce, 78; onions, 87; peas, 86;  
spinach, 88; strawberries, 87; turnips, 84.  
Four hundred acres of Brussels sprouts  
in San Mateo County, seriously affected  
by dry weather, have been given tem-  
porary relief by light rains of last week.  
Imperial Valley lettuce is making the  
largest heads ever shown. It is charac-  
terized as a 100 per cent quality crop.  
Imperial Valley is beginning the planting  
of 9000 acres cantaloupes.  
Truck crops in Atlantic states north of  
Florida have been injured by severe  
cold. For instance, South Carolina cab-  
bage crops reported 40 per cent of nor-  
mal and lettuce 50 per cent. In Louisiana,  
conditions are much better, lettuce, on-

ions, beets and other similar crops ranging from 70 to 75 per cent of normal. Florida reports condition of cabbage, 85; celery, 80; lettuce, 75; onions, 80; peppers, 50; strawberries, 75; tomatoes, 60 per cent of normal. Thrrips are reported doing serious damage to cabbage and onion crops of Texas. Spinach is also being seriously injured, one county of the state showing 50 per cent of normal. Coachella Valley onions promise large crop of exceptionally fine product. Central California will ship 1000 cars of celery. Post card reports to the bureau of markets of the United States department of agriculture show shipments from California during the week ending December 31, approximately as follows: Apples, 4 cars; cabbage, 3; cauliflower, 48; celery, 67; dried figs, 5; dried fruit mixed, 92; lettuce, 34; mixed vegetables, 46; mixed fruit, 5; onions, 6; olives, 1; peas, 1; potatoes, 49; raisins, 118; sweet potatoes, 7; squash, 2; tomatoes, 1.

WE NEED MORE SHEEP

**W**OOL from 20 sheep is used to make the clothing and other equipment of one soldier.

Six farms out of every seven in the United States have no sheep.

Sheep can be produced profitably on almost every farm.

What about your farm? If you keep 20 sheep you are outfitting a soldier who is risking his life for your freedom. If you have a flock of 200 sheep you will clothe ten men who are fighting in France. And if you have no sheep you are failing to do all that is in your power to help win the war.

Get some sheep.

They make both meat and wool—and both are badly needed. By proper management they can be produced on the average farm without entailing a reduction of other live stock and without interfering with any other agricultural plans.

More than the entire wool production of the United States will be used for our armies. Where will we get the wool to make clothes for the civilians? Every ship is needed to transport men and supplies from America to Europe. Unless the necessity is extreme we can't spare ships for long voyages to Australia, South Africa and South America to get wool. Furthermore, those countries have not increased their production. The problem must be solved by the production of more sheep on farms throughout the United States. We must produce our wool at home instead of hauling it from the other side of the world. We can do that if the six farms out of seven that have not kept sheep will begin to build up flocks in proportion to the size of the farm—at the ratio of one sheep to each three acres. We can do it if you will put some sheep on your farm.

You will be helping produce clothing and meat for our soldiers and yourself. You will be helping win the war. You will be making more money from your farm.

Sheep, in proportion to the value of their products, are produced more economically on the farm than any other live stock; the feed and labor requirements are less. They fit in with practically every kind of farming, get much of their subsistence from forage, from grazing weeds and grass that would not support other stock. They eat almost no feed that has a value as human food, and need less grain than other animals. They add materially to the farm revenue but add very little, relatively, to the farm expense.

Since 1914 wool and mutton prices have doubled and some grades of wool have trebled. Those who are in close touch with the sheep industry believe that attractive prices will continue. During the war over-production seems impossible.

The United States now has 1,200,000 fewer sheep than in 1914. Our

production of wool has steadily declined since 1910, when it was 321,362,750 pounds, to 290,192,000 pounds in 1914, 288,490,000 pounds in 1916 and 285,573,000 pounds in 1917. But while our production decreased our manufacturing consumption increased, from 550,356,525 pounds in 1914 to 737,679,924 pounds in 1916. In 1917 the amount manufactured will be even larger, and it seems certain that it will continue to increase during the war.

The difference between the amounts we produced and manufactured represents our wool importations from other countries. We have gotten into the habit of using a great deal more wool than we produced—we'd just send over to Australia or South Africa or perhaps somewhere in Asia and get what we needed. But the ship shortage now interferes with that uneconomic arrangement—which, in the long run will be a very valuable thing for America. Present war necessities will teach us the lesson we would have had to learn at some time—to establish sheep production permanently as a part of general American agriculture.

The need is immediate as a war measure. But war or no war it would have been necessary for us to produce more sheep. A man cannot draw money out of a bank indefinitely unless he makes deposits. We were constantly consuming more wool and mutton, but raising fewer sheep. The principal sheep countries were not increasing their productions before the war and seemed to have reached their maximum. There was a discrepancy between consumption and production that was rapidly becoming critical. The war brought the problem to a crisis.

What about your farm?

Is it one of the six out of seven farms in the United States that have no sheep?

Get some sheep!

Remember that 20 sheep will clothe a boy who is risking his life "over there."

SILAGE FOR HORSES, SHEEP AND SWINE

By Wm. Hislop

**H**AY, grain, mill feeds and oil cake have reached such forbidding prices as to discourage some stockmen. Men who have silos are less fearful of "dried-up" pastures and winter feed than those who have none. Silage, however, is not a panacea for all these troubles, but it mitigates them to a very large extent. Dairymen are given credit for having used silage first, and some people think that it is a feed fit only for the dairy cow. True, the use of silage and profitable dairying are closely associated, but such are not its limitations.

Horses and Mules

Experiments at the Pennsylvania, Missouri and North Carolina stations have shown that corn silage can be used as a part of the rations for all classes of horses and mules. Mouldy, spoiled, rotten acid or frozen silage is very unsafe as a horse feed, and none but the best should be fed. A good daily ration for a 1400 pound draft horse at work consists of 15 pounds silage, ten pounds legume hay and ten to 12 pounds oats. Idle horses can consume profitably about 25 pounds silage daily plus ten to 12 pounds hay. Weanlings, yearlings and two year olds will make satisfactory growth when silage constitutes a part of their roughage. In addition, they should receive some grain and hay. Mature-in-

foal mares, have produced strong foals on a ration of legume hay and corn silage. Silage is also a very excellent winter feed for horses on dry or oat and wheat straw. Many horses in the wheat belts of Washington would be in better shape for spring work if they received some silage. In starting horses and mules to eat silage only three or four pounds per head should be given daily along with other feeds. The silage should then be increased and the other feeds decreased.

Sheep

As with horses, the addition of silage to rations for all classes of sheep reduces their cost and supplies succulence, palatability, and variety. Likewise, rotten, mouldy, sour or frozen silage should not be used. Pregnant ewes should receive from three to four pounds per head daily during the winter. This should be supplemented with two or three ounces per head daily of cottonseed cake and some hay. After the lambs are born silage increases the milk flow of the ewes. In the fattening of lambs and yearlings for market, the cheapest gains have usually been made when silage constituted a part of the ration. Rams winter well on silage as a part of their feed.

Cattle

Silage is just as indispensable to successful beef-cattle raising as it is to successful dairying. In fact, during these times of high priced feed-stuffs it is highly essential. As with sheep and horses, silage alone is too wide a ration. Cattle receiving silage exclusively will not do well. Cotton-seed meal, linseed-oil meal, clover, alfalfa or pea hay should be fed with it. Fattening steers will eat 20 to 25 pounds per head daily. Wintering yearlings will do likewise. Calves may be fed all the silage they will clean up twice a day. Grain and legume hay should, in all cases, be fed in addition. Bulls also thrive on silage. From ten to 15 pounds per head daily plus hay and some grain are sufficient to keep them in good condition. Pregnant beef cows will eat 30 to 40 pounds of silage per head daily plus some hay.

Swine

Silage is too bulky for swine. However, it may be fed as a conditioner or tonic especially during winter, but hogs will not fatten profitably on it. They waste more of it than they consume. When pasture is unavailable, sows that are suckling litters would benefit by receiving a limited quantity.

This is a good time to plan and even plant some of the hardier garden crops. Thousands of failures were made in garden planting last year and few successes stand out and show wherein all could be patriotic. It is the gardener who counts on his head at this time who will probably succeed.

Madison Cooper, publisher of "The Modern Gladiolus Grower," Calcium, New York, has joined the procession, started by the war conditions, and has increased the price of the "Grower" to \$1.00 per year.

If you can't raise a pig, save one. You can do so by eating less pork.

BREAKING THE HEIFER

The injunction, "let patience have her perfect work," should be obeyed in breaking the heifer to milk. No matter how gentle she may be and how much she may have been handled, she will object to the first manipulation of the udder.

The udder is tender and inflamed from carrying the secretions for several days prior to calving. Then, not being used to being handled in this way, causes her to kick. If she is handled carefully and is not excited during the first three or four days, there is generally no trouble in making her a gentle cow.

If she insists on kicking, a good plan is to nail a board to a pole so that it will extend as far as possible below the pole. When ready to milk place this pole from the manger to the floor so that one end rests on the floor behind the cow. The board will then extend from the pole nearly, if not quite, to the floor, and by standing on the other side of this while milking, the cow can do the milker no harm. After she has kicked the board a time or two, she will become a little more quiet.

The udder should be manipulated with the utmost care while it is inflamed. If care is taken not to unduly irritate it, the heifer will soon learn that the operation is performed to relieve her and she will gladly stand. Patience is the only price to pay and generally a little of it will go a long ways toward successfully breaking the heifer.—Journal of Agriculture.

Cooperative selling organizations lend prestige to the fruit section in which they operate; and a greater confidence is extended to the pack and quality of the fruit put out by such organizations, and their business-like methods, than to the individual grower. In other words, the average purchaser would rather buy the same fruit from a well-organized association than from the individual.

ON THE RIGHT SIDE

"Wonderful mastery you have over these savage animals," said the admiring visitor to the lion tamer. "How do you manage it?"

"Easy enough, sir, if you keep on the right side of them."

"Ah, yes, but what is the right side of them?"

"Well," said the tamer, "I reckon it's the outside."

Comfortable barns keep dairy cows far more cheaply than high priced food.

ARMSTRONG NURSERIES

John S. Armstrong has a reputation for putting out nursery stock which "stands up." It is true to name; it is thrifty stock; and it gives a foundation for fine orchard or ornamental planting. One evidence of the quality of his stock is the quality of the catalogue he issues every year, and the 1918 catalogue is no exception or, if it be, it is that it is even finer than any predecessor. Nearly every page has its illustrations and every page is filled with information for the prospective planter. Those who would plant should write for it to the Armstrong Nurseries, Ontario.

WEATHER CONDITION

# REO

"THE GOLD STANDARD  
OF VALUES"

## This Reo Six Is a Light Six But It Is Also a Sturdy Car

THE TERM "LIGHT" as so frequently used in speaking of motor cars, is a relative term only.

IT MAY MEAN MUCH—or nothing. Depending on whether the reader knows all the factors that enter in.

THIS REO SIX IS LIGHT—just as light as sound engineering will permit.

AND IT MAY SURPRISE YOU to know that—not in the "ads," but on the scales—this Reo Six is as light as many, and actually lighter than some, whose claims to lightness are their chief recommendation.

WE REO FOLK have never talked much about lightness—because that quality in itself is proof of nothing, and yet, as we've said, we make Reos just as light as may be, by the use of the best materials known to the art—as light as may be compatible with the safety factor we desire.

WE LAY MORE STRESS in our advertisements on the staying qualities of the Reo product and the consequent low upkeep.

BECAUSE THAT REALLY COUNTS—those are the qualities the buyer most desires and seeks in the car he buys.

WE DO NOT SACRIFICE endurance for an immediate effect—either in our sales talk or in our designing.

REO ENGINEERING is admittedly sound—it is the standard by which other engineering is compared by those who know.

AND SO WE DESIGN each part of a Reo with an eye single to long time service. Doing that, we automatically obtain low upkeep.

SO, AS WE'VE SAID, this Reo Six is light, using the term relatively—but more important, it is sturdily built.

PUT IT ON THE SCALES—then weigh other cars of similar power and wheel base and size, and you'll agree this is indeed a Light Six.

AND WHILE YOU'RE at it, examine carefully the size of the various parts, especially bearings and the shafts that carry the load and take the driving strains—and you will find other arguments why, at the same price, you should select a Reo Six for yours.

THE SAFETY FACTOR in a Reo is greater than that in any other make of car—save one. And that other is also, in its special class, the world's best car.

STRANGELY ENOUGH, the real proof of "lightness" is not to be found on the scales alone—but in the tire mileage.

SOME CARS are so flimsily made and some others so poorly designed that they are practically dead weight on the tires. Result, excessive tire wear and expense.

ASK ANY REO OWNER of any Reo model about his tire mileage, and his reply will convince you that the Reo is the "Lightest" Six made.

SUPPLY IS LIMITED—we cannot hope to supply all who will want this Reo Six.

SO ONLY WAY is to see your Reo dealer at once, place your order and secure an early delivery date before his limited quota is disposed of.

TODAY won't be a minute too soon.

## Monarch Cultivator

**KILLEFER EFFICIENCY**

The Killefer Monarch Cultivator has more varied uses on the ranch than any other tool we manufacture. As a Beet and Bean Chisel it has no equal. As an Orchard Cultivator, where deep cultivation is desired, it gives perfect satisfaction.

As an Alfalfa Cultivator, when fitted with our Special Alfalfa Tooth, it does excellent work, loosening the ground to a depth of from six to eight inches without injuring the stand. This deep cultivation enables the water to percolate to a greater depth than any other method except subsoiling.

The Killefer Mfg. Co.  
Los Angeles, Cal.

Corvallis, Oregon, April 3, 1916.

Gentlemen: The Monarch Cultivator did us a good job in our alfalfa field taking out a tough grass sod which nearly had the alfalfa whipped out. Am pleased with the performance. We are handling it with a 30 H. P. motor.

Yours, J. B. CORRIE.

## Fig Growers Convention at Fresno

A Largely Attended Meeting Which Will Result in a Marketing Organization, Likewise in More General Production of Figs, of Which the Country Still Imports Thousands of Tons

**H**ENRY MARKARIAN is elected president of the new fig growers' association and the fig growers are determined to back him in the work of upbuilding a greater industry. The fig industry of Asia is paralyzed and California is in a position to meet the world's need. Besides, California can put up a wholesome, attractive food, while food packed by Turks never has

developed the necessity of cooperative effort, through organization, as at the present day. In the great world struggle for military supremacy, who of us can foretell to what extent the application of these fundamentals may determine the result? With the brightest minds and the ablest men of the warring nations devoting their every thought and energy toward the perfection and application of these princi-

spirited business men, realizing the benefits which accrued to the raisin industry through the organization of the California Associated Raisin Company, decided, if possible, to organize the peach growers of the state along similar lines, and thereby save a great industry from irreparable ruin.

Accordingly, a meeting was called for this purpose on August 21st, 1915, at the Fresno Chamber of Commerce building. Preliminary steps were there taken toward the formation of a peach growers' organization, sufficiently capitalized to finance the grower and properly and successfully manufacture and market the product. At this meeting an organization committee was appointed, consisting of William Glass, J. C. Rordan, T. B. McKelvey, J. P. Bolton, I. Teilman and Granville Kimball, their duty, in accordance with resolution passed at this meeting, was to promulgate a plan of organization and call a mass meeting of growers for the purpose of the completion of a cooperative association.

This mass meeting was called for and subsequently held on August 28, 1915, at which were present about 300 growers, all alive to the necessity of the business at hand. The chairman, William Glass, outlined the existing conditions necessitating the calling of the growers together for the purposes of organization. He presented to the meeting the recommendation of the committee that the peach growers incorporate as a stock company, capitalized at \$1,000,000, issuing 25,000 shares of capital stock at a par value of \$40 per share. The committee's recommendation was adopted by this meeting and stock subscriptions were called for, resulting in the pledging of

men for the able and businesslike manner in which they carried on this work, beset with many perplexing problems, to fruition, with no thought of compensation, except the desire to see a great industry placed on a profitable basis.

January, 1916, was the month set for legal incorporation, at which time it was necessary that a subscription to capital stock reach an aggregate of \$250,000. Hard and persistent work was necessary. However, by the set date the necessary amount had been subscribed and a mass meeting of growers was called for January 12, 1916, to be held at the Auditorium, Fresno. This meeting was attended by representative peach growers from every section of California where acreage had been signed and stock subscribed. Twenty-five trustees were elected, representing these several sections.

Legal incorporation of the California Peach Growers was effected, and William Glass was the unanimous choice as the first president of this association.

The work of securing further stock subscriptions and crop contracts was prosecuted with renewed vigor, resulting in obtaining, by August 1, 1916, less than one year from the inception of this movement, crop contracts covering 45,000 acres of bearing peach trees, and capital stock subscriptions totaling \$850,000, the latter in the aggregate representing 6,000 stockholders, 5,700 of which were actual growers. Though to some it might seem these figures could hardly be attainable in so short a time and from all parts of the state, they evidenced the fact that the growers themselves

The Maslin Fig Orchard at Loomis

A scene taken by the Cultivator camera some time ago. This orchard has some remarkably fine types of figs which are being made the foundations of orchards.

been particularly appetizing. There were fig growers from all parts of Central California and they said "we will organize and the new association shall be California Fig Growers' Association."

No single voice was raised against organizing and thousands of acres have already signed up. Central offices will be established at once in Fresno which will be under the general supervision of nine directors. The first assessment was merely nominal, that of 10 cents per acre and to bear the expense of organization.

The committee on organization consists of E. Newbby, F. W. Yokum, Henry Markarian, E. W. Sheridan, W. S. Clarke, J. S. Douglas, Robert McHenry and J. H. Sampson. Of the purposes of the organization we will speak more at length in a later issue.

One of the inspiring addresses which aided in leading up to the organization, was the address of Frank Wilson, head of the Peach Growers' Association. We give Mr. Wilson's address practically entire:

**T**HE Benefits of Cooperation, Organization and Standardization," when taken in its entirety, covers an exceptionally wide scope, and the dove-tailing of the whole into the workings of a cooperative organization is necessary to insure positive success.

This subject is today commanding the attention, not alone of the producing classes of California, but of the great nations of the world, who realize the absolute necessity of cooperation, organization and standardization, that the goal of "Efficiency" may be reached. Perhaps at no time in the history of the world has there de-

veloped the necessity of cooperative effort, through organization, as at the present day. In the great world struggle for military supremacy, who of us can foretell to what extent the application of these fundamentals may determine the result? With the brightest minds and the ablest men of the warring nations devoting their every thought and energy toward the perfection and application of these principles, with efficiency as their ultimate goal, should any of us question the wisdom of applying these methods in the growing and marketing of our products? To the skeptical, we have but to refer to the success made by our local organization, the California Associated Raisin Company. The California Peach Growers and the several kindred associations of producers throughout the state are as well concrete examples of achievement along these lines.

Being an official of the California Peach Growers and quite an extensive grower of peaches, I feel in a position to be able to present to you a short resume of the history and work of this grower's organization in the placing of the peach industry of the entire state upon a firm and sound foundation.

The adage, "Necessity is the mother of invention," was truly applicable and fitting in the case of the California peach grower. For several years prior to organization the industry was in a most deplorable condition, especially with reference to the freestone varieties. Farmers, unfortunately burdened at that time with a freestone peach orchard, were compelled to dispose of their cured crop to speculative operators at a net loss of about \$40 per ton. Because of this condition, the fruit was grown, picked and cured, if at all, in a desultory manner, was inferior in quality and decidedly unpopular with the trade, in fact everybody had a knock at the peach.

The awakening, the dawn of a new era, for the peach industry was ushered in when some of our most enterprising growers and a few public

Drying Figs in California

This drying scene is in the yards of the Kearney Estate now the property of California University. California is now shipping thousands of tons of high quality cured figs. The demand is for still more.

\$30,000 in subscriptions to the capital stock before adjournment was taken. William Glass was elected chairman of the organization committee and the initial and subsequent work attendant to the formation and organization of the California Peach Growers was prosecuted by the gentlemen comprising this committee with characteristic determination. A debt of lasting gratitude is due these gentle-

men for the able and businesslike manner in which they carried on this work, beset with many perplexing problems, to fruition, with no thought of compensation, except the desire to see a great industry placed on a profitable basis.

Success or failure at this juncture lay largely with the management, who, I assure you, fully appreciated the responsibilities and difficulties yet confronting them before the industry

Continued on Page 38

## Olives in the Antipodes

Australia is Picking up the Olive Industry. Comparisons of Its Output with Other Sections of the World.

CALIFORNIA is, we have sometimes thought, a fairly extensive producer of olives, but from the Australian standpoint we are left out, even from the "also present" list. We note an article in "The Fruit World" of Australasia in which Mr. Beaumont, manager of the government orchards at Blackwood, South Australia, treats of olive production in that section. In introducing his subject he refers to Italy with its 4,000,000 acres planted to olives and other countries with fairly extensive plantation, but makes no mention of California as a producer. South Australia is the principal producing state of Australia, yet it is growing only about one acre for every 100 California is growing.

However, there are some most interesting points in Mr. Beaumont's article as to conditions and methods in Australia. In proof that South Australia is still pioneering note that the writer mentions the fact that there are some 45 varieties. Commercially, California has reduced the great number she grew at one time to three or four, in fact, practically to one variety. The Mission is a long favorite, with Manzanillo a tardy second, and the Ascolano or other large varieties fill the demand for the mammoths.

From Mr. Beaumont's article we give the following:

The principal producers of the olive today are Italy, Spain, Algeria, Greece and Turkey. Italy has over 4,000,000 acres, and Turkey has over 1,000,000 acres, while South Australia has about 1,000 acres. South Australia grows more olives than all the other states of the commonwealth combined, so that as far as Australia is concerned the olive industry is in a very small way indeed.

From my own experience I should say that a large percentage of the olives of South Australia are seedlings. The olive is the same as most of deciduous fruits in that the seed does not come true to the parent stock, but is more or less worthless—in fact, it has been demonstrated that only about one-half per cent of seedling olives have any commercial value.

The originals of our best types of trees were probably selected seedlings, but the better methods of getting desirable varieties are by grafting or budding or by layers or by cuttings, of which there are two parts used—the soft tips and the hard wood of the bigger branches, generally known as truncheons. Budding may be done any time when the sap is flowing freely, and either a single bud or a twig with several buds may be used in the ordinary way, and the new growth must be cared for as attentively as is necessary in other fruits. Budding the olive is not so easily done as other fruits; the bark does not lift so readily and does not heal quickly, hence budding is not often carried out.

In like manner and for the same reason grafting is not very successful, though in certain cases well worth trying—that is where there are well-grown trees which do not bear, or else bear fruit of an inferior quality, and in such a case I would advise grafting only a section of the tree in one season.

Most of the olive trees are raised from cuttings. Layering is more certain, but is too costly and takes too long. The planting of cuttings of the soft tips seems to be coming more and

more into favor, and is simple and fairly effective; the cuttings go into small space, and are planted much as we do the vine cuttings.

As a general rule the tops of growing shoots are cut off about four inches in length, just when the wood is passing from the soft state to the fibrous. The tips should be cut just below a node, and the lower pair of leaves should be removed. They should be planted in a shady spot—a shadehouse is best—in fine sandy soil, and be kept constantly moist. When the roots start, transplant into small pots, and from them into their position in the grove when about one year old. To root ten per cent of these cuttings must be considered a fair return. There is no doubt but that the truncheons are the best if they can be procured. These truncheons should be made in winter, and may be from one inch to three inches in diameter. Remove any of the twigs and cut into lengths of about 15 inches; the actual cutting may be done with a sharp axe on a solid block, care being taken not to split or to splinter the ends. There are several ways of dealing with these truncheons. By some growers they are tied into bundles and buried in horizontal position about one foot deep in damp soil, but it must be well drained; then in early spring they are planted in rows in a slanting position, with one end three inches out of the soil. The soil is then ridged up so as to cover the ends.

The olive will grow practically everywhere; of course it will thrive best in a good rich, free soil, with clay under, but with variation of treatment it will do well under almost any circumstances—for instance, they are now planted in some of the most arid parts of America, and I have seen olives in parts of Australia where it was almost impossible to grow anything else.

The pruning of the olive is carried out at first, as is usual with other trees, namely, to obtain a good base or form or shape, as you may desire to call it. The tree should not be permitted to become dense and bushy.

The olive bears upon the wood which grew the preceding year, and upon no other, therefore to encourage the growth of new twigs along the heavier limbs must be the pruner's endeavor, but care must be taken not to allow a dense growth, as any tree which has not a free circulation of light and air cannot bear fruit. At the same time care should be taken in thinning out a tree not to expose the bigger limbs to the direct rays of the sun; if you do the bark will burn, and the limb will die.

As far as disease goes, the olive is a very hardy tree, and is not easily injured, but its greatest scourge is the olive scale, which undoubtedly spoils the beauty and usefulness of the tree, but it is easily dealt with, and I think it is to be regretted that trees, even within the parks of Adelaide, are allowed to go uncared for, and thus to spread the trouble far and wide. On the secretions from the olive scale, the "sooty fungus" which we are all so familiar with, exists. Unfortunately this scale and the fungus frequently attack other fruits and flowering shrubs. An occasional spraying with kerosene soap wash will clean the trees effectively.

The curculio beetle is fond of the olive, but it may be checked with

—like snow shoes  
on the snow—

**SIEVE-GRIP** wheels  
give support and traction  
on plowed ground

NOTHING has been made for carrying a man over soft snow better than the snow shoe. The light weight mesh and broad surface, enables a man to travel over snow—the snow shoe gives traction and SUPPORT.

Just so is the action of Sieve-Grip Wheels on soft, plowed ground. The angular grips of the skeleton tread act just like the cross-woven thongs of the snow shoe. The principal of construction and results of both are the same, yet the material is different.

The Sieve-Grip Wheel is one solid piece of steel—no parts to loosen or wear out—gives the Tractor ample support—does not pack—It CULTIVATES; and is only one of the features that make for the superiority of

## TEAGUE QUALITY CITRUS TREES

AWARDED THE GOLD MEDAL AT FOUR INTERNATIONAL EXPOSITIONS.

For Productive values, fine quality of fruit and vigorous growth Teague's bud-selected, (pedigreed) properly trained and carefully handled orange and lemon, pomelo and lime trees are the trees to plant. An experience covering a third of a century warrants the assertion that Teague Quality Citrus Trees possess these qualifications in a superlative degree. All the standard commercial sorts, and garden and ornamental varieties; the largest assortment of citrus trees in America. . . . We invite correspondence from intending planters. . . . Consultations on citrus planting by appointment. 1918 Price list just out; send for a copy.

**The R. M. Teague  
Citrus Nurseries**

Box 67, SAN DIMAS  
CALIFORNIA

FOUNDED IN 1889  
AT IT 29 YEARS

arsenate of lead, one pound to five or ten gallons of water.

And now a little about the produce. It seems passing strange that though everyone is agreed that only certain varieties of apples, pears, plums and other fruits are of commercial use, they think that any old olive is quite all right. They have not gripped the fact that only a few varieties of the olive are worth planting. We have 45 varieties at Blackwood, but it remains to be seen how many are of value. It is not necessary to go into the question of the picking of the fruits; machines have been tried, but a man who means business is the best when it comes to picking olives. One firm in Adelaide has over 100 adults picking olives this year; that in itself is enough to show that it is profitable. I would sooner pick olives than cherries any day.

The price, at 13.6 per hundred, should pay handsomely if you have good trees, well cared for. The main product of the olive is olive oil, and it is beyond the scope of the present paper to go into the details and mysteries of its production. One ton of olives should yield 35 gallons to 45 gallons of oil. A grove of 14 acres of trees, now 30 years old, has averaged 450 hundred pounds of olives per acre for 20 years, the annual yield varying of course with the seasons. Simply let me tell you that the olives are crushed thoroughly so as to free all the oil contained, the crushed product is placed in mats of esparto grass, and subjected to pressure, say about 300 pounds. The mass is then broken up, and warm water added, and is again pressed, perhaps three or four times, and up to a pressure of 1,000 pounds. The oil and water are separated as soon as possible after being released, and the oil is either filtered or allowed to settle, according to the method adopted at the various factories.

Our consumption of oil is at present about 60,000 gallons, and we produce about 14,000 gallons, so there is room for improvement, and when we allow for the further fact that we import about 300,000 gallons of cheap cotton seed and colza oil, we will find even a greater reason for extending the culture of the olive. Then there is the preparation of the ripe olive as a food, and the green olive as an appetizer. Here again is great scope for enterprise. Olive oil is a powerful food, and is a splendid substitute for animal fat, and has practically no waste. There is nothing better for the frying of foods. It is a fine preservative; we are all acquainted with its use in tinning fish, etc.

As a medicine it is most useful, either internally or externally; it will heal cuts and prevent chapping; it is a true remedy for constipation; it is of great assistance to anaemic people in forming new blood, and has been strongly recommended as a food to persons suffering from diabetes, who are not able to assimilate starchy foods; in fact, olive oil and ripe olives are invaluable, though little understood adjuncts to health, and when the price charged is reduced to something within reason, there is no doubt they will come into general use.

#### FROST PROTECTION FOR OLIVES

**D**ISCUSSING frost protection for olives, the Olive Journal says:

When it comes to considering protective methods in the case of frost, we have conflicting opinions as to the results that follow such methods. We have been

## Why This Oakland Wins Wide Favor

**I**T is no accident, nor mere caprice of opinion, that has given the Oakland Sensible Six its high place in the regard of the American farmer.

It is, rather, that this car more ably meets his wishes and his needs than any other, and better serves him at a lower upkeep cost.

Although built on an extraordinarily strong and serviceable chassis it carries no unnecessary weight, and its high-powered engine is free from handicap of any sort.

Its slightly and comfortable body is swung on long springs over a generous wheelbase—on the roughest roads the car travels with sureness and ease.

The high-speed overhead-

valve engine of the Oakland Sensible Six is simple and efficient; at 2600 r. p. m. it delivers 44 horsepower, or one horsepower to every 52 pounds of car weight.

It is quick, capable and positive in action; under all conditions it is exceedingly sparing of fuel.

The body of the car is handsome in line and proportion; it is carefully made, very roomy and exceptionally comfortable.

Concentration of the entire Oakland manufacturing forces upon one chassis as the foundation for several body models has resulted in a value not equaled in the present car market.

assured by some that the use of crude oil, as used ordinarily in orchard heating of other fruits, is injurious to olives for pickling or the making of oil. On the other hand, we have been given equal assurance that no such injury results. We have eaten processed olives that were said by the packer, who also grew them, to have been subjected to not less than six "smudgings" with crude oil, and we found them no different in taste from olives not thus treated. But we cannot settle his question by any proof that we have at hand, and nothing less than a series of careful experiments made in orchard and processing plant, under rigid conditions of impartiality, will be sufficient to demonstrate the point so that the industry may know once and for all which of these two opposing views is sound. We incline strongly, ourselves, to the view that olives can be saved from frost as other fruits are saved, and that by the use of crude oil in orchard heating, and we feel this way about it because we have no proof before us that oil heating does injure olives for processing. If any packer or grower is possessed of indisputable proof that olives have thus been rendered unfit for pickling, it will be our duty to promptly change our views and to give as wide publicity as we can to the facts.

In the meantime it is planned to carry out some exhaustive tests along this line in both grove and plant this coming season, and the results will be carefully watched.

### FIG GROWERS' CONVENTION

Continued from Page 35

could be placed upon a sound and profitable basis.

By the terms of the grower's contract the association was obligated to receive and grade all deliveries, paying the growers, on a graded basis, a minimum of \$100 per ton on No. 1 fruit. Of this amount, 70 per cent was to be met by cash on delivery, the remaining 30 per cent, optional with the association, could be covered by cash or interest-bearing notes.

I shall not attempt here to recount the difficulties encountered, and surmounted, during the first year of the existence of the California Peach Growers. Rather I would express appreciation and thanks for the loyalty displayed by the growers, and the confidence shown by the banking institutions of the state, who, with scarcely an exception, extended every courtesy within their power.

I am pleased to report the growers received in final settlement on 1916 crop an excess of nearly one-half cent per pound over the guarantee; a seven per cent dividend on the capital stock was declared and a reserve of \$20,000 set aside for emergency.

The California Peach Growers received and marketed, during its first season's operation, in round figures, 24,000 tons of dried peaches, this in the face of a carry-over from 1915 of an amount variously estimated at from eight to 12 thousand tons. This crop was marketed at a price returning a profit to the grower and a saving to the peach industry of at least one and one-half millions of dollars.

Furthermore, during their short life the California Peach Growers had succeeded in building up their own manufacturing and marketing machinery and had acquired all rights to a patent, which has been applied for, on a dried peach peeling device, which is of inestimable value to the industry and through which, together with a thorough system in the standardiza-

tion of grading and packing, this association will establish an asset in the reputation of its brands, that its output will be sought after and for which the trade will pay a premium.

Summarizing, we find through cooperation and organization a few of the distinctive accomplishments of this one industry made in one short year, such as:

The elimination of excessive speculation, through financing the grower, and the marketing of his products.

A saving to the industry of a million and a half dollars per annum.

The establishment of a system whereby the grower receives payment, based on graded quality of fruit delivered.

The acquiring for the association a United States patent on a peeling and re-cleaning device, which is worth millions to the industry by the placing upon the market of a sanitary and wholesome food product.

And last but not least, the preservation of land values and home comforts.

These advantages, and many more, have been accomplished for this one industry through the medium of cooperation, organization and standardization. Many like associations have had similar experiences.

The cooperative spirit, as applied to agricultural efforts, is gaining favor, in fact becoming particularly popular

## Now's the Time

to get in your dormant or winter spraying. If done properly—this will prevent the accumulation of certain insect and fungus enemies; will clean your trees and soften the bark; and will keep the trees in better health, vigor and fruitfulness. For this purpose there is nothing so effective as

## Crude Oil Emulsion

Remember—Universal Orchard Sprays are made by us from the finest materials, under expert supervision. They are quick and sure. And—they penetrate.

Among the other sprays manufactured or distributed by us are:

Dormant Soluble Oil  
Bordeaux Mixture  
"Triumph" for Citrus Trees  
Lime Sulphur Solution  
Arsenate of Lead  
Miscible Oil No. 1 for Olives  
Miscible Oil No. 2 for Thrips

Order now—don't wait until your trees are laden with deadly insects.

Never hesitate to write our Service Department—in charge of Paul R. Jones, Expert Entomologist. His advice is dependable—and it's yours free.

Insecticide Department

Los Angeles

In California. Growers' cooperative concerns are now looked upon with favor in the great trade centers of the United States. As a standardizer of quality and a stabilizer of price, it has the confidence of the present channels of trade, the broker, the wholesaler, the jobber and the consumer.

One important thought in connection with a contemplated movement of this nature is whether it is wise to operate a stock corporation, with sufficient capital to finance the grower, or to simply incorporate as a cooperative concern without capital, as some of our most successful associations are doing today.

I am convinced that there is a distinct advantage through the employment of the former method as the great percentage of growers generally need ready money during the harvest season, and only an association with capital can secure to the grower this accommodation.

It is an historical fact that many of the failures in cooperative effort are directly traceable to the absence of capital with which to finance the grower at a time of need.

I would strongly recommend that growers' associations confine their memberships exclusively to growers actually producing the particular commodity handled by that certain association.

While we are, in spirit and in truth, a cooperative concern, we are in the unique position of appearing as a stock company, capitalized and operating for the benefit of our stockholders, while in effect all profits of our association revert to our grower members. By confining our membership to grower stockholders exclusively, we are not subjected to a false interpretation of manipulating for profit.

However, there is, to my mind, one basic principle that underlies and envelops the entire structure of any business concern and which is especially applicable to cooperative associations—confidence. This supreme attribute cannot be acquired by capital alone, but rather through a strict adherence to business integrity, honesty of purpose and square dealing.

Only when complete confidence is established with the grower, the financier, the trade and the consumer can the success, success that means all the word implies, be attained.

In conclusion, I wish to say it is my honest conviction that cooperative organization, composed of and for the farming classes of California, is the best safeguard known today for the insuring of positive and continued profits on the millions of dollars invested in agricultural pursuits.

The theme is right in principle, and under careful and unbiased management, skilled in the arts of competitive business, is right in practice.

When such an organization is formed and managed along the lines previously mentioned it fraternizes the members, in fact, is an industrial democracy.

There are many lines of agriculture still under the spell of gamblers in produce. Let us hope that many of these will eventually harken to the cry of cooperation, the application of which will mean positive prosperity to the producing classes adopting its protection.

Few gardens are made rich enough to grow vegetables well. Unless they are pushed rapidly to maturity much of the fine flavor and crispness is lost. This does not mean forcing them by artificial means, because in that case, too, they lack flavor. A healthy, normal growth is to be desired.

### THE MISSION FIG

From J. W. Mills' Paper Read at Fresno Fig Meeting

WICKSON in his California Fruits says: "The fig is, perhaps, the grandest fruit tree of California. Its majestic size and its symmetry

make it a crowning feature of the landscape, and its dense foliage renders the wide space embowered by it a harbor of refuge from midsummer heat, both for idlers and the industrious. On adjacent farms in Pleasant Valley in Solano County there are large fig groves; one serves as a shelter for the packers of fruit from the contiguous orchard and the other encloses and shades a croquet ground." Wickson also records the measurements of several large Mission fig trees growing in California. At Knight's Ferry in Stanislaus County there is a Mission fig tree 60 feet in height whose branches cover a circle 70 feet in diameter. At the same place is a grove with the trees set 60 feet apart, yet the branches intermingle and form a dense shade.

Generally speaking, the local popu-

larity of the Mission fig predominates over that of other varieties. This is because it is so much more widely grown and common than other varieties and not because it is possessed of any superior qualities. In the markets outside of California it will never supplant the Smyrna or Callmyrna. The latter has become established for more than a generation in the Eastern markets and besides the quality and appearance are far superior to that of the Mission fig. Were the quality and appearance of the Mission fig superior to any other it would have had the lead in the markets of the world before now.

Within the last few years the Mission fig has proved to be a reliable money maker, but previous to this time there was doubt in the minds of many growers as to the advisability of planting it on a commercial scale. The dark color of the dried fruit and the sugar coating which develops soon after packing make it unattractive for the Eastern consumer, who usually mistakes the sugar for mold. In spite of this, the market has strengthened for this variety, and of

late years prices have been good, with a consequent increase in planting. The Mission is a lazy man's fig. After the orchard is once established he need not go near it except to pick up the dried fruit at harvest time and sack it.

The large size to which the Mission fig tree grows necessitates wide planting. No nut tree or other fruit tree requires so much space as this variety of fig. Even though the branches do not touch in old bearing orchards, unless plenty of moisture is present in a loose deep soil, the fruit will be small and the trees will show signs of distress. Several orchards in Solano and Yolo Counties testify to this fact. Never plant closer than 48 to 50 feet. Intercropping can well be resorted to in the young fig orchard with no injury to the trees.

Two-year-old trees are better than one-year-old. The roots that grow on the bottom of a fig cutting the first year are very tender, and careless digging or handling after digging will break the bark at the point where it joins the cutting, rendering it worse

Continued on Page 43

## You Want Quality Fruits Quickly

Everybody who plants fruit trees—whether for home orchard or commercial purposes—is after the SAME results:—Quick bearing; Quality fruit and Quantity yield with regularity. These are the three cues to orchard success.

### Both Roots and Bodies of Stark City Trees are Specially Trained for These Results

Stark City roots are developed extra large and heavy, by scientific methods, aided by an ideal climate and a rare soil of highland limestone and grit formation. These heavy, wide-spreading roots have a great store of vitality, which enables the newly transplanted tree to establish itself quickly and make rapid and continuous growth.

Stark City trees are specially trained from the start, so that you won't lose any time in reshaping the tops. The buds on the main trunks and branches are strong and healthy and can be depended upon to start thrifty shoots.

All Stark City Trees —to reach you in prime condition.  
are GUARANTEED —to be absolutely true to name.  
—to live and make satisfactory growth.

We sell direct from the Nursery. No agents or other middlemen represent us. This insures you the genuine, original Stark City trees and gives you the first hand responsibility of the Nursery.

What Growers Say About Stark City Trees: "You are surely experts in wrapping trees for shipment. Have never seen trees with such perfect root systems and so securely packed."—J. M. Hoyrup, Utah.

"We will never get trees from any other nursery."—C. P. Albright, Arizona.

"The picture enclosed shows the tremendous growth our one year old J. H. Hale trees have made. The fruit is superb; holds its quality twice as long as any peach I know. It would go to Europe from California."—Parker Earle, Director Redland Heights Ranch Company.

"Your trees are the hardiest, best rooted stock we receive, well packed, and in good condition."—H. B. M. Hall, California.

## The Nutritive Value of Dried Fruit

Prof. M. E. Jaffa of Our State University Tells Why We Should Eat More Dried Fruit

**D**RIED fruits should be eaten in much larger quantities than at present.

We must remember that there are two chief objects of foods—to build and repair tissues, and to yield energy.

Can dried fruit build and repair tissue? Can dried fruit yield energy? The answer to both these questions is, "Yes." The dried fruits, however, can not build to any appreciable extent either muscular tissue or bony tissue; it builds fatty tissues.

The chemical analyses of dried fruits, flour, and bread, as determined from a number of samples, show them to have the following composition:

These data show us conclusively that the chief nutritive element in the dried fruits generally is sugar, one of the most valuable of the carbohydrates, and certainly most easily digested and assimilated of all. When we consider that the consensus of opinion among physiologists and nutrition investigators is that the carbohydrates of our food, and not the nitrogenous compounds, are the source of muscular energy for the body, we can better appreciate the high nutritive value of dried fruits. The average amount of carbohydrates, mainly sugar, in the dried fruits is about 62

per cent, while the average amount of carbohydrates, mainly starch, in flour is 75 per cent. In other words, the carbohydrate element in the dried fruits is not very much below that noted for flour. If we refer these data to the grain itself, then the carbohydrate content of the dried fruits very closely approaches that of the grain.

The value of fruits and vegetables also in the diet is further emphasized when the mineral ingredients of foods are considered. These for convenience and brevity may be divided into base-forming and acid-forming elements. Those contributing to the former are potash, soda, lime, magnesia, etc.—to the latter, sulphur, phosphorus, chlorin, etc. In meat and eggs we have an excess of the acid-forming elements. The grain by-products indicate sometimes a balance or a slight predominance of acid-forming elements, and the more refined the product the greater is the excess. In milk the balance is in favor of the bases. Vegetables and fruit contain a large excess of base-forming elements. These statements indicate very

strongly the desirability of having in the diet a generous proportion of fruits. A diet consisting only of cereals, meat and eggs in which therefore the acid-forming elements would greatly predominate would result in bringing about disturbances of metabolism.

Another way of comparing the total food value of one food with another is by means of the caloric or unit of energy. An inspection of the figures giving the caloric values of the foods above listed, indicates that flour possesses the highest fuel value, due to the fact that it contains much less water than do any of the other food products mentioned in the table. At the same time one quite often meets with dried fruits containing no more than 15 per cent of water, in which case there is very little difference between the total value of the fruit and the flour, particularly in view of the fact that "our frequently contains upwards of 12.5 per cent of moisture. The caloric value of white bread, as ordinarily made, is 1,270 calories per pound as shown by the above data.

The comparison, however, of the chemical composition alone does not give one always the true physiological or nutritive value of a food. While it is true that flour possesses the higher total food value, when compared with the ordinary dried fruits, still a combination of the two is far better than either alone.

In using dried fruits we obtain not only the nutritive value of the sugar, but whatever other hygienic or medicinal value they have by virtue of the salts and organic acids found in fruits and also in vegetables.

The craving for sweets, exhibited in most children and many adults, is a natural demand on the part of the system for a needed food. This truth is brought home to us more clearly when we remember that nature's food for the infant, mother's milk, contains, of its solids, 50 per cent sugar. Nature continues to provide sugar for the older children in the form of sweet fruits. But it must be borne in mind that after we have outgrown the milk, all the necessary ingredients in the proper proportion are not found in any one food as they are in milk. It is therefore left to the instinct, judgment and wisdom of man to provide for himself with the different foods and to combine them for himself into a perfect whole. If he ignores one class and over-eats of another he is usually punished for his mistake.

Whether it is instinct or knowledge that led man to combine nuts and dried fruits, it matters not—the result is a happy one. The nuts furnish what the dried fruits do not—nitrogen and fat. If these two foods are used with bread or crackers, or other flour preparation which would supply starch and bulk, we have a well-balanced meal.

### SWEET SOIL

A fertile soil must be sweet, not acid, and well supplied with organic matter and humus. It must have a suitable texture and tilth—a favorable environment for the plant roots. The necessary bacteria which have to do with soil activities must be present and conditions favorable for their growth and multiplication. The soil must be properly aerated and have a sufficient supply of soil moisture, which includes proper tillage, irrigation and drainage. All of these factors and others must be associated in a careful systematic plan of soil management in order that the land may be fertile and produce large crops.

Titan  
10-20

**T**HE tractor is a real help to American farmers now. It is fast taking over all the heavy farm power work.

Kerosene is the best, as it certainly is the cheapest, tractor fuel. Therefore, all our tractors, **International, Mogul** and **Titan**, are designed, built, and guaranteed to operate successfully on this cheap, plentiful fuel.

We pay particular attention to these three essential features: that our tractors shall operate on the cheapest fuel farmers can buy; that they shall be so simple that any farmer can learn to handle them; and that they shall do enough good work in the field and at the belt to more than pay for themselves.

Mogul  
10-20

On this basis we solicit your orders for **Mogul 10-20, Titan 10-20** and **International 15-30** kerosene tractors.

It will be difficult for us to furnish your tractor as soon as you want it. The demand is hard to keep up with and shipping facilities are very much handicapped. Send for our catalogues now, make your decision, and send in your order as soon as you can if you want an International Harvester guaranteed kerosene tractor in time for the spring plowing.

International  
15-30

## Guard Against Bee Diseases

**I**N THE present effort to meet the demand for sweets there are many who are buying a stand or a few stands of bees who have little knowledge of some of the requirements of bee keeping. Above all, these beginners should be aware of the fact that serious injury may be done to their own bees, and even to the welfare of the industry of the state, by ignorance of diseases which may affect their brood. A specialist of the U. S. D. A., now in California, has given warning on this point. He says:

"One of the most serious factors mitigating against large production is bee disease, and a constant danger to the industry is the careless amateur bee man who does not give his stands the necessary attention and allows foul brood to develop unchecked by weakening his stand. His bees are not able to hold their own against attack of those of his neighbors, and these busy insects will come from even a mile or two to rob the weaker stand, and in this way the bees carry with them the foul brood infection and the disease is rapidly spread.

"Foul brood is a bacterial disease of bees which attacks the insects in the larval and the pupal stages. There are two forms of foul brood, the American and European. It may be difficult for the amateur to distinguish between these, but the more common method is to puncture the cells with a toothpick and attempt to draw out the pus residue. The American foul brood will string out like glue for three-quarters of an inch to an inch and a half, while the European foul brood will string out but little. Later in the season when the residue of the cell has dried out it is rather simple to distinguish between the two forms of the disease. In case of the European foul brood the remaining scale can be easily separated from the cell wall and removed with a toothpick. In case of the American foul brood the scale sticks tightly to the cell wall and cannot be removed without taking with it a portion of the cell.

"The stand should be frequently examined and as soon as infection is noted measures should be taken to check the disease. In case of the European foul brood the control is comparatively simple. It is only necessary to shut off the queen from the infected part of the stand and the worker bees will clean out the comb and in the process of digesting the honey within the body of the bee the bacterial infection is killed. A common method in accomplishing this purpose is to confine the queen to a clean box below, placing the infected box as a super. Between these a queen eliminator is used, it being a simple frame with parallel wires stretched across close enough together to permit the workers to pass through and prevent the larger queen from passing. The worker bees will then clean out the "super," later filling up the cells with honey.

"In case of the American foul brood, the infected stand should be moved back a few feet and a new one placed where it had been. By taking out the frames from the infected stand and shaking them in front of the new stand the bees will enter their new home. The frames should then be removed from the infected stand and boiled up or burned."

### DON'T OVERSTOCK

The Yolo County farm bureau is doing some live wire work as a war measure. At a recent meeting at Willow Oak Park E. F. Atwater, field agent in bee keeping for the U. S. D. A., cautioned in particular against the

overstocking of the range, there being a tendency when one farmer is making a good profit from his bees for his neighbor to become enthusiastic and go into the game also. This may result in the presence of too many bees in that immediate neighborhood, which will cut down on production of honey in all of the yards.

Another important thing is not to rob the bees of more honey than they can well spare. By leaving an abundance of honey for the insects to feed on they will come out in the spring in much better shape to produce heavily during the blooming period.

When we stop to think that a vigorous stand of bees will produce from four to 20 pounds of honey per day, the importance of great care in maintaining the vigor of the stand is obvious.

### BUYING TRACTORS

Some months ago we commented on the state of New York entering into the producing more campaign in a most practical way through the purchase of a number of tractors which were put into immediate use on almost any terms to suit the farmer, either by rental, purchase or otherwise. The state of Maryland has now purchased tractors, putting them into the field to work. This is a labor-saving measure.

Charges for the use of the tractors are based on the absolute cost of operation. These charges range from \$2.50 to \$3 an acre for plowing and 50 cents an acre for harrowing or disking. The results thus far have proven entirely satisfactory. Plans are already under way to continue the use of the tractors in the preparation of land for spring crops.

Even in the far off Philippines the

ravages of rinderpest have so depleted the carabao that a serious "labor situation" is threatened there. Tractors are extremely high in price, but are being purchased by the larger planters, and even cooperative purchases by smaller land owners have been made.

### FOURTEEN CHEMICALS

Fourteen chemical elements enter into the composition of all plants—calcium, carbon, chlorine, hydrogen, iron, magnesium, manganese, nitrogen, oxygen, phosphorus, potassium, silicon, sodium, and sulphur. Only four of these are of prime agricultural importance, namely, nitrogen, phosphorus, potassium and calcium, because these elements are not only very necessary for plant growth but they are most likely to become deficient and need to be supplied in order to maintain soil fertility and a profitable production of crops.

**"I'll Guarantee This Spreader to Pay for Itself in One Year."**

*B. C. Oppenheim*

I've been in the spreader business so long that I know what I'm talking about. Take my word for it, when I signed that guarantee I knew I was taking no chances.

Here! Take your pencil and let me prove it.

Suppose, for argument's sake, that you keep but six cows, 4 horses and a few hogs or sheep. They will make—according to Cornell Experiment Station reports—approximately 120 tons of manure per year. When these reports were made the chemical value of fresh manure figured out \$3.31 per ton, and piled or stored manure at \$2.55 or less, depending on the length of time it has lain. Nobody knows what the potash and nitrate are worth now at war time prices. Anyway, fresh manure is worth at least three-fourths of a dollar more than old; and when you add the hard extra labor involved in hauling, piling and hand spreading, it's safe to make the figure *twice* that. Many other Experiment Stations and the U. S. Department of Agriculture support these figures, and some make them even higher.

Now you can see from this why, on any farm of 80 acres or more, I am willing to put my reputation squarely behind the above remarkable guarantee on the

# NISCO

## The Original Wide Spreading Spreader

A farm implement which pays for itself in one year is a 100% dividend payer ever afterwards—a fact that thousands of successful farmers have learned concerning the Nisco. Why shouldn't you get this dividend?

The Nisco was the *first* spreader to embody the wide-spread idea and maintains this supremacy to this day. It operates with an everlasting chain sprocket wheel drive that minimizes breakage and saves wear. Has a tight bottom and an endless chain conveyor that brings all the load to the two beaters. Handles a load 30 inches high as readily as any other does an even box full. A convenient lever allows spreading any quantity desired—3, 6, 9, 12 or 15 loads per acre. Back of the money-making Nisco Spreader

See the machine at the Nisco dealer's. If you don't know him, we will send you his name.

## Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Warbles or Grubs in Back

Have cow which had lumps on back. Lumps grew larger until, upon examination, a small hole could be seen. When the lumps were squeezed bugs appeared, looking exactly like a peach borer. Are they maggots? How can they be gotten rid of? — Subscriber, Los Altos.

These are the grubs of the warble fly which should be forced out and killed. A better way would have been to have taken, earlier in the season, when they are smaller, making a small cut, when they may be pressed out at the earlier stage. They are most annoying to cattle and cause serious loss. Fifty million dollars per year is the estimated loss in the United States. Be sure and crush the grubs which are removed. Make examinations at least every two weeks at this season of the year, for more of the lumps. Some have treated by using ordinary oil can filled with kerosene. This is inserted in the small opening, but this is not so satisfactory as the treatment of forcing grubs out through the opening, or if necessary, cut. During the summer, fly repellants may prevent to a smaller degree, attacks of the fly. Arsenical dips for cattle, used to destroy the Texas tick, also destroys vast numbers of the newly hatched larvae before they secure entrance.

### Employers' Liability Insurance

Have small grocery. Wish to employ delivery boy for four weeks. Have been told insurance rate would be the same as for a year. Is this true and can I not get cheaper rate for the four weeks?—Subscriber, Long Beach.

The best information on the subject may be secured by writing directly to the Industrial Accident Commission, Union League Building, Los Angeles, or address them at San Francisco.

However, may say that the minimum in this case will be \$10 and the insurance will cover any employment for similar purposes during the year. The rate depends, in this case, upon the method of delivery. If it be by foot, or bicycle, the rate is nominal. If by auto, much higher and if by horse and wagon, still higher.

### Size of Eggs

We have some White Leghorn pullets hatched last March which started to lay in September. They have layed well since, but the eggs are still smaller than usual. Would like to know cause of this. — Subscriber, Hemet.

Size of eggs is a matter of breed or breeding or both. As a rule the larger a hen is the larger egg she lays, but Minorcas are a notable exception to this rule. Many strains of Leghorns lay a rather small egg, and often individual hens are found in large-egg breeds like the Orpington and Brahma which lay a comparatively small egg. Probably your pullets belong to a small-egg strain, but the eggs may increase in size in the spring. The only way to increase size of eggs in a flock is to use the largest eggs for hatching. If your eggs are all small, buy hatching eggs from some strain that lays a larger egg.—J. A. K.

### Ashes from Straw

I also beg to call your attention to

another matter that I do not remember to have seen covered in any agricultural work, and that is the value of the ashes occasioned by the burning of stacks of hay. Any insurance company can give you an estimate of the tons of barley, oat and alfalfa hay burned annually in this state, and my observation has been that the ashes are left to leach out on the spot. According to Snyder, the ash of barley hay, for instance, carries potash, 20 per cent for the grain and potash, 23 per cent for the straw, also phosphoric acid, 35 per cent for the grain and phosphoric acid, four per cent for the straw. Roughly, a ton of the ash of a burned barley hay stack would contain 400 pounds of potash and 400 pounds of phosphoric acid. Of course these quantities are obtained from laboratory analysis. The question is whether the violent combustion of a burning stack would admit of the retention of these constituents and whether they would remain in available form. In this event the money value of such ashes would surprise the unfortunate owners of burned hay.—E. Y., Chula Vista.

The suggestion is a good one where one has access to such material. We question very much as to the quantity of such ash, but certainly every farmer within reach of such material understands its great value. Too many farmers do not understand the great value of straw as a mulch, and it is allowed here, as well as in the East, to be purposely burned and lost.

### Skim Milk for Hens

I have separator and would like to know if sweet milk is good for laying hens. It is a lot of bother to let it thicken.—Subscriber, Orange.

There is no increase in the nutrients of the feed by letting it sour, but, because of the beneficial effect of the acids, it is recommended by experts in feeding where it is allowed to sour. With calves it has been recommended that one should be consistent in feeding either entirely sweet or entirely sour, that is, not changing back and forth from day to day.

## Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

### Collecting Wages

What chance have I of getting money out of a company owning an orange grove when I do the work myself with team by the hour? They have not paid me for several months. Can I take their fruit in any way to get my money?—Subscriber, Porterville.

It is possible that you might be entitled to file a lien upon the property for such portion of your work as is done within 90 days of the date of filing said lien. Otherwise you should bring a suit and attach the real estate, growing crops, or other property of the company, obtain a judgment and satisfy the same out of the sale of the property.

### Property Deeded Away

While living in Oklahoma I purchased a house and lot of the value of \$3,000. I came to California, leaving my wife there until I obtained a position. At my wife's request, I deeded the property to her and she executed a deed to me, the consideration in each deed being \$1,500. She has since deserted me and destroyed the deed. How can I recover my share?—Subscriber.

If both deeds were destroyed the

title to the property would remain as it was. If the deed to you alone was destroyed and the deed from you to the wife recorded, she undoubtedly could convey a clear title to the property and you would be left to any remedy which you might have against the wife personally. You might bring action in Oklahoma and if such action was taken prior to the transfer of the property and notice of the filing of such action was recorded, any transferee of the wife would take with notice of your rights in the matter and subject to the outcome of the litigation. The matter of the consideration expressed in the deed makes little or no difference.

THE MISSION FIG

Continued from Page 39

than useless. When the tree has grown two years in the nursery this union becomes strong.

Cuttings are perhaps as satisfactory to plant as trees, provided water can be given once or twice during the first season. Two or three cuttings in a place will guarantee a better stand than when only one is planted.

Neglect in pruning bearing trees is a great mistake that is almost universally made. The branches become long and spindling and will sometimes grow five or ten feet, attaining a diameter of no more than an inch, in order that the tips may get "a place in the sun." The branches should be kept thinned out so that plenty of light can enter the entire body of the top. This will result in stocky branches that will produce large fruit and more of it. This will improve immensely the quality of the first crop, which is becoming popular as a shipper. In the desert regions this crop is a money maker as it is harvested in May and by summer pruning another crop of large figs is harvested in the fall.

EXPLORING UNCLE SAM'S LARDER

How much food has Uncle Sam in his national larder with which to start the New Year? How adequately can he feed until harvest time his many millions of civilians and soldiers? Will it be necessary during the coming 12 months for his citizens to eat war bread? Can he furnish the share which he ought of the daily ration needed by the fighting men of the allies? And can he supplement somewhat, perhaps, the meager fare of the friendly neutrals to whom the war has brought the pinch of hunger?

These are the big and vital questions, so important to the conduct of the war, which the bureau of markets of the United States department of agriculture is seeking to answer by carrying out the war emergency food survey provided for by the last Congress. All over the country today first steps are being taken to answer these questions. Hundreds of thousands of persons in control of food supplies, large and small, are filling out schedules mailed to them by the army of employees which the bureau of markets has assembled in Washington to conduct the big year-end food inventory. These schedules will show the quantities of more than 100 different foods on hand December 31, 1917, quantities on hand December 31, 1916, for comparison, and the quantities shipped out by freight or express that have not been delivered to the consignee. To the totals of these figures will be added quantities held by retail food dealers in certain counties where store-to-store canvasses are being made. The latter intensive surveys will be made in order that the figures for the entire country can be checked. In addition, about 40,000 selected families will report on special schedules regarding the stocks of food on hand, and the ways in which they utilize certain food products.

In two weeks the Treasury Department will issue blanks for returns of Federal War Tax

This involves every corporation, partnership and individual. It will be impossible to fill out these without complete instructions. Wrap up 50c, put in an envelope and send to us. We will send you the 32-page pamphlet, written by Ewell D. Moore, a San Francisco attorney and Federal tax expert, giving a complete analysis of the War Revenue Bill—written especially for the layman. Endorsed by banks—guaranteed to conform to the Treasury Department's ruling. *Please do not send stamps.*

## Egyptian Cotton

By F. W. Waite, Imperial County Commissioner of Horticulture

**E**GYPTIAN cotton growing in the United States was started in the year 1900, and in 1902 Egyptian cotton seed was distributed by the department of agriculture and planted in Barstow, Texas, Carelebad, New Mexico, Yuma, Arizona, and Calexico, California. These experiments were failures both as to yield and quality for three years. Continued selection, breeding and improved culture methods, along with seed acclimation, brought the enterprise to a profitable condition. In 1907, at Yuma, the lint per acre was recorded at 990 pounds, with the fiber one and one-half inches long, very strong and a delicate brown color so much desired. Of the four principal varieties of Egyptian cotton grown in Egypt (1,500,000 acres of Egyptian cotton in Egypt) the seed of the Mitafifi was used in this coun-

try. For various reasons the work was concentrated at Yuma. It was through selection of plants at Yuma that the variety known as Pima was developed. This was grown at the United States experiment station on the Pima Indian reservation. This season there are 30,000 acres of Pima and Yuma cotton in the Salt River valley. Next year it is estimated there will be at least 100,000 acres of Pima planted in that valley. It is claimed by those in authority that Pima has longer fiber, is stronger and has less waste than any of the other long staples. George Butterworth, government expert cotton classifier for the bureau of markets, made the above statement. He states that there is 5.73 per cent less waste in Pima than in fancy Sea Island and that the sooner this Egyptian cotton grown in the Southwest comes on the market

in large quantities the better. It is claimed by the department that a small amount of alkali is beneficial, as it checks the growth, hastens ripening, improves the length and strength of the fiber. The United States department also states that this valley is well adapted to the growing of Egyptian cotton, having demonstrated that the yield of one to two bales per acre is possible, and the fiber has been pronounced by experts as equal to the better grades imported from Egypt.

The principal objection to growing this cotton is the added cost of labor in picking on account of the bolls being smaller. This condition can and will be met, as it has already been met in the Salt River valley. The picking of Egyptian is not as difficult as picking short staple cotton, and anyone can learn to pick the long staple, while it requires training from boyhood to be a good short staple picker. Egyptian must be picked clean, which makes it necessary to

pick much slower than the short staple, consequently it is easier to learn. The added price of fiber gives a margin to handle the added cost. Short staple is now quoted about 28 cents, while Pima is 80 cents a pound.

Egyptian cotton is largely used for mixing with silk and for the manufacture of cloths in which a high finish and luster is desired. It also takes the process of mercerizing better than Sea Island or Upland cotton. It is used for filling satteen, Indian linens and similar goods having a brilliant surface. It is also used in the manufacture of Balbriggan underwear and lace curtains, with dyeing unnecessary. It is used very extensively for sewing thread, which needs to be very strong. Other goods wholly or partly made from Egyptian cotton are lawns, satteens, twills, serges and fabrics for covering umbrellas, as well as other highly finished goods, largely used in manufacturing of sewing thread and fabrics for insulating and for bicycle and automobile tires. Egyptian cotton is very much desired by the government for the manufacture of aeroplane wings.

Arrangements have been made with the United States department of agriculture and the Tempe Exchange for the Imperial Valley Long Staple Cotton Growers' Exchange to handle the seed for planting in this valley during next season. The government has jurisdiction over the Pima seed and dictates where it shall be placed and planted. They want to keep it pure and have devoted a great deal of time to develop the Pima, therefore they have certain regulations. We are promised 150,000 pounds of Pima seed. It is necessary for those who want to plant Pima to make their application at once to the Long Staple Exchange in El Centro. The cost of the seed is \$76 per ton, f. o. b. Tempe, Arizona. There will also be a small added expense for delinting the seed to make it absolutely free from Johnson grass seed.

As to the culture methods, they are the same as other cotton except the distance between rows and plants in the rows, also time of planting and irrigation. Rows should be at least four feet apart and the plants should be thinned 16 to 24 inches apart in the row. Still there are many opinions as to distance. The ground should be plowed deep, filled with water and put in good tilth before planting. Planting should be done from the 15th of February to the last of March; no irrigation after planting for at least 60 to 90 days or even longer, according to the character of the soil; but cultivate very much.

The Long Staple Exchange has asked the United States department for a field man as Salt River valley was furnished one. This valley being especially adapted to growing the high-priced cotton, it is advisable that farmers who are interested in the growing of cotton plant at least a few acres of the Pima. Make arrangements at once for seed through the Long Staple Exchange at El Centro, making the payment at the rate of \$76 per ton. The balance of the expense will be adjusted—for freight and delinting upon delivery of seed. First come first served. Arrangements are being made for boys of grammar and high schools to have an Egyptian cotton club. The enterprise has the support of the Long Staple Cotton Exchange and no doubt will have the services of the United States field man. Prizes will be awarded. The Long Staple Exchange has just notified me (Saturday, December 22, 1917) that they have already booked orders for nearly half as much seed as will be available, and they advise placing orders as early as possible, otherwise some may be disappointed. The first car of seed is now on the way here.

## MOLINE UNIVERSAL TRACTOR

*"It Solves the Farm Help Problem"*

**T**WO MILLION MEN will be gone from the farms because of the war—strong, skilled, willing workers, only a small part of whom can be replaced by older men, boys and women. Yet production of food must be increased. There is only one way—equip the men left on the farms so they can do more work than ever before.

With the Moline-Universal—the original two-wheel tractor—One Man can farm more land than was ever before possible, because—

One Man has power at his command equal to five horses, capable of doing the work of seven horses owing to its greater speed and endurance. This power is always available for any farm work.

One Man operates the Moline-Universal Tractor from the seat of the implement to which it is attached, where he must sit in order to do good work.

One Man can start in the spring and go from one operation to another—plowing, harrowing, planting, cultivating, mowing, harvesting grain or corn, spreading manure, filling the silo, cutting wood, etc., doing all farm work from one year's end to another, independently of horses or hired help.

All these one-man operations with the Moline-Universal are possible because it is mounted on two wheels, all its weight is traction weight; it is powerful—pulls two 14-inch bottoms easily—yet it is light so

that it does not pack the soil. The Moline-Universal attaches direct to the implement, making one compact unit.

One woman or boy operates the Moline-Universal as easily as a man. Miss Ruth Harding of Albion, N. Y., a proud owner of a Moline-Universal, writes: "I have never called a man from his work to assist me with the tractor in any way."

Thousands of Moline-Universal Tractors are now at work under every conceivable condition in all parts of the United States and in Canada, England, France, Sweden, Norway, Denmark, Russia, Italy, Spain, Mexico, Peru, Argentina, Brazil, Cuba, Guatemala, South Africa, Australia. Wherever a Moline-Universal Tractor is sold there is immediately a big demand for more.

The demand for Moline-Universal Tractors has far exceeded our expectations. We built an enormous factory which is devoted entirely to making Moline-Universal Tractors and three times have erected large additions to cope with the enormous demand. We now have the largest tractor factory in the world.

Moline sales and service branches cover the country. No purchaser is ever more than a few hours away from Moline service.

The Moline-Universal will solve your help and power problems. It is ready for you now. Write us today for free booklet giving full description of the Moline-Universal and name of nearest Moline dealer.

**MOLINE PLOW COMPANY, Moline, Illinois**

## FARMERS TO HELP IN FOOD SURVEY

**T**HE farmers of the United States will be asked to co-operate with Uncle Sam in making the first nation-wide war emergency food survey, which will be conducted by the bureau of markets. The bureau of crop estimates will work in conjunction with the bureau of markets in this branch of the survey and will distribute through their voluntary crop reporters one-half million questionnaires to representative farmers asking for the amounts of the important crops and numbers of live stock on their farms on December 31, 1917, and December 31, 1916. From the data secured in this way a fair estimate can be made of the crops and live stock in the hands of the 6,000,000 farmers of the nation as compared to a year ago.

The questionnaire which the farmer will fill includes 56 items asking for estimates on all important crops and kinds of live stock. The schedule also asks for the amounts of a number of crops produced during 1917, the size of the farm, number of acres in cultivation, and whether or not it is operated by owner or tenant.

The object of this survey is to aid in the making of intelligent plans for adequate conservation and distribution of existing food supplies and for production of adequate food, for which there is most urgent demand. It is a part of a general investigation, provided for by the last Congress, to ascertain the existing supplies of food and food material in the hands of every manufacturer and dealer of food products in the country. Officials of the bureau of markets state that the complete survey will yield the most accurate information ever collected in regard to the extent of the nation's food resources. It is considered an important step in the effort to place the country on a safe footing in so far as the food supply is concerned.

## FINENESS OF LIMESTONE

The Pennsylvania state college has been making an investigation regarding the relative value of limestone of different degrees of fineness. Investigations were made as to the pulverized limestone being soluble in water, as to its value in creating acidity, in promoting the formation of soil nitrates, in promoting the growth of plants and as to the rate of losses. A depleted farm was taken and built up largely by the use of limestone. One feature is of particular interest, and that has to do with the fineness of the screen and, as may be noted from the report, the results from applying extremely finely pulverized stone are not enough better to justify the use of fine screen.

On the basis of the results obtained, it was concluded that an application of limestone in which the entire product consists of very fine material is less desirable from the standpoint of permanent agriculture than one consisting of varied degrees of fineness; that an ideal application of limestone is one in which there is sufficient fine material (60-mesh) to meet the immediate needs of the soil and thus allow time for the coarser particles to disintegrate; that if the entire product will pass a ten-mesh screen and include all of the fine material, it is sufficiently fine for soil improvement if applied somewhat in excess of the immediate needs of the soil. Such a product should contain at least 50 per cent of material that will pass a 60-mesh screen.

"Three pigs in the place of every two you had last year" is a good motto.

## FENCE THE DITCHES

By R. H. Williams

The common practice in Arizona is to have one fence on the high side of the ditch bank and leave the other side open. This is satisfactory where the field is never used for pasturing. It is quite customary, however, to pasture almost every field in Arizona, and on this account each ditch should be fenced on each side to protect the ditch bank. If this is not done the animals will destroy the banks and irrigation will be made much more difficult. Horses, cattle and hogs are worse than sheep for damaging the banks. The latter are afraid of water and do little damage. Place the fence

four feet from the ditch, and it is best to have concrete outlet gates which deliver the water into the field. These should come within one to two feet of the fence. Make sheep gates into each field and also attach concrete water troughs to be filled from the irrigation ditches. Some kind of arrangement could be perfected whereby water for the stock could often be placed into the concrete troughs from the ditch.

## NITRATES OF VALUE

Nitrate of soda is of high value for early crops where rapid maturity is desirable, such as peas, corn, beets and cabbage. It is a special help to

hay, grain, rye, wheat, timothy, cereals and orchards, all of which are unable to obtain sufficient nitrogen from the soil just when they need it. It is a great specific in the production of sugar beets, potatoes, cotton and cane.

Small fruits, such as blackberries, currants, raspberries and gooseberries, which need a steady, even growth, are greatly benefited by nitrate of soda, which can be furnished all ready for digestion when the plants require it.

## SO SAY WE ALL OF US

First Working Girl—Say, Mame, I heard an awful sad thing this morning.

Second Working Girl (wearily)—So did I—the alarm clock.—Life.

## "A Poor Orchard"

"It certainly is! Slow in bearing to begin with—a year behind some neighboring ones. Poor fruit and little of it when it did bear. And now it's petering out entirely, when it ought to be at its best. What's the reason? Blessed if I know."

His experience is not uncommon. Perhaps you are asking yourself just the question he did—although here's hoping you aren't. But if you are this advertisement may hold the answer. It does for the fellow above.

He didn't know it, but his troubles began when he failed to blast the holes for his orchard with

## HERCULES DYNAMITE

As a result he didn't plant his young trees. He "buried" them. Their roots were jammed into a small hole with firm, hard sides. They had no such yielding, receptive earth in which to spread as they would have had if planted in dynamited holes. The trees were never given a fair chance.

Hercules Dynamite has been the making of many an orchard. You plant

with it to begin with and then, later, you shake up the ground between the trees in much the same way. The result is an orchard that bears earlier and gives much more and better fruit.

There is a book, "Progressive Cultivation," that tells all about it. The reading of it will mean money in your pocket. It is sent free on request. Mail the coupon below, today.

## OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

## THIS WEEK'S COVER

Herefords have not long been favorites in California, but they are marching into favor as is shown in the illustration on this week's cover. There are thousands of pure bred now in the state. There are many more thousands of beef steers which are of far greater value because of White Face blood. Such scenes as this, with its background of rich feeds show in a small measure California's part in feeding the world.

## THE MONROE DOCTRINE

Those who feared that this country entering a European war would terminate absolutely the Monroe Doctrine are finding since reading President Wilson's last great message to congress that the war is to result in the extension of the Monroe Doctrine to all the world, that is liberty and justice and right of the smaller nations to live without trespass of the powerful bully, and if he does trespass he shall restore the wrong.

## CLOSING THEIR DOORS

It is probable that there is no city in the country but has its record of dealers in perishable farm products taking to the "bay" or other dumping place and destroying tons of valuable food. This simply for the purpose of holding up prices and preventing a glut. Times have changed. "The United States food administration has revoked the license of Lester Brothers, wholesale food handlers of Newport News, Virginia, for refusing consignments of potatoes and allowing them to deteriorate in the freight yards. They were ordered to close their doors on December 31 and forbidden to deal in any commodities covered by the Food Control Act."

The above from letter just received from Mr. Holman of the United States food administration.

## WEATHER

The East is "enjoying" blizzard after blizzard. Temperatures ordinarily below zero, and with the wind at 60 miles an hour mean suffering where coal is short. California is bathed in sunshine. Attendants at flower shows and festivities wear filmy gowns, parasols are in order, and out door life is enjoyed to its fullest.

Between ourselves, a bit of rain would not be amiss. We hope it is coming soon, but let's not grumble.

## COOPERATION

There never was a time when there was such general discussion of cooperative methods. Uncle Sam himself is cooperating with all the rest of the civilized world in an effort to improve the cooperative spirit. He is going to win, but in order to do it, we must take advantage of every step to

## Team Work

It ain't guns, nor armament,  
 Nor funds that they can pay,  
 But the close cooperation  
 That makes them win the day.

It ain't the individuals,  
 Nor the army as a whole,  
 But the everlastin' team work  
 Of every bloomin' soul.

—Kipling.

secure greater efficiency, and this can only be secured through cooperating with others. In other words, "It ain't the individuals, but the everlastin' team work."

## SORGHUM GRAINS

The department of agriculture has issued a statement regarding use of sorghum grains in place of corn. It has found that the grains of kaffir, milo and feterita have at least 90 per cent of the feeding value of corn, and with that as a basis the price of these grains is far less than 90 per cent of the price of corn. These have been found especially valuable fed with silage, and it is urged that the whole Southwest put up more silage and feed more sorghum grains.

## GOVERNMENT PUBLICATIONS

We recently referred to two series of publications being issued by the government dealing with war topics which might be secured direct from Washington. These were Red, White and Blue Series, and War Information Series. Some subscribers have misread this notice and have sent to the Cultivator request for them. They are not in the hands of the Cultivator for distribution and can only be secured by writing to Committee on Public Information, Washington, D. C. Please do not write this office for this set of books.

## TRACTORS TO FRANCE

The department of agriculture is lending every aid in its power to induce and help greater production. The food administration, whose duty it is to see that the entire world is fed, is looking beyond the boundaries of the United States and is sending to France 1500 farm tractors. France will be suffering still more unless it grows more foods. These tractors are to aid in that campaign. It is proposed to land them in France before the spring plowing is ended. Five hundred have already been sent.

May not the department of agricul-

ture give more material aid by some such practical work of introducing farm tractors to many a farmer who is unable financially to handle so large an investment. This may be a revolutionary suggestion, but these are serious times and more food must be had.

## W. S. S.

"Boys and girls of the Cultivator family, have you bought your War Savings Stamp? If not, have you bought your Thrift Stamp? We hope there is not a kiddie in the Cultivator family but is showing his thrift and his patriotism by emptying the little savings bank and earning a penny at every turn possible and putting it into the Thrift Stamps. Twenty-five cents buys a stamp. Four dollars worth of these Thrift Stamps, together with 12 cents, prior to February 1, buys a War Saving Stamp, then interest begins, and in five years from January 1, 1918, the \$4.12 becomes \$5.00. Every boy and girl who has not the satisfaction of owning a liberty bond may have great satisfaction in the owner-

## This Week's War News

Spain is threatened with revolution.

Rumors from Berlin indicate that the people are incensed at the failure of the militarists to make peace with Russia.

There have been fierce attacks on the part of the Turks on the English forces around Jerusalem, all of which have had no effect.

America's draft law has been declared constitutional and the draft boards are now working nights and Sundays on the next great draft.

Activities in the United States war department have increased and more rapid movement of the Liberty Army is expected from this time on.

Rumor is again insisting that Japan will send her army into Siberia because of fear of German influence yet securing control of European Russia.

Outrages in Mexico are being renewed. A railroad train was stopped last week and many were killed, one of the number a Los Angeles business man.

Sir Cecil Spring-Rice who has been British ambassador at Washington since 1913 has returned to London and it is rumored there may be a reorganization of the British embassy.

The storms in the Alps have been a great aid to the Italian forces, and with the aid of British and French troops they have driven the Teutons across the Piave and made gains in practically the entire length of the line.

The grasping nature of Germany has been shown so plainly in its peace terms demanded of Russia that German sympathizers in America are deprived of one long argument. Germany wants peace, and she wants the world thrown in.

The fighting on the eastern France front has been more or less intermittent excepting that artillery action is incessant. The long expected plunge of the Teutons is yet to come. The most definite attacks have been made in the Verdun section which the French have withstood and even gained some German trenches.

The Brest-Litovsk conference between representatives of Russia and Germany was abruptly ended by the Russian delegates refusing German demands and refusing to hold further conference unless the conference was transferred to Stockholm. Russia is reported to be mobilizing her troops again and her Baltic fleet is showing preparation for more active service.

Lloyd George's great address almost startled the world for at first reading it had a bit of the appearance of weakening and an appeal for peace before a complete victory. More careful reading shows, that while it recognizes the world's desire for peace, and its abhorrence for war, it still insists on the great underlying principle of "no peace until permanent peace."

On an hour's notice, President Wilson addressed both houses of congress and in detail told the world what America is fighting for. In a word, America demands the extension of the Monroe Doctrine to the entire world. Some think it an appeal to the Russians to encourage that stricken nation to stand for the liberty of all its own people. It endorses Lloyd George's address to English working men. It shows there is no dissension in the ranks of the Allies. There shall be freedom of the seas, no indemnity, but there shall be restoration. Alsace and Lorraine shall be returned to France. Brute force hereafter, must give way to right. There is no quibbling and Germany has a definite answer before she has asked her question.

Grow a garden. Grow it now!

# Agricultural News Notes of the Pacific Coast

## Northern California

Yuba County reports the total precipitation for the season at 1.87 inches.

Farm bureau centers of Sacramento County have elected delegates to the county bureau.

J. H. Guill and B. B. Meek have been elected to head the Butte County farm bureau.

Petaluma hatcheries report orders for chicks not nearly so heavy as last year same date.

Placer County promises to exceed the demand made upon it for big wheat production.

Sacramento Valley orchardists will use thousands of acres of young orchards for intercropping.

Extreme northern end of the state was given a present at the end of the old year of a soaking rain.

Eldorado County farm bureau is now fully organized, with Farm Adviser Burl Jones on the ground.

Butte County olive growers are harvesting fruit later than any preceding year since olives have been grown.

Butte County farm bureau meets on February 5 at Oroville. At that time four delegates at large will be elected.

Farm bureau at Shasta County is arranging irrigation meetings which have to do with best methods of work.

Supervisors of Sutter County have purchased tractors to aid in road construction, this because of shortage of teams.

Raisin growers of Yolo County are getting together in order to make connection with the Associated Raisin Company.

Rice straw in the cheaper grades of mattresses has been proving so effective that a new demand is developing for it.

The Placer County farm bureau fair which was held last summer at Auburn resulted in a net gain of several hundred dollars.

Sutter County is planting more largely to sugar beets than any preceding year. They will market through the Alameda Company.

Eldorado County is planning for extensive planting of pear and other trees this season. Every orchardist is being urged to plant as early as possible.

Northern California Counties Association is to make a survey of production possibilities of Siskiyou, Trinity, Shasta, Modoc and Lassen Counties.

The annual meeting of the Vacaville Fruit Growers' Association recently resulted in the election of C. J. Uhl, president, and W. H. Buckingham, secretary.

Samples of Yolo grown cotton sent to experts at Phoenix, Arizona, have brought reports "this cotton is very good, the grade being fancy, which is our highest grade."

A superior judge of Tehama County has rendered decision upholding validity of assessment levied by Reclamation District 833. This assures reclamation of some 40,000 acres in Butte County.

The earlier harvested olives of Butte County have been cured and are now on their way East and vats are being rapidly filled with the new picking. Practically the entire pack of Butte County has been sold.

## Central California

Some plowing is being done in sections which received Christmas rainfall.

The Central California Egyptian Cotton Growers' Association has been organized.

Wallace Sullivan is the new farm adviser for Kings County. He is already on the job.

Riverdale, Fresno County's farm center, is discussing "How is the new silage coming on?"

Tulare County has 62 fruit packing houses which were all in operation during the past season.

The first meeting of the Dinuba, Tulare County, farm bureau center will be Monday, January 14.

Farmers of the Salinas Valley are discussing as to best methods of culture of beans, also as to markets.

Kingsburg, Fresno County, claims to be the banner district in the signing of the new contract with the Associated.

Livestock men of Eastern Tulare County are discussing methods of saving stock in the absence of any pasturage.

The California Peach Growers is discussing methods of more extensive packing houses and more effective equipment for another year.

Forty thousand dollars of state funds will be expended by State Horticultural Commissioner Hecke in eradication of ground squirrels.

The Associated Raisin Company is continuing its campaign for membership. It is expected to secure a total of 125,000 acres before February 1.

The newest association of men handling dairy products is the California Butter, Cheese and Ice Cream Makers' Association. R. W. Hatton, Los Banos, is secretary.

Application has been made to the state water commission to appropriate 60,000 acres of water on the Pitnam and Tamarach creeks, tributary to the San Joaquin River.

Tulare County creameries paid out cream checks for November butterfat amounting to nearly \$140,000. This was \$28,000 less than cream checks for the same month last year.

Tulare County this season has shipped out 2237 carloads of fruit. Grapes were the biggest shippers, making up 1964 carloads. Apples were at the bottom of the list with only one carload.

George C. Roeding says that Fresno must wake up and teach the world that "here in the central portion of the Golden State there is an empire worthy the attention of the man with the dollar."

California Prune and Apricot Growers' Association has paid to growers of fruit more than \$5,000,000, and before the end of the season will have transacted a business aggregating more than \$10,000,000.

A feature of the regular December meeting of the Fresno County farm bureau directors' meeting was an explanation of the work done on the Pine Flat irrigation project. W. P. Boone, executive secretary of the project, presented report.

The Oakdale and South San Joaquin irrigation districts have received a proposition from the Sierra and San Francisco Power Company relative to the building of a great storage reservoir in the mountains along the Stanislaus River.

## Southern California

The bonds issued by the Los Angeles Flood Control District have been declared valid.

The Elsinore farm center held a meeting December 27 at which olive pruning was discussed.

Los Angeles County supervisors have appropriated funds to secure the appointment of a farm adviser.

H. E. Drobish, assistant farm adviser of San Bernardino County, is working up the formation of a cow testing association.

Reports from Orange County farmers who are using poisoned barley in their squirrel campaign indicate that they are making a big haul.

The Imperial Valley Long Staple Cotton Growers is purchasing 150,000 pounds of seed which will plant 4300 acres of Pima cotton next season.

The cyanide situation, which has been so strenuous since the beginning of the war, is now much better, and deliveries are being made freely.

Mrs. H. H. Clark of Calipatria received a check for \$1395 in payment of a motor truck load of turkeys which she sent to Los Angeles for Christmas market.

Bean growers of Southern California are discussing the formation of a general bean association to cooperate in marketing with the Lima Bean Growers' Association.

At the meeting of sugar beet growers of San Fernando Valley, December 12, investigation was made into cost of growing sugar beets. The total was found to be \$11.78 per acre.

Milk dealers of Redlands have announced a rise in retail prices of milk from 11 to 13 cents a quart and from six to seven cents a pint, the rise being effective the first day of the year.

Work is progressing on the great irrigation scheme which is intended to water many thousand acres of land in the northern and eastern portions of Imperial Valley. Water is to be taken at Laguna Dam.

Los Angeles is presenting a big poultry show January 9 to 15. The Rabbit and Pet Stock Association of Southern California is there with a large exhibit also. A long list of prizes is offered to exhibitors.

The Imperial County Farm Bureau reports as result of a canvass recently made amongst the producers of seed milo, that the valley has available in sight at least 79 tons of seed. It is reported that the valley will plant 106,000 acres the coming spring.

There has been less than usual talk as to frost protection of citrus groves, but many orchardists are prepared for cold weather. Pomona, organized as usual, has regular motorcycle patrol, which in time of cold can cover 12 square miles once hourly.

San Bernardino County Farm Bureau is discussing drainage and other problems. Meetings will be held at Highland Center, Jan. 15; San Bernardino, Jan. 17; Redlands, Jan. 18; Summit, Jan. 21; Lucerne, Jan. 25; Barstow, Jan. 28; Bloomington, Jan. 30.

San Bernardino had a big poultry show the week ending December 22. The grand gold sweepstakes for display, \$50 in gold, went to the Hocking Poultry Farm of Los Angeles; second prize, \$30 in gold, to Mrs. Ben Davis of Cucamonga; \$20 gold to Mrs. E. B. Martin of Downey.

## The Coast and General

New Zealand is importing wheat from Australia.

Josephine County, Oregon, recently held a corn show.

Umatilla County, Oregon, will soon have a county agricultural agent.

Franklin County, Washington, has decided to secure the services of a county agriculturist.

The Western Dairy Products show will be held at North Yakima, Washington, February 28-March 2.

Omak, Washington, has shipped out 291 carloads of apples this season, orchardists receiving \$144,000.

Apple growers of Yakima, Washington, are shipping 20 cars of apples to American soldiers in Europe.

The number of horses for agricultural work have greatly increased in England during the past year.

A cooperative creamery at Carlton, Oregon, has been equipped for the manufacture of cottage cheese.

North Yakima, Washington, will have a municipal pig farm where hogs will be fattened on city garbage.

Nearly 30,000 tons of beets were delivered during November to the sugar factory at North Yakima, Washington.

Belgium has given to General Pershing 600 locomotives for transporting supplies from the water front to the trenches.

Farmers of Washington are maintaining a market at Camp Lewis. One consignment consisted of an entire car of carrots.

A wheat convention was held at Pullman, Washington, January 3-5. Grain standards and cultural points were thoroughly discussed.

Hereafter only five pounds of sugar per family and from 25 to 50 pounds of flour, according to family, is the food administrator's ruling.

Owing to war demands for ammonia, the country is appealed to to harvest and store all the ice possible. Nothing doing in California.

English feeders are suffering because of the scarcity of cotton seed. There are thousands of tons already purchased and in Egypt, but shipping is impossible.

The "Oregon Farmer" is authority for the statement that with all crops except apples Oregon is behind her last year's production. This is because of unusual weather conditions of the early spring.

At a recent meeting of the Deschutes Valley, Oregon, potato growers' association, reports made brought out the fact that there are 50,000 sacks of potatoes stored in warehouses in central Oregon.

The extension school held by the University of Arizona in the Yuma Valley brought out exceptionally large attendance. The handling of livestock, cotton and alfalfa were the principal subjects considered.

Farmers and housekeepers' week at the university of Tucson, Arizona, will be January 14-19. The state council of defense and the food administration will cooperate with the university in the activities of the week.

New regulation has been made governing the use of food materials for making distilled spirits, in effect that no grain other than of inferior quality shall be used for making distilled spirits for any purpose whatsoever.

## Who's Who

With the issue of August 11 the Cultivator started its series of "Who's Who" articles to bring before its readers some of the livestock producers of California who are responsible for the large development of the industry. Where did they come from and how long have they been engaged in California development, also how do they look, so pencil and camera are to be used, and some homely, everyday photographs and notes regarding them will bring us closer together. Bear in mind we say "homely photographs" and not photographs of homely people. The idea we wish to convey is that so far as possible we will secure photographs in everyday surroundings at the homes of the livestock producers.

Written for California Cultivator By F. F. Stonerod

H. H. GABLE

ANY young men who have inherited large country estates either dispose of them as soon as possible or rent them out to be impoverished.

H. H. Gable, of Esparto, Yolo County does not belong to that class.

Educated in preparatory school and

H. H. Gable

college by a wise father, Mr. Gable immediately returned to the ranch

and assumed charge of its affairs. There were thousands of acres of range land and a good many hundred acres of farm land on the Gable estate, and to farm it all scientifically requires more than ordinary ability.

The elder Gable always fancied beef cattle, horses, and mules, and the son has continued that policy except that instead of registered males and grade cows he has founded a pure bred herd of Hereford cattle which in time will rank with the large ones in California.

Mr. Gable is a Hereford enthusiast, so much so, in fact, that he was recently elected president of the Pacific Coast Hereford Breeders' Association. To show the quality of the man it may be mentioned that he took two or three head of young Herefords over to the state fair this year, knowing that they were not in show shape and that it was not possible to fill out a full herd. He wanted to have as large representation of the breed on hand as possible.

Mr. Gable is a director in the Woodland bank and also in the Yolo County fair. He is president of the county board of trade and takes an active part in anything which is for the encouragement and upbuilding of the community.

## Does It Pay to Feed Alfalfa Fresh and Green From the Field?

Written for California Cultivator By J. M. Bomberger of Green-Gold Ranch.

ONE morning in May of 1904 while I was working in a small vineyard which I had rented my neighbor "spoke across the fence" from his alfalfa field where he was looking for bloat among his cows and complained to me that even though he owned his 60 acres of excellent alfalfa land and thirty cows, he found dairying very arduous and a losing game, and incidentally stated that if he had a good opportunity he would rent his ranch and sell his cows. He did not consider me as a possible applicant as I was very young and had less than a year before come from office book-keeping to the farm and had a very limited experience at farming.

During my short farm life I had, however, read farm papers and bulletins with an appetite and had studied Henry's Feeds and Feeding, King's book on the Soil and King's Physics of Agriculture, and had just lately been enjoying Frank Peer's book on Soiling Dairy Cattle.

The result was that within 24 hours I had persuaded that neighbor to rent his ranch to me and to sell his cows and necessary implements to me, taking a promissory note as payment. His system had been to feed his cows by pasturing and making hay of what little alfalfa the cows did not eat, and by that method he could not save enough hay for winter feed, and even though he had no rent nor interest to pay, he found dairying a losing game.

My freshly read book knowledge coupled with my youth and lack of experience filled me very full of enthu-

siasm for the work. I at once enlarged the cow corral, built a feeding rack and began soiling instead of pasturing. By soiling I mean cutting the green alfalfa and feeding the green alfalfa to the cows in the feeding rack in the corral. I also at once secured a milk scales and a four bottle Babcock tester and put it up to the cows to "do or die."

I sold seven cows to the butcher. The remaining cows produced more under the soiling system than the entire herd had produced by pasturing. I had saved enough surplus hay by fall to winter feed my cows and had enough left to sell to pay my rent. My wife and I did the milking without hired help, and in 11 months we were out of debt. That was our first step toward the ownership of our present ranch in the Wood Colony near Modesto where we still live and keep cows, but during the last seven years we have done very little of the milking ourselves.

All this is preliminary to the fact which I wish to impress that it is more economical and practical to feed a herd of 25 cows or more by soiling than by any other method that I have yet found.

I have carefully estimated that an acre of alfalfa cut and fed to dairy cows fresh and green is at least ten per cent more efficient for milk and butter fat production than the same acre fed in the form of hay, and it costs less to put the green alfalfa into the feeding manger than the same alfalfa in the form of well cured hay.

On my ranch the mower and rake

are left in the field from day to day during the growing season. To get feed for the cows one man will hitch two horses to the wagon, drive to the field, hitch to the mower and cut enough for one day or two, then hitch to the rake and rake and bunch it, then hitch to the wagon and load the grass without anyone on the wagon and haul it directly to the manger where it is fed from the wagon in three feeds a day.

The labor to secure one day's feed for 30 cows requires on an average not more than one and a half hours all told, or two and a half hours for two days' feed. We bring in two days' feed during cool weather in spring and fall and on Saturdays.

To feed it in the form of hay it must be mown, raked, carefully shocked, then two or three men must drive to and from the field instead of one. A man is needed on the wagon as loader. The hay must be stacked or put into the barn, which is expensive. Cows will not do well on hay direct from the field, especially in mid-summer. The hay must be cured in the mow or stack. Later the hay must

be taken from stack or mow to the manger. The handling of hay causes loss of leaves and fine stems and even at best the hay is ten per cent less efficient than the same alfalfa fed green.

Many times during wet spring or fall weather I have noticed dairymen scattering and turning half spoiled alfalfa trying to make hay and later feeding half spoiled hay to their cows for months, while my cows ate fresh green alfalfa from the middle of March to Christmas regardless of the weather.

Another consideration is that when my alfalfa is taken off the same day it is cut, the new growth is left to grow at once unmolested by being covered by swath, windrow or shock or by driving over and crushing the young growth after it has had a week or ten days start as is the case in hay making.

We, of course, make hay of the greater part of the alfalfa which we do not need for soiling as we must have hay for the winter months, and we always have a surplus of hay for sale.

## Canning Meat

**S**O MANY demands have come from all over the country for practical methods of canning meats that much experimenting has been done. We give below directions sent out by the state college of New York:

### Method 1

Free the meat from the bone, and cut it in pieces of such a size that they will go into the jars easily. Pack the raw meat solidly into tested clean jars, filling the jars to within three-fourths inch from the top. Sprinkle over the top of the meat one-half teaspoon of salt for each pint of meat. Add no water. Celery leaves, onions, pepper, or other seasonings may be added if desired. Adjust on the jar a new rubber of good quality. Place the cover on the top of the jar, and adjust, but do not fasten, the upper wire clamp, or if a mason jar is used, partly screw on the cover. Place the jars on a rack in a tightly covered container, such as a wash boiler or a sap bucket, in which there is warm water that reaches to within about one inch from the tops of the jars. Sterilize the meat by cooking it for from four to five hours, beginning to count the time when the water around the jars reaches the boiling point. A steam cooker is particularly convenient for this process, and a pressure canner reduces the sterilization period, but a wash boiler or a sap bucket answers the purpose satisfactorily. Before removing the cans from the sterilizer, complete the sealing of each jar by adjusting the lower wire of the clamp or, in the case of a mason jar, by screwing the top tight. Keep the jars in a cool dark place.

### Method 2

Sear the meat in a hot oven, in hot fat, or in boiling water, and steam it or simmer it until it can be torn apart. Pack the meat into the jars, fill the space with stock, and add one-half teaspoon of salt to each pint of meat. Sterilize the meat for three hours as in Method 1. Unless the meat is first browned, it does not have so good a flavor as that of raw meat steamed in the can.

### Canned Chicken

Chicken may be successfully canned by either of the two methods suggested. Canning surplus cockerels that

chickens should be covered with cold water, salted, and slowly simmered until the flesh drops in shreds from the bones, and the liquid, or stock, is concentrated. Seasoning, such as onion and a bit of celery leaf, may be added. Strain the stock, if desired, reheat it, and boil it for ten minutes. Pour it into sterilized jars, and sterilize it as described under Method 1 for one hour on each of two successive days.

### DON'T WASTE STRAW

BURNING straw is like burning money for straw means money to the man who knows how to use it. Nevertheless 15 per cent of our straw is burned and 22 per cent more is disposed of in more or less unprofitable ways. Only about two-thirds of the crop is fed to live stock or used as bedding, although these are the real ways to turn it into money.

Large amounts of roughages are necessary to the economical feeding of cattle and there is no more efficient way of utilizing them than this. Straw lessens the need for expensive concentrates and when marketed as meat brings greater returns than are likely to be obtained by disposing of it in any other form. Indirectly the gain in soil fertility is enormous. There is no system of obtaining permanent soil fertility which equals in practical advantages the feeding of live stock. The plowing under of straw adds little more humus to the soil than manure and it does nothing else of value.

Burning straw means an almost total loss. The ashes, it is true, carry a certain amount of mineral matter into the soil, but the quantity is too

small to exert any appreciable effect. The usual explanation of the practice in those sections where it is followed is custom. But because straw has been wasted in the past is no reason for wasting it now. Feed it or use it for bedding. If circumstances actually make the keeping of meat-producing animals an impossibility, plow it under. Never burn it.

### HIGH FEEDING VALUE IN TANKAGE

WITH concentrates mounting ever higher, and with even roughage commanding almost former concentrate prices, the hog feeder is confronted by a serious problem. Naturally he is turning in every direction. Barley and the sorghums are proving very satisfactory, and last year saw the state's greatest production of the sorghum grains.

Many are feeding tankage, packing house waste product, which is proving especially satisfactory where protein feeds are scarce. In any case tankage is worth more attention than it receives from the average stock feeder. The hog is naturally a meat eating animal and in supplying the elements contained in tankage it is an especially appetizing and satisfying addition to the rations.

Brood sows may well be fed a portion, as it increases their vitality and lessens loss at farrowing time. Pigs learn to eat it and thrive phenomenally. State experiment stations have shown that sows given a balancing ration of tankage during the period of gestation will farrow pigs which are 10 to 25 per cent heavier, also much healthier, and such pigs when given tankage will grow more rapidly into hogs, maturing four to six weeks earlier than pigs not fed on a ration properly balanced.

## Field Notes from the Live Stock Men

Notes from Many of California's Live Stock Pastures. Personals as to Breeders and Breed

Kansas hog population has decreased 17.3 per cent in the last year.

Growers in the corn belt are, as a rule, planning to sow more largely to spring wheat.

The dressing percentage of Merry Monarch, the grand champion at International, was 64.7.

Stockmen of Alberta, Canada, are planning for a series of spring stock shows and sales in April.

Montana's wool clip for the last year is 18,200,000 pounds, exactly 2,000,000 pounds short of last year.

The showing of draft horses at the recent International, from the breeders' standpoint, was by far the finest ever made.

The food administration has fixed price on car lots of cold storage eggs from Chicago at not exceeding 41½ cents per dozen.

The Chicago hog market is somewhat uncertain, the high point being around 17¼ cents, with the average 17 cents and under.

The Daniels and Owens sale of Shorthorns resulted in Village Pride, the top notcher, going at \$1,800, going to Flinton, Kansas City.

Secretary Houston says there must be fuller utilization of the labor now in this country, and that the department will cooperate in transferring seasonable labor from one section to another.

The Christie sale of Herefords at Wood Lake, Minnesota, was held during weather which was below zero, and an average of \$435 on the 66 head sold is reported. A yearling bull was the top notcher at \$2,500. The top notch female went at \$975.

N. M. Lester, Gridley, reports the sale of registered Poland-Chinas to George P. Alf, Colusa, two gilts; L. A. Sturdevant, Sultana, boar; Louie Mitchell, Tipton, boar; H. Jameson, Plymouth, boar; Hillman Willard, Red Bluff, gilt; C. M. Ruggles, Guinda, gilt.

F. H. Everson, manager of the Lake Mills Holstein Breeders Consignment Sales Company, announces the spring sale of this great Wisconsin institution to be held at Lake Mills, May 1 and 2, 1918. There have been some wonderful Holstein sales at Lake Mills, and breeders are naturally looking forward to the coming event with interest.

Dr. Bert J. Cady, for many years doing special work for the Bureau of Animal Industry, U. S. D. A. in California, has been transferred to the same kind of work in New York state, at Cornell University, Ithaca, New York. Mr. Cady has done much valuable work in California and we regret to see him leave and wish him success in his new field. He will be succeeded in California by Dr. A. J. Payne, formerly of Kentucky, who will be stationed at the University of California, at Berkeley. Welcome.

Frank Reed Sanders of Arizona, writes appreciatively of the excellent Arizona number of the California Cultivator issued after the recent state fair. Regarding his recent sale of pure bred Holsteins, he says there were several hundred people at the sale. Twelve head averaged \$403. The champion bull brought an even thousand dollars, a first prize yearling heifer \$675, junior yearling heifer and junior champion \$600. The average for the entire 45 head sold during the day was \$300. Mr. Sanders adds "people want Holsteins of quality."

Sales of Poland-Chinas reported by R. H. Whitten are: Service boars to J. W. Brown, Tejon Ranch; D. S. Llewellyn; L. C. Mullis, Alfred Mathews, Nevada; C. A. Rives; Alvin E. Weaver; bred sows and gilts to H. N. Colver; P. L. Buckheim; A. R. Doctor, Mrs. Nettie Douglas, J. C. Groupe; J. W. Kingry; W. E. Levee; C. K. Loe, Oregon, Dr. W. R. Livingston, L. C. Mullis, L. J. Popp, Mrs. Viola L. Renwick, Elmer C. Rutherford, Mrs. E. Raspipe, Frank H. Sharp, Mrs. S. M. Smyser; weaned pigs to L. C. Mullis, Frank H. Sharp, Elmer C. Rutherford, S. M. Smyser.

## A Wonderfully Bred Bull

The first bull in the world to have an average of over 1000 pounds butter in one year for his seven nearest dams was dropped in the herd of A. W. Morris & Sons Corporation, Woodland, on December 27. He is out of Aralia De Kol Pontiac Mead, the California state record senior 2 year old that recently completed a record of 934.25 pounds butter in one year, and he is sired by Sir Aaggie De Kol Acme, son of Aaggie Acme of Riverside 2nd, 1331.41 pounds butter in one year on strictly official test, a world's record, and 2426.51 pounds butter in two years, also a world's record. Thus this youngster has the following as his seven nearest dams, Aralia De Kol appearing twice:

Aralia De Kol Pontiac Mead, butter in one year at two and a half years of age, 934.25 pounds. Aaggie Acme of Riverside 2nd, butter in one year at six years of age, 1331.41 pounds. Aralia De Kol Mead, butter in one year at two and a half years of age 870.61. Aralia De Kol, butter in one year at 11 years of age 1142.32. Aaggie Acme of Riverside, butter in one year at six years of age 808.82. Riverside Sadie De Kol Burke, butter in one year at 8

years of age 1085.12. Aralia De Kol, butter in one year at 11 years of age 1142.32. Total, 7114.85. Average for seven dams 1016.40.

It will be noted that this average includes the two year old records of the dam and her dam. The latter, Aralia De Kol Mead, is now well along on a yearly test and barring accident will finish something above 1100 pounds butter, while the dam of this bull and Aaggie Acme of Riverside 2nd are both likely candidates for higher records, all of which gives this royally bred youngster a richness of inheritance that has so far never been equalled.

To wash milk utensils properly they should be rinsed as soon as emptied, as the cleaning can be accomplished better than when left for several hours before washing. Lukewarm water unites with the milk readily and is preferable to cold or hot water for rinsing. Hot water will cook the milk upon the vessels.

By furnishing plenty of meat and fat to our Allies the great American hog can fight quite as formidably as his wild-boar ancestry.

# Real Food Conservation Calls for a Silo on Every California Ranch

Save

1-wheat  
2-meat  
3-fats  
4-sugar

**D**AIRYING is one of the big industries of California. Now, more than ever, the people need dairy products in order to save the meats, the grains—foods needed to win the war.

“Less grain is available for feeding to cattle,” says Bulletin A 1.23 of the U. S. Dept. of Agriculture. “For much more is needed now for human food, and the emergency demands that every effort be made for conservation.”

“Milk production must be maintained, hence every effort should be made to substitute other feeds for grain in the dairy ration. To do this, the silo will help. . . . With silage in the ration, dairy cattle can be kept in the condition of health common to animals on pasture. . . . The silo at all times, and particularly now, offers to the farmer one of the best means of reducing his feed bills.”

FOLLOW UNCLE SAM'S ADVICE — PLACE YOUR ORDER EARLY FOR AN

# INDIANA SILO

Indiana is the popular silo of California, just as it is of the Nation. Over 65,000 Indiana Silos are now helping to conserve the grains—supplying a dairy ration that will take the place of high-priced hay and mill feeds. An Indiana Silo will save its initial cost in less time than ever now on account of the great advance in hay and mill feeds. And you can buy an Indiana for less tons of hay, less pounds of butterfat, less bushels of grain, than ever before.

### Special Early Buyers' Discount

Now is the time to order your silo, for we are making our special discount to early buyers now. Write for the Indiana catalog — filled with experiences of Indiana owners on the Pacific Coast—how it made money for them! Use the coupon below! Do it now before you lay this issue aside.

## Reducing Losses From Hog Cholera

ALTHOUGH hog cholera can not be completely eradicated from the United States under present conditions, losses from the disease can be materially reduced by education and organization of hog raisers in the application of proper sanitary measures and the proper treatment of hogs with anti-hog-cholera serum. This has been shown by the results obtained by the bureau of animal industry of the United States department of agriculture in experimental work in hog-cholera control carried on in a number of counties during the past four years.

### Hog Raising Thrives Under Control

One of the important results is the fact that the work, while effective in reducing the disease, was not repressive while in progress on the hog-raising industry. On the contrary the industry thrived in the experimental counties to a greater degree than in adjacent counties in which no control work was under way.

Actual statistics were taken in the experimental counties and careful estimates were made in the adjacent counties. These show that in one group of three counties where the control work has been under way four years, the percentage of loss from hog cholera has remained constantly from one-quarter to two-fifths the percentage of loss in the 15 surrounding counties. In another group of experimental counties the average percentage of loss as compared with that in 18 surrounding counties was reduced from approximately nine-tenths in 1913 to less than one-third in 1914 and to about one-sixth in 1915.

### Community Needs in Combating Cholera

Specialists who have supervised the

control work of the department reach the conclusion that while the eradication of hog cholera can not be expected for a considerable time, the material reduction by the use of serum of the enormous losses which annually are caused by the disease is entirely

## Big Records at Hollow-Hill

G. W. Wilder's Hollow-Hill Farm at Redlands has recently accomplished a unique feat in cow testing with two four and a half year old Guernseys, Imp. Cherry III of the Effards 48381 and Imp. Brittleware Mistletoe 48510.

A little over a year ago these cows dropped calves within a few days of each other and both were placed on Advanced Register test at practically the same time. They have been barn mates during the year and both made records which are high enough to entitle them to be placed among the ten best cows of their age in the breed throughout the United States and to be called class leaders. Imp. Cherry III of the Effards made 15,566.6 pounds of milk and 735.2 pounds of butterfat while Imp. Brittleware Mistletoe made 14,467.2 pounds of milk and 751.4 pounds of butterfat.

Imp. Brittleware Mistletoe will probably place seventh among the class

practicable. The essentials for success in combating the disease, they point out, are interest on the part of hog raisers and knowledge of the disease; organization which will facilitate exchange of information as to outbreaks and secure assistance; serum at reasonable prices and easy of access; and the available service in the community of persons skilled in administering serum.

ords for the United States will be held in California as a number of them have been made here, where the cows have ideal conditions, within the last year. Also some of the finest Guernseys to be found anywhere are now in California.

The record by months follows:

Imp. Cherry III of the Effards			
November	692.2	31.56	
13 days			
December	1403.0	63.98	
January	1277.3	57.10	
February	1132.3	54.58	
March	1377.6	61.99	
April	1363.1	56.04	
May	1357.3	65.42	
June	1327.1	62.24	
July	1207.3	62.90	
August	1295.1	60.87	
September	1194.6	58.54	
October	1288.3	65.06	
November	651.1	34.89	
17 days			

Imp. Brittleware Mistletoe			
December	1475.9	67.30	

Imp. Brittleware Mistletoe 48510

leaders and Imp. Cherry III of the Effards would be tenth if her record was stopped at this time. During the past year the American Guernsey Cattle Club has established another series of classes called the double letter classes in which the cow is required to carry her calf for 265 days of the time she is on test. Cherry has been doing so well that it was decided to continue her for a double letter record. To do this the first part of her record will be discarded and only the last 12 months will be counted. It is expected that her BB record will be about 700 pounds of butterfat which will entitle her to first place in her class and possibly in all the double letter classes, irrespective of the ages. On the day she had been in milk one year she gave 43.4 pounds of milk testing five per cent. She was the first-place cow in the State Dairy Cow Competition for November, 1916 with 1577.4 pounds of milk and 77.3 pounds of butterfat.

Both cows were steady in their production and no re-test was ordered in either case. They are tested by a number of different men from the University of California and by a special tester from the Oregon Agricultural College.

There are now three cows at Hollow-Hill Farm with records ranging from 723 pounds to 751 pounds. It is probable that it is only a question of time until the most of the high rec-

January	1510.7	72.36

### PLANS AND SPECIFICATIONS FOR FARM BUILDINGS

The agricultural extension division of the University of California is issuing a list of blue prints showing plans of barns, poultry houses, silos and other farm buildings. The list may be had for the asking by writing to the university at Berkeley, and once one has indicated the type of building desired the division will send the specifications and blue prints which are loaned and to be returned on completion of the building.

For instance, for dairy cattle barns there is a California type of milking barn with 30 stalls, spaces for feed and machines, details of framing and stanchions. Then there is the California milk house, 12x18 for a 30 to 9 cow dairy. This is of frame and concrete. There are six sheets in this last set of plans. Then there are plans for general barns for swine, horses, sheep, sheds, and feed racks, for poultry houses, for implement sheds, silos and others.

Dairymen and cattle feeders have no better lookout from which to view their feeding operations than the sil-

## Santa Anita Rancho

Anoakia Breeding Farm

**ARABIAN THOROUGHBREDS:** Two-year-olds, sired by Imported Stallion Ibn Mahruss, head of our Arabian stud. Dams are the choicest thoroughbred mares on Santa Anita Rancho.

**SADDLE HORSES:** Some of which were sired by Ibn Mahruss, world renowned imported desert saddle stallion, and Don Castano, a five-gaited Kentucky saddle stallion. These horses are mostly three-year-olds.

**POLAND-CHINA AND BERKSHIRE BOARS:** Four to nine months old. Sired by famous Poland-China herd boars, Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

**HOLSTEINS:** We will sell a number of young bulls. Some sons and grandsons of the noted State Record Cows. Write for details.

## Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

### Milk Fever

We have a good cow but when she came fresh this fall with her fourth calf she got very sick. Before this when she came fresh her udder would be red and swollen but this time that was not the case. I gave a pound of salts before and always give another the next day after calving. The cow seemed all right during the day but next morning was down and with her head turned to the side. She could not get up. We called a veterinarian. He made three visits and each time pumped her udder full of air. She does not seem quite as good as before. What we want to know is how to prevent this sickness recurring when she comes fresh again.—Subscriber, Orange.

Some cows that give a large quantity of very rich milk are inclined to have milk fever at calving time in spite of all that can be done for them. The dose of salts given a day or two before generally prevents it. Some dairymen have adopted the practice of feeding their cows very lightly for a month before calving and in that way have nearly eliminated the trouble from their dairies. It is good practice to feed a cow sparingly for some time before coming fresh and for a week or two after, gradually increasing the feed and getting up to the highest amount about a month later. Cows have become veritable milking machines but there is a limit to their capacity and endurance.

### Vaccination for Abortion

Is vaccination for preventing abortion a success? I have been told that calves, yearlings and the cows should be vaccinated. Will it prevent the disease in a cow that has aborted once? How close to calving time can it be done and how long does it protect them? Also how expensive is it?—Subscriber, Visalia.

Vaccination for preventing abortion has not been practiced long enough to fully determine just how reliable it is. It does not seem necessary to vaccinate young stock until four or six months before coming fresh and not later than one month before. It is not necessary at all unless the disease is established in the herd. It is claimed to cure as well as prevent. When a herd is free from it there is no use vaccinating until some cow should abort and if that is due to an accident there need be no fear that it will affect the others. Sanitary measures are important and that alone is usually enough to prevent the spread of the disease. The expense depends entirely on your veterinarian and the distance he must travel to reach your place. The expense is not great to him so it depends mostly on what he values his time worth.

### Strangles

About a month ago I noticed a swelling at the throat on my three year old mare. It extended up to near the ear and along the jaw. It broke inside and we lanced it in several places outside to help it drain well. The discharge was somewhat offensive and mixed with blood. We have washed it out daily with a pine tar disinfectant and later with crude carbolic acid. The original cuts have healed except the one at the throat. Several other abscesses have formed up about the ear, and we have treated them as the others. Lately the discharge is white and thick. We are not working her. Are feeding alfalfa hay, rolled barley and some tonic powders. What is best to do for her?—Subscriber, Nestor.

The disease is called strangles by

the profession but has been called colt distemper by most people for a long time. It is contagious and most horses have it while young. Some escape and may have it any time later. Those that discharge the most pus from the abscesses usually make the best recovery. The abscesses usually gather about the head but sometimes gather just in front of the shoulder or in the groin. I am inclined to think that you are using the disinfectant too strong in washing out the wounds. Better use pure carbolic acid and put very little in the water. Feed the colt liberally to keep up the physical forces. Half an ounce of the tincture of iron in a pint of water given as a drench once a day for a week is a good tonic to hasten recovery. It may be that some barley beads have worked down into the abscess and in that case the wound should be well scraped out and examined to see if any pockets have formed.

### BUY A PIC

If you want to burn the road,  
Buy a pig.  
If you want to raise the load,  
Buy a pig.  
O, he's little, but he's wise,  
He's a terror for his size,  
And he's quick to advertise—  
Buy a pig.  
If you want the cheapest board,  
Buy a pig.  
If you want to own a Ford,  
Buy a pig.  
He is solemn but he's fat,  
And he knows just where he's at,  
And he always comes to bat.  
Keep a pig.  
He makes sausage, ham and sich,  
Pickled feet and bacon flitch,  
And he makes his owner rich.  
Keep a pig.

—C. L. Bray in Yorkshire Swine Journal.

Everett C. Brown, president of the Chicago Livestock Exchange, recently issued a statement declaring that the corn promise is so great that without war demand the farmer would be lucky to get 40 cents per bushel for the 1917 crop. He asks the farmers to consider the following:

The supply of cattle and hogs is alarmingly short; there will be fewer to feed. The feeding of meat animals is the greatest industry in the country. It is facing a crisis. Not only here but elsewhere meat is short. Europe is depleted, swept clean of its meat animals. It is bare of livestock. There is grave danger that the corn market will go to smash, and at the same time meats, far higher than ever before, will bound to unprecedented prices. Farmers should think this situation over with utmost seriousness.

A Pennsylvania dairyman claims the record for a Jersey which will be six years old next May. On October 24, 1914, she had her first heifer, the mother not being 22 months old. On January 29, 1915, she had another heifer calf, a third one on December 13, a fourth on November 8, 1916. She had a fine big bull calf on October 8, 1917.

The oldest heifer will be fresh in November with her third calf. The second heifer will be fresh in November with her second calf, and the third heifer which will be two years old on December 13 will be fresh at Christmas time.

"The greatest material problem is to bring about the adoption of a system of farming that will restore, increase, and permanently maintain the productive power of American soils."—Dr. C. G. Hopkins.

The use of a weak solution of nicotine in dipping scabby sheep and cattle is approved in an order issued by the secretary of agriculture. This dipping solution differs from that hitherto required, by the elimination of sulphur.

## CUTTER'S BLACKLEG PILLS

"California's Favorite"  
for nearly 20 years

For the Prevention of Blackleg  
in calves and young cattle

Their superiority is due to nearly 20 years of specializing in "Vaccines and Scrums only."

Year in and Year Out they give better satisfaction than any other vaccine made, and the cost of a few cents per dose is cheap insurance against a disease that always takes the fattest and best.

Single Pills may be used for ordinary and range stock.

Double Pills should be used for pure bred and high grade stock.

Use any Injector, but Cutter's simplest and strongest,

Prices:  
10 dose pkge. Single pills \$1.00  
50 dose pkge. Single pills 4.00  
10 dose pkge. Double Pills 1.50  
50 dose pkge. Double Pills 6.00  
Cutter's Pill Injector.... 1.50

Insist on Cutter's. If unobtainable, order direct.

Write for new booklet, "The Control of Blackleg." It tells about Anti-Blackleg Serum which cures Blackleg and may be used simultaneously with vaccine to combat outbreaks and safely protect valuable stock.

The Cutter Laboratory, Berkeley, Calif.

The Cutter Laboratory of Illinois, Chicago  
Eastern Agent

## One Half Bottle Earned Him \$50

READ Mr. McLean's letter. See how one-half bottle of Kendall's Spavin Treatment earned him \$50. The other half of the bottle may earn him even more. Many men make a business of buying lame horses and restoring their soundness with Kendall's. Then they sell at a big profit. How about your horses? Why not get a bottle of

## Kendall's Spavin Treatment

Known For 40 Years as Kendall's Spavin Cure

and be ready to relieve cases of Curb Spavin, Splint, Ringbone, Bony Growth or lameness from bruises or other causes? Thousands of other Farmers are doing it—have been doing it for over 40 years. It's the old, safe remedy you can depend on. Get a bottle at once and see how much it will save or make for you. A drug costs \$1.10 a bottle; 6 for \$5.50. Ask your druggist for book, "Treatise on the Horse," or write to DR. B. J. KENDALL CO., Enosburg Falls, Vt.

Port Wood, Nova Scotia.  
Dr. B. J. Kendall Co.  
Gentlemen: Last fall I bought a mare that I got cheap on account of joint. I tried your Spavin Treatment and a half bottle removed it. That half bottle earned me \$50.00. Very truly yours,  
Lauch McLean.

When writing advertisers, mention the Cultivator.

yield best when planted in December and January. They will do well even if planted later, for they are field-grown and soil-tested—strong and hardy—full of germinating power.

Onion seeds are no good if more than a year old. When you buy Morse's Onion Seeds you are sure of getting fresh ones grown on the Morse farms. The same high quality found in these onions is found in Morse's other seeds for field and garden—from every day kinds to the choicest—by the dime packet or carload lot.

This year of all years, when prices for your farm products will be so high, you can't afford to gamble with poor seed. Buy Morse's and be sure of the best. Write now for quotations on onions, alfalfa, and other field crops.

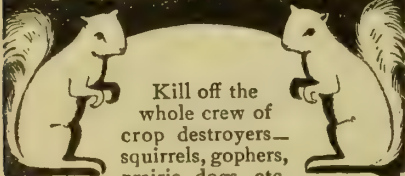

The Morse 1918 Garden Guide is ready—accurate information about seeds, planting, culture and vegetables. Your copy will be mailed free upon request.

729 Front Street San Francisco

At the recent San Francisco Land Show Everett Holliday of Ukiah, California, won the first prize for onions grown from Morse's Seeds.

## Gas 'em!

Kill off the whole crew of crop destroyers—squirrels, gophers, prairie dogs, etc.

Gas 'em with Carbon Bisulphide quick'y, easily and economically.

One burrow of squirrels will destroy more grain than your family can save in fifty wheatless days. Remember—these ground pests cost the farmers of the Pacific Coast more than \$6,000,000 last summer. So be forehanded—be truly patriotic—conserve the seed in your fields.

The University of California says: "From November until the end of February (the rainy season in California) the best way to attack the ground squirrels is to fill their burrows with gas from Carbon Bisulphide."

So too in other states! If the ground is full of moisture, whatever the month may be, Carbon Bisulphide is the best killer of squirrels, prairie dogs, gophers, etc.

A squirrel killed before March is worth a dozen killed later. Because—most young squirrels are born late in March or early in April. So—gas the old squirrels now. Write today for prices and interesting folder telling how Carbon Bisulphide—the profit-saver—works.

## Dr. Coit Los Angeles Farm Adviser

**D**R. J. ELIOT COIT, professor of citriculture in the University of California, and former resident of Whittier, has been named as county farm adviser and agricultural agent. This comes as a result of the successful organization of a farm bureau in the county by Dr. H. J. Webber of the citrus experiment station at Riverside. The supervisors recently appropriated \$3,500 for the expenses of the farm adviser and his five assistants until July 1, the salaries to be

J. Eliot Coit

The New Farm Adviser for Los Angeles County

paid by the state, university and federal government jointly.

Arrangements have been made for the employment of assistant farm advisers who are trained along different lines so that the various interests in the county will be well cared for. Of course, the farm adviser cannot be a

walking encyclopedia, and no man could hope to speak with authority on more than a few phases of agriculture, but the farm adviser is the local representative of the state experiment station and the United States department of agriculture. He has all the facilities of these great organizations at his call and it is his business to get accurate agricultural information in the shortest possible time and then help the farmer on the land to make effective use of it.

Dr. Coit was born in San Antonio and was brought up in the vegetable gardening business, of which business he has an intimate knowledge. He graduated at the North Carolina State College of Agriculture and later went to Cornell University, where he pursued graduate studies, taking the master's degree, and later the doctor's degree under the tutelage of Dr. L. H. Bailey. After two years of service in the Salt River Valley at the experiment station of the University of Arizona, he came to Southern California and served on the staff of the Pathological Laboratory at Whittier, and later as superintendent of the citrus experiment station at Riverside. For the past five years he has been head of the division of citriculture in the College of Agriculture at Berkeley. He is widely known in Southern California on account of his book "Citrus Fruits," which is recognized throughout the citrus world as the standard work on the citrus industry of California.

The supervisors have provided rooms in the court house for the farm adviser and his staff. After conferring with the directors of the farm bureau and the supervisors, Dr. Coit will go to Berkeley to close up his affairs there. He will take up his duties in Los Angeles about the 15th of this month.

## Fertilizing Asparagus Bed

**A**SPARAGUS is a heavy feeder and needs plenty of available plant food, says George O. Greene, in the Kansas Industrialist. The roots are weakened by the continuous cutting of the shoots and need plenty of nourishment to recover properly.

Barnyard manure is the most common fertilizer. On commercial beds this is usually applied in June, after the crop has been harvested, and again in the fall after the plants have been removed and the ground disked or plowed. Barnyard manure is not a complete fertilizer. Market gardeners, almost everywhere, use some commercial fertilizer in addition on the

asparagus beds. Some gardeners, in localities where the manure is not easily procured, do not use manure at all, as it has been found that humus is not essential, though it keeps the soil porous, insuring straight marketable shoots. As a complete fertilizer, the North Carolina Experiment station recommends the following:

250 pounds nitrate of soda.

400 pounds acid phosphate.

160 pounds muriate of potash.

This need not all be applied at one time. A part of this amount is usually put on the field early in the spring and the remainder during the growing season. The essential feature in successful asparagus growing is to

Some Radishes

Here is a war garden production, left over from last year. They are the big white type of radishes. The largest one weighs four pounds and the other is shy only two ounces of it. While we would not advise raising this weight of "fruit" for the table, the Cultivator force sampled one of these and "believe me" it was brittle and far better than one would imagine, with scarcely any tough fibre. They were grown on good soil and had plenty of water. Grown by H. P. Wallace, Los Angeles.

Grow a war garden in which are some radishes.

# BIG SEED COMPANY IS DISTRIBUTING NEW CATALOG

**Aggeler & Musser Seed  
Company of Los Angeles,  
Issue 25th Annual Book**

One of the largest seed houses in the West, the Aggeler & Musser Seed Company, Sixth and Alameda streets, Los Angeles, are about to give their handsome 1918 catalog broadcast distribution, it being the 25th annual book issued by the Company, and it is claimed to be one of the most complete and valuable books of its kind ever published by a Western seed house.

Among the many new features are departments on Home Garden Work, School Garden Work, Demonstration Garden Work and Field Garden Work. In reality, this year's edition combines several catalogs in one, for it also includes "Garden Manual," and surpasses all previous editions. It contains answers to more than 1000 questions and gives invaluable information regarding all varieties of plants listed and is fully illustrated.

Not only does it tell all about seeds, but gives full information concerning the correct tools and implements agriculturists should use to obtain the best results. There are also marketing notes on each subject, telling how and where to market. Most useful hints are also given on poultry, spraying, fertilizing and the use of insecticides.

The Aggeler & Musser Seed Company will send this descriptive, illustrated and interesting catalog free and post prepaid to anyone writing requesting it.

## Make more Money Pull big stumps by hand

Clear your stump land cheaply—no digging, no expense for teams and powder. One man with a K can rip out any stump that can be pulled with the best inch steel cable.

Works by leverage—same principle as a jack. 100 pound pull on the lever gives a 48-ton pull on the stump. Made of the finest steel—guaranteed against breakage. Endorsed by U. S. Government experts.

have an abundance of quickly available plant food which will insure a quick and vigorous growth.

Salt is not a fertilizer. It adds nothing to the crop and is, to a large extent, wasted money when it is applied to the bed. It is said to help in liberating plant food, and in that respect might add something to the bed, but not enough to pay for the trouble of application.

### REPAIR INJURIES TO TREES

The dead wood and crowded branches should be removed. Where limbs have to be removed, cut them with a clean smooth cut, and paint the wound over as soon as possible with a tar or lead paint. Cavities should be cleaned out thoroughly, and all the spongy tissue removed; wash the inside with creosote and fill the cavity with a mixture of one part cement and two parts sand. It requires about three hours for the initial setting of cement. Where large branches appear to be breaking down or where, because of a wide crotch, they are splitting apart, the limbs should be drawn together and held in place with bolts and a chain. Do not use a straight iron rod, since this will not allow the limb to sway naturally in the wind, thus either twisting the rod or splitting the trunk.

In the case of soft wood trees, one may top them or cut off the long slender branches. In cutting, do not allow the falling branches to injure the lower branches. In case some are injured, remove them and repair them before they become affected with fungous diseases. Do not leave long stubs. Cut close to the trunk.

Street trees should be pruned to a height of from 10 to 12 feet above ground. If possible, preserve a central leader in shade trees, as this tends to produce greater strength throughout the specimen.

### AIR SLACKED LIME FOR WEEVIL

Here is a new treatment for beans to prevent depredations of weevil: They are simply stored with air slacked lime, one part, to two parts of beans by weight. A specialist of the Kansas State Agricultural College says:

"Unless beans are treated they are almost sure to be seriously damaged by the weevil. Air slacked lime will not injure the beans either for germination or for food purposes. It can be mixed with the beans when they are stored in the bin or when they are stored in bags. The beans should be treated with the lime directly after harvest."

### MILLIONS WORK FOR US

Certain varieties of soil bacteria or micro-organisms, really a low order of unicellular plants, are associated with a number of necessary soil activities which have to do with the development of available plant food and the successful growth of crops. These include nitrogen-storing bacteria which live on the roots of legume plants and the bacteria which cause fermentation and the decay of organic matter and which are related to chemical changes in the soil by which the plant food is gradually made soluble and available to the plant roots.

### FRUIT NEWS ANNUAL

Mr. Rowley covers the first page of his Annual Review number with the usual red ink. It is, we believe, by far the finest he has ever issued and contains a world of information as to California fruit packing interests.

# Poultry can be made to Pay

**T**HERE are two methods of gaining knowledge, necessary to make poultry a success; experience—which is a long, drawn out, expensive road and the one too commonly used. Another method is by the careful studying of books written by practical poultry people who have made mistakes and successes and are willing to give this information in order that you may take the short road to poultry success.

## Poultry for Profit

BY

Jean A. Koethen

Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on egg-shell book, binding full cloth vellum de luxe.

## My Christmas Goose

Written for California Cultivator By Jean A. Koethen

EVER since away back in the seventies when my old soldier uncle used to read to us little girls about Tiny Tim and the brown, crackly Christmas goose of the Cratchitt family, the goose has seemed to me the desideratum for proper celebration of Christmas, and yet I never tasted goose nor tried to raise one till the past year. One year I bought two settings of eggs. The first proved absolutely infertile. Out of the second one forlorn gosling hatched, but the hen pecked it to death almost before it was out of the shell. Then I began to realize that there were difficulties in the way of hatching goslings and resolved that my next venture should be with goslings already hatched.

I had read alluring stories of the ease with which goslings are raised, their value when they are raised, their long life and immunity to disease, and was delighted last spring to find a Cultivator advertiser who would ship me as many Embden goslings as I wished at 50 cents apiece. How many should he send? I wanted one for Christmas first of all, and one for Thanksgiving; then there must be a pair for breeders, and one for luck. Five was a very good number, sufficient to keep each other warm while they traveled, though I was assured that this was not important on account of their size and vigor, and to give me an opportunity to learn the rudiments of goose culture.

When my five goslings arrived, one chilly evening in the early part of April, I was amazed at their immense size. I hadn't expected anything so large or so strong. I was disappointed that they would not touch the dish of bread and milk I had understood was the proper "first feed" for goslings, and at a loss what to do with them, for I did not quite dare put them under the broody hen I was counting on to mother them unless I was by to see how she treated them. A box was hastily prepared with straw for bedding and a warm blanket for covering, and they were left in the kitchen for the night. I know now that they were cold, for they kept talking and refused to quiet down, but I was so filled with the notion that goslings do not need the warmth chicks require that I let them talk. In the middle of the night I was awakened by a strange sound in the dining room, which adjoined my bedroom, and there was the largest and strongest of my goosey-ganders, walking and talking. I put him back to bed, but there was no rest for any of them. The next night, and a good many nights thereafter, they had a jug of hot water in their box and slept in comfort in the feed house. The broody hen, when she saw what big, ugly creatures they were, absolutely refused to take them, and I shall never again offer such a brood to a hen. A jug of hot water makes an excellent mother, but some heat they must have.

I had read that grass was about all the food goslings need at first, and the lady from whom I bought mine, when I asked how she fed them, replied, "Any kind of ground grain will do." Did she mean moist mash or dry, one grain alone or several mixed? I could only experiment. I put them in a coop on the lawn so that they might have grass if they preferred grass, and offered them several times

a day, bran, corn meal, middlings, and bread crumbs, both wet and dry, but they would eat neither grass nor grain nor crumbs. Finally I began to understand that in spite of their size and strength goslings are very like baby chicks and want nothing the first few days but rest and warmth. One gosling was the price of this knowledge, for the smallest of the five had not looked just right when he was taken from the box and quickly succumbed to the Spartan treatment I gave it. After a few days they began to eat, but were slower than chicks in acquiring an appetite. Then I tried mash again, both wet and dry, but finally settled down to the wet because they wasted it less, and a mixture of bran or shorts and corn meal. It was some time before they learned to care for grass, but by the time they were a month old they were ready to nip every green thing that appeared in the garden. I owe the failure of my war garden, I suspect, to the presence of these goslings, but it was a long time before I could make up my mind to confine them. When I did they consumed mash in such an alarming fashion that I wished I had another garden to turn them out on.

One gosling had fallen a victim to misinformation. Another was sacrificed to carelessness. I had read, but had forgotten, that goslings cannot stand rain until they have feathered out. When they reached the age at which heat could be dispensed with, I put them in an A-coop in the lath house. A sudden shower one night gave them more or less of a wetting, and gosling number two drooped and died. I know now that goslings, while they do not take cold as chicks do, and are not subject to bowel trouble nor as easy victims of lice and mites must still be carefully protected the first three weeks, and kept in out of the rain until they are quite well grown.

The three remaining goslings were now kept confined and fed a moist mash three times a day. How they did grow, and how they did eat! I couldn't get the words of the old song out of my head:

Oh, the elephant ate all night  
And the elephant ate all day,  
Do what he would to get more food  
The cry was still more hay.

They were always ravenously hungry, and my sacks of ground grain disappeared with appalling rapidity. To make a long story short, by the time those goslings were three months old, they weighed from ten to 12 pounds apiece, but were eating us into the poorhouse. With Thanksgiving four and Christmas five months away, there was only one thing to do, get rid of them at any price. Then came my crowning disappointment.

On calling up various wholesale and commission houses I found there was no market for geese of any kind at that season. One man offered me ten cents a pound. Others would not have them at any price. A friend came to the rescue and offered to take one and find a customer for another. I let him have them for a dollar apiece and the third made a delicious Sunday dinner for the family. It took two of us half a day to pick it, and Mrs. S. who had the fun of picking one of the others, said, "Never say goose to me again." They are wonderfully fine when once the feathers are off, and there may be an easier

way of picking them than we found, but I suspect the time it takes to prepare a goose for the table is one of the reasons it finds a less ready market than chickens.

My goose experiment was a disappointment but by no means a failure. I have learned that the goose is a bird which cannot be profitably raised in small quarters. If given adequate pasture it would, I am sure, be immensely profitable, for what other bird can compare with it in rapidity of growth? A bird that can reach 12 pounds weight in three months has great possibilities, but it should be hatched earlier or later than I hatched, so that it may go on the market when there is some demand for it. Geese hatched in January should find a better market, and if it were possible to hatch in September (which I fear it is not) they would just reach marketable size at Christmas. I shall try again. We had no goose for dinner this Christmas, but there will be other holiday seasons, and perhaps some day I shall find the little farm with the right kind of pasture.

### POULTRY ASSOCIATION WILL MARKET OWN PRODUCT

The Central California Producers' Association now proposes to eliminate entirely the middleman. It also proposes to handle during the next year \$2,000,000 worth of eggs and poultry.

The products are to be marketed without association with the Producers' Exchange and will, when possible, be sold direct to retail dealers, as the result of action by the federal food administration, which has ruled that the Poultry Producers' Association is no longer entitled to a seat on the exchange.

E. A. Forbes, secretary of the state market commission, says many benefits will result. "The plan was tried with success in Los Angeles, and we hope to profit by their experience," he said. "Large numbers of poultrymen have been going out of business because of the high cost of feed and the prices they have received from the commission men were too low to cover their expenses."

### The Best Feed on the Market

Has the highest protein at the lowest price \$2.90 per 90-lb. bag, subject to market changes; see that your hens eat as much Dry Mash as they do grain; feed them lightly of grain in the morning and make them work for it; either have a scratching pen or spade up a part of the ground and rake the feed under; keep "A-1" Dry Mash in a dry form before them all day; about one hour before feeding them their grain in the evening WET their Mash and let them eat all they will; put it on top of the Dry Mash, then feed them all the grain they will eat; this stuffing process will give them a full crop to carry them through the long night of inactivity; analysis is printed on every bag; give it a trial. ## The Small Tractor

**W**E note the following hearty endorsement of the small tractor by a writer in the "Breeder's Gazette".

One of the greatest problems among farmers is that of farm labor and power. Perhaps a solution lies in little farm tractors. Heretofore these machines for the most part have been designed and built on too large a scale for small farmers. Where the acreage has been big and practically level, they have been doing a world of good; they have been the forerunners of the smaller machines to serve the needs of the average farmers. These small tractors, which will go almost anywhere a team will travel, are chugging merrily, plowing, fitting the soil, seeding the grain and harvesting and threshing. In many communities, on big ranches and estates, whole batteries of these little tractors are in use. The little tractor has important advantages over the big machine, principally because of its small cost. It is lighter and will not pack the soil. Its sphere of work is unlimited. It can plow, disk, harrow, haul, cultivate, and do almost any kind of work on the farm. It is more economical in labor required to run it and uses less fuel and oil. It requires no mechanical engineer. Little tractors are practical for the small farm. The practical man, however, never goes to extremes, and while he may have some time ago put some money into a big machine he has not been so foolish as to have sacrificed it for the smaller tractors. The chances are that he has kept it to do his heavy belt work, such as threshing, corn husking and silage cutting, although the little tractor is doing this kind of work also, only on a smaller scale.

Not only is the little tractor helping to solve the problem of labor and

horsepower for the farmer, but its advent is improving farm lands, just as the automobile brought with it an improvement in the way of better roads and highways. It is easy to see that in order to receive the maximum efficiency from the use of these tractors fields must be arranged systematically, stones, stumps and other obstructions removed, gullies and low places filled in and a general clean-up of the fields affected. One of the handicaps to the more rapid introduction of these tractors has been the fact that up to recent years the farmer has not had sufficient mechanical training and ability to keep the machines in repair and adjustment. Happily, however, this situation is changing. Moreover, the actual running of a tractor is easier than an auto, because its motion is slow and deliberate, and opportunity is given the green hand of becoming accustomed to the wheel. The motor of a tractor is easy to start because mechanics know that the larger the cylinder and the greater the compression the easier the charge of explosive mixture is drawn into the cylinder and fired.

On some ranches in the West all the plowing and fitting of the land is done with batteries of tractors, run by day laborers, who are paid to sit in the seat and steer, one repair man being employed to make all repairs and adjustments. In many instances the tractor has saved the owner its cost in a single operation. Not being entirely satisfied with making tractors simple in operation, over which one man or intelligent boy has entire control, manufacturers are now even making them with self-steering devices without the necessity of having an operator in the seat. These devices are especially valuable in plowing, as the wheel of the steering device follows the furrow closely, and a neater and better job can be done.

## Tractor Care Pays

Upkeep as Important as Purchase. Samson Siftings Gives Points of Care

Be careful in the selection of a tractor—get one that fits your work. In starting the tractor never put a full load on it for the first few days; put the load behind it gradually, for when a machine is new it can easily be damaged by endeavoring to run it to full capacity.

Be careful of lubrication—lubricate each moving part often. A little lubricant often is better than a lot at one time. Select the right lubricant and be careful to keep this lubricant clean. This can be done by using a receptacle with a dust-tight cover. It is hard to get dirt out of bearings, and a little dirt in a bearing will do more damage in an hour than a season's normal wear. Apply the same thing to oil. Oil should be clean and free from lint before putting it into the motor. Good motor bearings will run a season without adjustment, providing the lubrication is sufficient and free from dirt.

Never overload a tractor. The manufacturer places a rating on every machine turned out. Nearly all tractors will pull an overload, but if this reserve power is maliciously used, parts will break, bearings get hot, the tractor won't handle easily and will cost the owner that which he bought the tractor to save—money.

In regard to the hostler work which is necessary on all tractors; it will be found most convenient to do this work at night, because the tractor being warm, the bearings will take grease more readily. Another thing—the operator has more leisure at night

than he has in the morning and won't neglect some needed adjustment at that time, while in the morning the operator is usually anxious to get out into the field.

Always handle your tractor with as much consideration as possible—never make a turn shorter than necessary; don't jerk your machine around, but have a little respect for its mechanism. Simply because it is of metal is no reason it can not be strained or broken.

### STATE A. P. A.

The California branch of the American Poultry Association recently met at Coalinga and elected A. A. Bamford of Gardena, president; L. C. Byce of Petaluma, first vice-president; P. D. Mercer of Los Angeles, second vice-president; Henry Kruckeberg of Los Angeles, secretary; M. E. Dillingham of San Gabriel, treasurer, and C. G. Hinds of Oakland, Chas. R. Harker of San Jose, A. H. Currier of Santa Rosa, Ben Woodhull of Stockton, and F. H. Green of Modesto, directors.

### STATE POULTRY ASSOCIATION ELECTS OFFICERS

The California State Poultry Breeders' Association has elected the following officers for the coming year: President, F. H. Green of Modesto; vice-president, R. V. Moore of Oakland; secretary-treasurer, C. A. Wilkins of Sacramento; directors, C. G. Hinds of Oakland, C. T. Walker of Coalinga, L. B. Cary of Reedley, and W. H. Hocking of Los Angeles.

## Note What It Does

IN ORCHARDS IN VINEYARDS

## This 15-Feature Tractor Will Almost Run Your Place

**15 FEATURES**— invaluable in orchards and vineyards—make this the needed tractor.

No other tractor of the track-laying type sells at so low a price. And no other has such advantages as the patented front drive.

### Handles Like Horses

The Bean TrackPULL Tractor turns clear around inside a 10-foot circle (5-foot radius), and it has full power even on so short a turn. It plows and harrows close up in the corners, and right up to the trunks and vines. It goes under tree-branches only four feet off the ground; and works between 7-foot rows in vineyards. On account of the patent principle and simple transmission, the fuel consumed is far less than other types doing the same amount of work. When you hit soft spots or holes, you simply swing the track over and pull out as you do with teams.

When not in the field this trac-

tor's 10 h. p. pulley runs your stationary machines.

### A Great Patent

The Bean TrackPULL is different from all other tractors in that it pulls instead of pushes itself along; and you steer with this track that pulls. That is why the Bean can be "gee-ed" and "haw-ed" like a team. This feature is patented so no other tractor can provide this big advantage. Sooner or later you'll decide, without doubt, that you want a tractor to do these things.

### Know First—Then Decide

So don't buy a tractor until you know all the facts about this remarkable agricultural aid.

The Bean TrackPULL Tractor pays for itself in what it saves for its users. It weighs less (3100 lbs.) and costs less to operate than wheel-type machines of equal power. And yet it has greater traction. The pressure per square inch on the soil is less than a man's foot.

Before you turn this page send for full information about the Bean TrackPULL Tractor.

## BEAN TrackPULL Tractor 6 H. P. at Drawbar

Price Now \$1215

This price is the very lowest for any track-laying tractor built.

But material costs are rising every day because of the great demand for metals. Our low price therefore may have to be withdrawn without any further notice.

Mail the coupon for our new catalog; the most interesting tractor book in print.

Sending the coupon doesn't obligate you. It simply brings full information.

### GEESSE

**Mammoth Geese**, the kind you want Stock for sale. Chas. McNeely, Alpaugh, Cal.

### HOGS

**The Billiken Brand of Chester Whites**—Entirely sold out of bred sows and gilts. Have a few open gilts of March and April farrows; also 6 boars, same age. Have 9 young tested sows to offer for late December shipments. These have each farrowed once and will be bred for a late March or early April farrow. Fall pigs, both sexes, now being weaned and will be ready for delivery during December. Good breeding stock is getting very scarce and rapidly increasing in value. If you want some of this easy feeding, melon-type, get busy with your orders. C. B. Cunningham, Mills, Cal.

**Grape-Wild Farm Berkshires**—World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

**Four Good Boars** ready for service is all I have left out of the twenty I had six weeks ago. These are the low down, big bone heavy ham kind that will just do a world of good in that pork producing herd. They are worth \$100 but \$50 is the price shipped on approval. Less than two months until the big Kings County Poland-China Sale. Bernstein sells twenty sows that are real BEAUTIES. They will please you. Bernstein's Ranch, Hanford, Kings County.

**Superba**, World's Grand Champion Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

**Berkshires**—First prize junior boar; first and second senior boar pigs including junior champion; fifteen spring and fall open gilts sired by Ames Rival 115, champion boar; and two junior yearling bred sows priced cheap for immediate sale. F. D. Hall, Perris, Cal.

**We Pay Cash for Hogs of All Sizes**, weights and breeds. Any number from one to several thousand considered. What have you? Durbin and Forbes, 722 San Fernando Building, Broadway 4170, Los Angeles.

**Big Type Durocs**—Well grown out February and March pigs of either sex in any quantity. We ship only the tops and butcher the culls. F. M. Johnson, Napa, Cal.

**Most Money in Duroc-Jerseys**—Bred sows and weanlings, either sex all the time. Delta Farm and Live Stock Co., Colton, Cal.

**Large Yorkshires**—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

**PLW Durocs**—Eastern selections made by R. K. Walker in January. Peters, Lamson & Walker, Devore, San Bernardino County.

**Large Type Poland-Chinas** are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, Cal.

**Rancho Rubio Durocs** all sold out except some choice fall boar pigs. Write for prices. Elmer Lamb, Ceres, Cal.

**Greenwood Farm Durocs**—"Size with Quality." H. C. Witherow, Palo Cedro, Shasta County, Cal.

**Berkshires**—Sired by Star Leader, the \$1,500 boar, ready for service. Kounias Registered Stock Farms, Modesto.

**Durocs**—P. & L's Defender by Defender heads herd. Joseph Prendergast, Route 2 Box 87A, San Bernardino, Cal.

**Registered Durocs of the big type**—Cholera immune. Derryfield Farm, Odd Fellows Building, Sacramento, Cal.

**Carruthers' Farm Berkshire Hogs**—Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

**Poland-Chinas**—A few good breeding boars. S. F. Williams, Orland, Cal.

### ENGINES

**Several New and Slightly Used Engines**, ARNOTT & CO., Implements, 112 S. Los Angeles St., Los Angeles.

### CATTLE

**WASHINGTON HOLSTEINS**  
We will sell twenty splendid heifers, granddaughters of King of the Pontiacs, from A. R. O. dams with semi-official yearly records up to 598 pounds for junior two years, 670 pounds for the junior three years and 813 pounds for mature cows, which records were made under practical dairying conditions. These heifers range in age from five months to twenty-nine months. Those of proper age have been bred to a 33 pound bull. They are from fine large cows and should be heavy producers. The oldest are due to freshen in February.

Prices range from \$350.00 to \$600.00 each with a proper discount on sales of more than one animal. A substantial discount will be made on a sale of all to one customer.

THE GREENBANK FARM,  
800 Leary Bldg., Seattle, Wash.

### OREGON JERSEYS

**Bull, Fussy Fern's Noble Boy**, Junior Champion, his dam also first prize State Fair, R. of M. 488 lbs., other bulls for sale, whose dams have made up to 1040 lbs. There is butter in these pedigrees. Write for one.

Reld Stock Farm,  
Second Floor Wilcox Bldg.,

## READ!

Gather the knowledge of thy life's vocation  
Where'er thou find'st a gleaner ne'er so poor:  
Read thou! Thy lesson shall in Time's probation,  
Ripen thy mind, which, fruiting, shall secure  
Thy place in honor, peaceful and assured.  
This day is thine, but night comes quickly on:  
Though pleasure must have way, be not allured  
From Wisdom's pages ere thy day be done.  
—A. H. McQuilkin, in the Inland Printer.

## WHEN THE STORM CAME

By Laura Tilden Kent in Youth's Companion

THE sky was growing cloudy and dark in the early afternoon, and the little black and white cow knew that a storm was coming. It made her feel restless, and she walked nervously round and round the pen when her calf was shut away from her "Try to get out! Come with me!" she seemed to be saying. "Hurry! A storm is near!"

Finding that her calf could not take her advice, "Bossie" walked away from the pen. Soon she went trotting down the road.

Mary and Ted had been watching the cow for a long while. "I'm afraid that Bossie is going to run off," they said.

"Yes," said their mother, "every winter these countain cattle go down into the valley where it is warm. Their instinct tells them when to go, and Bossie thinks that now is the time."

"She won't leave little Spot," said Mary.

"I'm afraid that she will," said mother, as she looked anxiously down the road.

Spot was bawling sadly in the little corral but Bossie trotted straight on, without looking back.

"Let Mary and me go and drive her back," offered Ted. "She has not gone very far."

When their mother had given her permission, the children went out into the chilly air.

But Bossie would not be driven back. The faster Mary and Ted hurried after her, the faster she trotted; with her head bent forward she ran straight on down the stage road at a rapid rate.

After a time Mary and her brother left the road, and ran through the bushes; they tried to pass Bossie and to come back into the road ahead of her. But Bossie, watching them from the corner of her eye, turned from the road herself, and trotted up to three cows that were walking about uneasily under a big pine tree. When Bossie came up, they all ran off together.

The cows no longer kept to the road, and so the children ran out into the woods and tried again to get ahead of her. They had a great chase after her over stones, and through little thickets, and round wild heaps of great rocks; but Bossie and the other cows were always far ahead. "We may as well go home!" said Ted, who had become discouraged.

"Look at the clouds! There's a storm coming and we must hurry back as fast as we can!"

"We must go home!" cried Mary. The sky was gray, and it was growing quite dark in the woods. Sometimes a snowflake came drifting down through the frosty air.

"Yes, we must hurry!" said Ted.

The children turned and began to run back along the way they had come; but they soon grew frightened. They could not find the road.

"It ought to be here!" faltered Ted.

It was getting darker all the time, and the stray snowflakes came down thicker and thicker. All the little pine thickets, the great heaps of rocks, and the stunted oak bushes looked alike.

"We are lost!" said Ted, at last.

"We—we must find the road!" quavered Mary.

They went on, running when they could, walking when they were too tired to run, growing more and more frightened as the darkness came on. Suddenly they heard a sound! A heavy wagon was stuck in an icy hollow on the stage road, and the driver and his helper were cracking their great whips and shouting to their six balking mules.

Ted and Mary did not quite realize what was happening, but they heard human voices a long way off, and they felt better.

"We're lost! We're lost!" they called as loudly as they could.

A voice answered them: "Where are you?" and with the voice there came the sound of hurried steps.

"Here!" they cried together.

Mary and Ted hurried on, and presently they met their father, crashing through the bushes.

A few minutes later they had climbed a steep hill and were on the old familiar wagon road again.

It was almost pitch dark now, and the snow began to come down in whirling clouds, but Ted and Mary did not care. They tramped wearily but happily along, each holding one of father's hands, and coming nearer and nearer to home, a hot supper, and—mother!

Bossie, who had caused all the trouble, must have missed her calf in the night, for the next morning she was back, huddled in the snow outside the corral; and she seemed glad to be put into a warm barn where she could eat all the hay and bran that she wanted.

## HIPPO DESCRIBED

Johnny, who had been to the circus, was telling his eacheer about the wonderful things he had seen.

"An' teacher," he cried, "they had one big animal they called the hippo—hip—"

"Hippopotamus, dear," prompted the teacher.

"I can't just say its name," exclaimed Johnny, "but it looks just like 9000 pounds of liver."—Youngstown Telegram.

## A MARATHON

## The Cultivator Patterns

8672—Girls' Coat. Cut in sizes 4, 6, 8, 10, 12 and 14 years. The coat is in double-breasted effect, and the large pockets have pointed flaps buttoned at the top.

8679—Ladies' Waist. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The waist closes at center back, and the front is all in one piece.

8457—Ladies' Waist. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The fronts are gathered to the edges of the back which extend over in yoke effect.

8452—Ladies' Apron. Cut in sizes 36, 40 and 44 inches bust measure. The bib fits smoothly, and the skirt section is three-gored.

8658—Ladies' One Piece House Dress. Cut in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. The dress is in one piece from shoulder to hem, but there is a casing run through with elastic which holds the dress in at the waistline.

8676—Girls' Dress. Cut in sizes 6, 8, 10, 12 and 14 years. The dress has a plain little waist in Empire effect, and the straight, one-piece skirt is gathered to the waist.

8448—Ladies' Two Gored Skirt. Cut in sizes 24, 26, 28 and 30 inches waist measure. The front gore fits smoothly, and the back gore is gathered to the slightly raised waistline.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

### HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

## Breakfast Marmalades

These Are Made From Sweet Fruits That Need No Sugar

As a butter saver Americans might adopt the English custom of serving marmalade with toast or hot bread for breakfast. Let the fruits supply the sugar to be used in making these marmalades. Their virtue lies in the tartness of the fruit and the fact that they contain only what nature put in the fruits.

### Apple-Raisin Marmalades

To one cup ground seeded raisins add one cup chopped apples and one cup water. Cook until thickened. A little orange and lemon juice and grated rind may be added if liked.

Cooked dried fruit, as apricots, pears, peaches, or prunes, may be used in combination with the ground raisins in any proportion desired, and

three fruits combined, as apricots, apples and raisins.

Catsup added to the marmalades makes a simple fruit relish to serve with cold meat.

### Date-Prune Jam

Wash one pound prunes, soak over night; cook in same water and remove stones. Remove stones from one pound dates and cut in small pieces. Cook with prunes until mixture is thick. Add small amount of lemon juice.

### Prune-Apricot Butter

Wash one pound prunes and one-half pound apricots; soak over night; stew until very soft in same water; rub through colander; return to sauce pan and cook slowly until thick like apple butter, being careful that it does not burn. Do not add sugar.

## Economical Rugs

Written for California Cultivator by Ellen J. Cannady

RUGS have so many advantages over the old-fashioned carpets, that we cannot help wondering how we endured these heavy, dust-gathering floor coverings so long. Perhaps we cannot have the Wilton and velvet rugs that look so tempting when displayed upon the racks in the furniture stores, but there are a great many home-made rugs that are artistic and durable.

### Home-made Carpet Rugs

If you have an ingrain carpet that is too much worn for further service, dust it thoroughly and cut it in strips one and one-fourth inches wide. Ravel the threads about one-fourth of an inch on each side, sew the strips together and wind them into balls. A carpet weaver will furnish the chain and weave them, making them any size you wish. Some firms take the old carpet just as it is, clean, ravel and weave it, and return the finished rug to you. Small rugs are usually preferred to large ones because they are so much easier to handle. These rugs are especially suitable for the dining room and living room and are handsome enough for any home.

### Rag Rugs

The most popular rugs, however, are those made of the rags that accumulate so rapidly in every home, prepared and woven like the old-fashioned rag carpet, except that they are usually made heavier. The expense connected with making them is so little that there is no reason why any housekeeper should not have as many as she wishes, and they will do a great deal toward making a room look cheerful and home-like. Save the rags until you have enough for the rugs, and if they are to be made with hit or miss centers of every color, use the short lengths for them, mixing them thoroughly before you begin sewing so the colors will be evenly distributed. Tear the rags in strips, the width depending upon the materials used.

The sewing may be done on the machine, lapping the ends of two pieces and stitching across, then stitch the next two pieces without raising the machine foot. When you have finished, cut the threads and wind into large balls.

Bright colored borders are used across the ends of the hit or miss rugs, and it is well to use the white rags for these, dyeing them the colors you wish with diamond dyes. A shaded

border of red and green is pretty for a dark rug. Outlining the border with a narrow strip of black adds greatly to the effect, and these stripes may be made of old stocking legs, cutting them round and round, making a long spiral one inch wide of each one.

Clouded effects are desirable for the borders of rugs if the centers are plain. Use white rags for them, making them into skeins, then bind bands of rags around each skein in two or three places before dipping in the dye. The part that is bound will be

lighter in color than the other. It is not necessary to stir them when they are put in the dye for you do not wish them an even color.

In a living room with mission furniture, shades of brown and tan are pretty, especially if the walls are tan or brown. Blue, old rose, pale green and lavender are pretty in the bedrooms, and nothing is more suitable for them than these light colored, light weight floor coverings.

### HULLED CORN BETTER THAN HOMINY

#### A Chino Subscriber Tells How to Make It

Noticing in a recent issue of the Cultivator a rule for making hulled corn, I venture to send a recipe given me by a neighbor. Take two cups of kaffir corn and wash thoroughly; soak over night in cold water, adding a teaspoon of soda. In the morning drain and rinse with cold water; put in kettle large enough to allow for swelling and add boiling water; bring to a boil, then cook slowly for four hours; season with salt and a lump of butter. We like this with meat and gravy, but many will enjoy it with sugar and cream. It tastes like hominy, but is more tender.—E. M. H.

### LOOK PLEASANT

A gloomy face is ungentle. Nobody cares about your woes; Each has his sorrows, goodness knows, Why should you your grief disclose? Look pleasant!

"Though you are blue as indigo— You're prettier when you smile, you know.

The world abhors a gloomy face, And tales of woe are common place— So let your face no sorrow trace— Look pleasant."

—Attainment.

## After a Hard Day's Work—

WITH the chores done, the stock 'tended to, everything ship-shape and air-tight for the night—

It's pretty nice to settle down to supper with a steaming cup of Ghirardelli's at your elbow. Pretty nice and warm and comforting!

And in the morning—up early (what with help so scarce!) and a hundred and one things to do—it's right comforting to know that Ghirardelli's will be there at the breakfast table to greet you.

A delicious, sustaining food-beverage—drink it every day for health and economy.

In ½ lb., 1 lb. and 3 lb. cans; a tablespoonful—one cent's worth—makes a cup.

D. GHIRARDELLI CO.

Since 1852

San Francisco

Ghirardelli's  
Ground  
Chocolate

## Do You Like Horse Beans?

**H**AVE you tried cooking the green pods of Horse or Broad Windsor beans? Below we give method of cooking them used in the Barbados Islands—surely a quick and easy one and worth trying.

The first is for cooking the young pods as French beans. The pods should be picked when they are not more than about six inches long. To avoid their turning an ugly color in boiling, they should be sliced thin into a bowl of cold water, and whenever the knife used shows any stain it should be wiped clean on a damp cloth. Throw off the water in which the pods have been sliced, put them

into fresh cold water and let them stand there for about ten minutes. Then put them on in still another lot of water, with a pinch of soda added, to boil. They ought not to be boiled longer than about three minutes.

The second recipe is for cooking the dry beans, the only drawback to which is their tough skin. Put the beans into cold water with about half a teaspoon of soda added. As soon as they begin to boil take out the beans with a spoon and drop them into cold water immediately. The skins can then easily be pulped off. Put the beans back into the water with the soda, and boil until cooked, which takes, however, a long time.

## Simple Home Remedies

Written for California Cultivator By Martha

**A**N excellent liniment for muscular rheumatism, stiff joints and sprains is made with one pint each of spirits of camphor and neatsfoot oil and one half pint spirits of turpentine. Shake the bottle well before applying and use three times a day, rubbing in all you can for 30 minutes each time. It is said that rheumatism can find no foothold in a system fortified by olive oil. It will sometimes cure nervousness, and has a quieting effect in cases of neuralgia and neuritis. One teaspoon three times a day is the dose if the victim of neuralgia, anemia or disordered nerves is in a hurry to be cured.

When you have neuralgia, wet a cloth with strong camphor, lay it over a hot flatiron and hold it against your face, then cover your head with a shawl and breathe the steam as long as you can. This has given relief in ten minutes.

A roasted or baked lemon, filled while hot with pulverized rock candy

or sugar, and eaten while hot, will induce perspiration, relieve hoarseness, and often break up an incipient cold.

If you have a box of boric acid powder you can make some excellent home remedies at very small cost. The powder mixed with vaseline in equal parts makes one of the best remedies for piles or hemorrhoids or for old sores of any kind, and one of the best remedies for chapped skin is made by melting a teacup of mutton tallow and stirring in a level tablespoon of the powder until well dissolved. Then remove from the stove and stir in a little spirits of camphor and pour back in the teacup to harden. When needed warm and rub well into the skin. There is no better home remedy than borated glycerine, made by warming glycerine and stirring in the dry powder until entirely dissolved. The proportion is five parts by weight of the powder to ten parts of glycerine. This is fine for wounds, cuts, burns or bruises. Three parts of rosewater mixed with one part of glycerine makes a most agreeable cosmetic.

## Measures in Cooking

**H**OUSEWIVES not in the habit of cooking for large families often hesitate to use recipes calling for large amounts. It is a simple matter to divide such recipes, even into eighths, and usually with quite as satisfactory results as though the original recipe were followed. For instance one cup holds 16 tablespoons, eggs may be beaten and measured by the teaspoon or tablespoon, etc. The following tables may be helpful to those who find difficulty in dividing recipes.

### Measures

- 60 drops equals 1 teaspoon.
- 3 teaspoons equals 1 tablespoon.
- 1 cup equals ½ pint.
- 4 tablespoons equals ¼ cup.
- 1 round tablespoon butter equals 1 ounce.
- 1 solid cup butter, granulated sugar, milk, chopped meat equals ½ pound.
- 2 cups flour equals ½ pound.
- 9 large eggs equals 1 pound.

### Proportions

- 1 cup liquid, 3 cups flour for bread.
- 1 cup liquid, 2 cups flour for muffins.
- 1 cup liquid, 1 cup flour for batters.
- 1 teaspoon soda to 1 pint sour milk.
- 1 teaspoon soda to 1 cup molasses.
- ¼ teaspoon salt to 1 quart custard.
- 1 teaspoon salt to 1 quart water.
- ½ teaspoon salt is a pinch.
- ¼ square inch pepper is a shake.

### How to Measure an Ounce

Housekeepers are often confused by the mingling of weights and measures in a recipe, therefore an accurate schedule is a good thing to have around. The following of the most generally used articles will be found correct.

### STEAMED BROWN BREAD

#### Another Way of Using Dry Bread

A San Diego subscriber sends this one:

After reading your very helpful articles on "Old Bread," I would like to contribute a good recipe, tried many times, and always to the satisfaction of my family:

One cup yellow cornmeal, one cup bread crumbs, two cups sour milk, one teaspoon salt, one teaspoon cooking soda, two large mixing spoons molasses. Steam three hours. This is splendid.

I use my pound baking powder cans for steaming the bread, and this recipe should be enough for three. Of course, in filling cans allowance must be made for rising.

The most careful person will sometimes scorch an article when ironing. The next time this happens take a clean cloth, dip it into a solution made of nine parts water, one part peroxide, place it over the spot and press it with a warm iron until the cloth is dry. The ugly brown spot will disappear as if by magic.

## We Must "Follow-Up"

The story of the Gallipoli withdrawal is a tale of inadequate support. Like Salamanders clinging to the red-hot bars of a fiery furnace, the boys of Australia and New Zealand clung to the slopes of Anzac. Desperately, heroically they clung. No troops under any circumstances ever displayed greater soldierly qualities or upheld more sacredly the best traditions of England's Army. But they had to withdraw because the "follow-up" was not there.

To some of us it has been given to march with the columns of troops that go to France. And to others it is given to wave God-speed. But he who marches and he who stays is equally a citizen

of the world's mightiest republic and equally responsible for its success in this greatest of undertakings.

Then let us at home turn from our flag waving and consider how necessary we are, how useful we must be. Those who go to fight cannot hope to win by naked bravery and we cannot hope to win unless every individual at home does *all* he can. We must have no Gallipoli.

The Bell System is only one of the myriad great and small industries which are co-operating that nothing be left undone to keep a constant, efficient stream of men, guns, ammunition, food, clothing and comforts flowing to the front.

pound head rice, 6.45@6.65; brewers, 5.10;  
screenings, 5.37½.  
Rough rice, 100 lbs., 3.50@3.60 to grow-  
ers at shipping points.

## HAY

Under date of January 5, Scott, Mag-  
ner & Miller says:

Receipts of hay for past week were  
1411 tons. A large part of these arrivals  
have been for government account for ex-  
port to the Philippines and Hawaii. That  
part for local consumption has been small  
with the result that the market has been  
very firm and although no increase in  
prices can be noted there has been no dif-  
ficulty in moving receipts at our top  
quotations. An order for 50 carloads for  
shipment to New Mexico was placed dur-  
ing the week. Troops are being ordered  
to Camp Fremont and without doubt  
some hay will move in this direction  
shortly.

The lack of rain is very serious. Stock-  
men are complaining bitterly of the lack  
of pasturage, and baled hay has been  
shipped to all sections in order to keep  
cattle from starving. Unless rains come  
very soon conditions may be worse than  
we have seen for many years. Stocks of  
hay on hand in the country districts are  
being drawn upon very heavily and  
warehouses are showing the result.

There is nothing new in regard to the  
food administration in Washington and  
the placing of more or less restrictions on  
the hay trade. This is looked for short-  
ly and without doubt will have consid-  
erable effect. It is understood that all  
dealers will be licensed and will have to  
make monthly reports of stocks on hand,  
sales, etc., to the food administration.

There is little movement in straw, al-  
though much rice straw has been ar-  
riving. The alfalfa market is very firm  
under a heavy demand.  
We quote today wholesale prices in  
carload lots as appear from dealers'  
transfers. For prices to consumers  
charges of cartage, commission and han-  
dling must be added according to condi-  
tions.

Fancy Wheat Hay  
(light 5 wire bale) .....29.00@30.00  
No. 1 Wheat or Wheat and  
Oat Hay .....26.00@28.00

## GRAIN

Grain Exchange prices, ctt.  
Corn, Cal. Yellow, cwt. ....3.30@3.40  
W. Egyptian, 3.20@3.25; Brown 3.05@3.10  
Barley, Feed & Brewing, cwt. 2.85@2.87½  
Milo .....3.05@3.20  
Oats, Red Seed .....3.00@3.25  
Feed .....2.77½@2.85  
New Black .....3.40@3.60  
Wheat—Government prices: Common  
white hard, base price is \$3.50 per centar-  
or \$2.10 per bushel of 60 pounds deliv-  
ered in terminal warehouses in bulk; soft  
wheat, base price 2 cents per bushel less,  
or \$2.08 per bushel; white club (including  
Sonora), \$2.06 per bushel. If wheat, af-  
ter cleaning, weighs 60 pounds or more to  
bushel, base price stands; if 58 to 60  
pounds to bushel, 3 cents per bushel re-  
duction; if 56 to 58 pounds, 6 cents per  
bushel less; if less than 56 pounds, grain  
becomes sample grade and sells on its  
merits up to within 1 cent per bushel of  
56-lb. wheat. Sacked wheat 4 cents per  
bushel more, less tare for weight of  
sacks.

Rape .....2½@3

## Citrus Fruit Market

Los Angeles, Jan. 9, 1918.

The blizzard has seriously interfered  
with handling of fruit and great quan-  
tities have been frozen in transit or on  
siding. The injured fruit is being dis-  
posed of as rapidly as possible and is af-  
fecting the market. Lemons have sold at  
especially distressing prices in certain in-  
stances. Weather is clearing and per-  
fectly sound fruit is yet meeting fair de-  
mand.

## Shipments

Total shipments of citrus fruits from  
California since November 1, 1917. South-  
ern California, oranges, 2250, lemons 566,  
total 2816. To same date last season, or-  
anges 2803, lemons 798, total, 3601. Cen-  
tral California, oranges 1764, lemons 76,  
total 1840. Same date last season, 3746  
oranges, lemons 117, total 3863. Northern  
California, oranges, 197; last year 838.

## AT THE AUCTIONS

New York: 6 Nav. 6 Lem. but few  
sold on account of cold. Nav. \$2.60-  
\$4.40.  
Boston: 6 cars, lower. Nav. \$1.60-  
\$5.10. Lem. \$1.70-\$4.35.  
Cleveland: 5 cars, lower. Nav. \$3.45-  
\$5.30. Lem. \$3.50-\$5.25.  
St. Louis: 1 Val. 1 Lem. Val. \$4.15,  
Lem. \$3.00-\$4.15.

January 3  
New York: 5 Nav. 1 Val. 5 Lem. Many  
lemons frozen in car. Nav. \$3.30 to  
\$4.50. Lem. \$1.65-\$3.50. But few selling  
at high figure. Val. \$3.30-\$3.80.  
Boston: No sale account blizzard.  
Philadelphia: Only 1 car sold. Lemons  
frozen in transit, selling \$1.50-\$2.80.

January 4  
Cleveland: 2 Nav. \$3.05-\$4.50. No lem-  
ons sold.  
St. Louis: 2 Val. \$3.20-\$3.95.

January 8  
New York: 2 Nav. 3 Lem. Weather  
better, market higher. Nav. \$3.85-\$5.70,  
Lem. \$2.40-\$3.85.  
Boston: 3 cars. Nav. \$2.65-\$4.20.  
Philadelphia: 1 Lem. \$3.60-\$4.45.

## ORTHODOX

"If St. James's Bible was good  
enough for St. Paul, it is good enough  
for me." This was the emphatic pro-  
test of a New England deacon against  
the reading of the Revised instead of  
the King James version.—Congrega-  
tionalist.

## HIS TRAINING

"Well, boy, what do you know? Can  
you write a business letter? Can you  
do sums?"

"Please, sir," said the applicant for  
a job, "we didn't go in very much for  
those studies at our school. But I'm  
fine on beadwork or clay modeling."—  
Louisville Courier-Journal.

## INCREASE THE YIELD

Dr. Wm. S. Myers of the Nitrate Prop-  
aganda writes as to what nitrate has  
done, in fact, he issued booklet touch-  
ing upon this question and giving re-  
ports of various experiments, especially  
as to the state experiment stations. The  
booklet may be had by writing to Dr.  
Myers, 25 Madison Ave., New York City.

MONTHLY WEATHER AND CROP REPORT

In the northern half of the state the rainfall, while deficient, has been sufficient to start a new growth of grass and to sprout wheat and barley, which is coming up to good stands. In the southern half the rainfall has been so little that pasturage is very poor, and scarcely any wheat and barley has come up, and that which has germinated has a poor color. It is getting too late to do much toward increasing the acreage of wheat in this section, although there is much land available for this crop. Should good rains occur in January the acreage in barley will be greatly increased. In many of the southern counties pasturage is extremely scarce and considerable stock have died. Hay is hard to get and besides it is very expensive. In the coast counties there have been a good many foggy mornings and the consequent dampness has been beneficial; but good soaking rains are badly needed in this section, as well as in the interior south of the delta counties.

The dry weather has interfered somewhat with the cultivating of the land for beans. Irrigated truck crops are doing well as there have been no damaging frosts. But few early potatoes have been planted as yet, and the old crop has all been dug and marketed.

Pruning and spraying have begun in many of the deciduous orchards and the weather has been favorable for this work. Citrus fruit is ripening nicely and, while the crop is light, the sizes are extra good and the gathering of oranges and lemons is progressing under favorable conditions. Olives have nearly all been picked and the losses by late frosts were small.—E. A. Beals, District Forecaster.

MARKET NOTES

Imperial reports decreased planting of cantaloupes.

Even exceptionally high prices do not prevent shipping of California butter to Eastern markets.

The East is calling for more California celery, and high prices are being received.

Mexican tomatoes in Los Angeles markets are bringing around \$2.50. Arrivals some days are as high as two cars.

Cotton is soaring higher than ever. Thirty cents is promised before many days.

Many truck farms of South Atlantic states are buried under snow. How much the damage will be will not be known until it melts away. So far as can be judged South Carolina reports cabbage not more than 45 per cent of normal, lettuce 50 per cent. Florida's last report shows cabbage 78 per cent compared with 85 month preceding; strawberries, 75; tomatoes, 65; peppers, 50. The weather has not only been cold but very dry. Louisiana: Lettuce, 77; onions, 72; cabbage, 77; strawberries, 65; turnips, 80. Onions are being transplanted. The last severe frost in Louisiana was on December 31 and was very severe. Texas: Cabbage, 50; lettuce, 40; onions, 90.

All Southern Texas was visited by severe frost December 29.

California conditions as reported by bureau of markets: Artichokes, 85; cabbage, 82; carrots, 89; cauliflower, 70; celery, 79; lettuce, 78; onions, 87; spinach, 88; strawberries, 87; tomatoes, 86.

Earliest planted cantaloupes in Imperial Valley already up.

NITRATE FOR FARMERS

David F. Houston, secretary of agriculture, today made the following statement regarding the purchase of 100,000 tons of Chilean nitrate for fertilizer use by farmers under the provision in the food control act which authorizes the president to procure nitrate of soda for this purpose and to supply it to farmers for cash at cost:

"I have been giving a great deal of thought and attention to the nitrate question. I have been in daily touch with the war industries board, which was to purchase and deliver the material at the seaboard, and also with the shipping board. Arrangements were completed several weeks ago, through the war industries board under the immediate supervision of Mr. Baruch, to purchase approximately 100,000 tons of nitrate of soda in Chile in accordance with the authorization for such purpose in the food control act. Because of disturbed condition, it has been impossible until recently definitely to secure facilities for transporting the nitrate in whole or in part. Within the last few days preparations have been completed for the delivery at the seaboard during January of 18,000 tons, and every reasonable assurance has been given that supplies, up to the 100,000 tons, for the ensuing months will be delivered. Every possible effort will be made to make certain these deliveries, but it should be understood that, on account of existing situations, circumstances over which there is no control might intervene.

"I cannot state today exactly what the price will be, but it will be approximately \$75 on board cars at the seaboard. Farmers will have to pay freight charges to their local stations, the state fertilizer tag fee, which varies in different states but will probably not average more than 25 cents a ton, and any other local charges.

"The nitrate secured under the appropriation will be sold only to farmers for their own use during the coming season, and generally not in excess of the amounts used by them heretofore. The department is now arranging machinery for the distribution of the material and will give full publicity concerning the details of the matter."

BRIGGS IS BACK

Briggs, C. A., is again on the job seeing live stock men in the north and central parts of California.

Mr. Briggs has purchased a little farm in the rich bottom lands near Sacramento. Pure bred Jerseys will be his hobby, but he will be able to talk all kinds of live stock and for the California Cultivator to breeder and farmer.

ALFALFA LAND FOR DAIRYING

Also first-class Orchard, Bean and Sugar Beet land. Twenty acres and up with easy terms of payment.

BRENTWOOD IRRIGATED FARMS, In Contra Costa Co., 63 Miles from San Francisco For Price and Descriptive Matter Address BALFOUR, GUTHRIE & CO., LAND DEPT., 350 California St., San Francisco

Know Live Stock

Characteristics of every breed—best methods of breeding, training and general care with specific directions on how to buy and sell are given in this best of all LIVE STOCK and COMPLETE STOCK DOCTOR BOOK, a 1400 page Cyclopedia of Live Stock for the Western Rancher and Stock Owner.

This is without doubt the greatest book value on the subject ever offered to readers of this paper. It is the only work of reputable competent authorship covering these important subjects, recommended for general popular use, as a safe guide for the farmer and stock owner, by educated surgeons and by the press. The author, A. H. Baker, M. D. V. S., was the founder and for 27 years Dean and Professor of Theory and Practice of Veterinary Medicine, Chicago Veterinary College.

A great book of 1400 pages. If you would know all about Horses, Cattle, Swine, Sheep, Goats, and Poultry, their anatomy, with careful and illustrated analysis of the points of Domestic Animals with all the diseases to which they are subject, with remedies for the curable diseases, send for this great book. It explains by methods of object teaching, with written instructions, how to know diseases in domestic animals, the causes, prevention and cure.

Information and instruction are given in plain simple language free from technicalities, but scientifically correct. The remedies prescribed are readily obtained and easily applied.

Over 30 color plates and 1000 object lesson engravings, including one illustrated chart for accurately telling the age of the horse from six months to twenty-nine years old.

The Book, Livestock and Complete Stock Doctor, is published in a single neatly and durably bound volume of 1400 pages 6½x9½, weight seven pounds and bound in law sheep. A new copy will be sent complete to any address in the United States upon the following terms:

One subscription to California Cultivator at \$1.00 and \$6.00 in cash.  
Two subscriptions to California Cultivator at \$1.00 each and \$5.00 in cash.  
Four subscriptions to California Cultivator at \$1.00 each and \$4.00 in cash.  
Five subscriptions to California Cultivator at \$1.00 each and \$3.00 in cash.  
Six subscriptions to California Cultivator at \$1.00 each and \$2.50 in cash.  
Twelve subscriptions to California Cultivator at \$1.00 each with no additional payment.

This is an easy manner in which to obtain this useful and valuable book. Get up a club of 12 subscriptions to California Cultivator among your neighbors or send part subscriptions and part cash as above and you will find that the book will pay for itself in satisfaction to you many times over. We will refund money on return of book in good order if the book is not as advertised.

## Everything That Counts for Your Profit and for the Future of Your Family Is Moving at Motor-Car Pace and Radius

You can't shut your eyes to that. Are you going to stick to horse-pace, one-fifth the pace of motor cars, and to horse-radius, one-fifth the radius of motor cars?

Are you content to see others seize the golden chances that are offered now and the untold chances that are coming in the next few months? Or will you join your neighbors who are moving at motor-car pace?

A little delay now may have results that all your future cannot repair.

Take this up now. Be fair to yourself, to your girls and boys, to your wife. Look into the changes of the last few months which have placed the whole question of motor-car service vs.

horse service in an entirely new light. We say—

1. Motor cars are now cheaper to use than horses for all work that a motor car can do.

2. Of all the motor cars giving maximum service the one that costs least to run and use is the Maxwell.

That ought to make you think. We don't expect you to act on it until we have proved it to you. We can prove it to you. For the sake of your own work and profits, for the sake of your girls and boys and wife, take this up now. Send us a letter today. Make your decision while these cars of greatest efficiency and economy are still procurable. We will send you the name and address of the nearest Maxwell dealer.

## Southern California Mid-Winter Poultry Show

Jean A. Koethen Strolls Through Poultry Show and Reports for Cultivator Readers as to the Entries Which Make Up One of California's Most Significant Exhibits.

**T**O SAY that this show of 1918, which has now passed into history, was the best ever staged in Los Angeles, would not mean much, for that word "best" has been overworked and misused till it has no meaning left. To say that it was altogether the most significant show in ten years and notable both for the variety of birds shown and their high quality, is still doing scant justice to the energy of the management and the enthusiasm and perseverance of Southern California breeders.

This show was significant because it was a challenge to untoward conditions. "We are not beaten and we won't be beaten" was the slogan inscribed on its banner. English fanciers the first year of the war were so panicky over the cost of feed that

Orpingtons in number, and Rocks of all colors stood third. To be exact, there were 162 Orpingtons of all colors, 154 Rhode Island Reds, and 101 Rocks, with the Barred variety ahead, but not so far ahead as it sometimes is.

Another significant feature of this show was the attention paid to utility features. The egg contest, in which eggs of various breeds, carefully selected for size and uniformity, held an important place on one of the side counters, and several breeding yards of strictly bred-to-lay birds were shown. Even the aristocratic Orpingtons, leaders in exhibition qualities, were placarded with the legend, "They lay when eggs are dear." If fine feathers have any reason for being, it is because they cover real utility qualities.

Minorcas were a smaller class than usual, and, what was rather surprising, the buffs nearly outnumbered black and white together. White-faced Black Spanish were a larger and better class than usual, as were Andalusians. Anconas were a good class, not so large as in some previous shows, but containing fine birds. Rhode Island Whites, which three or four years ago were seen for the first time, are growing in popularity but will never compete with the Reds, whose brilliant dark coloring makes Red Alley one of the most attractive features of every show.

Wyandottes are never a very large class, though why it would be hard to say. There was the usual variety of colors—White, Columbian, Buff, Partridge, and a very handsome pen of the Golden Laced variety. A particularly fine breeding yard of Golden Pencilled Hamburgs attracted no little attention, and there were a few of the Silver Pencilled. Hamburgs may well be classed among those utility breeds which for some reason or other have been compelled for so long to sit in the seats of the fancy that their utility qualities are almost forgotten. There is no handsomer fowl than the Hamburg, and no better layer.

The display of White Leghorns consisted mainly of half a dozen very handsome males, but the White Leghorn is a bird that does not need to be shown to have its qualities known. Brown Leghorns were an unusually

good class. If I am not mistaken those which were shown here last week took prizes a year or so ago at Madison Square Garden. There was a sprinkling of Cornish, Langshans, Buttercups, Speckled Sussex, and Houdans, and the best string of Pit Games ever shown in Los Angeles. Japanese Silkies, which are usually considered merely a curiosity, were out in such numbers as to suggest a suspicion that they may after all have some utility qualities, and in one corner near the door several cages of handsome pheasants attracted much notice.

Of making new breeds there seems to be no end. Two were introduced to the public at this show, a breed called the Golden Gate, which looks something like an extra sized Sicilian Buttercup, and another called the Ovo Grande, which, as its name indicates, is more remarkable for its large egg than for anything else.

When I attend the mid-winter poultry show I always make a list of the different varieties of bantams, and I never fail to find at least one new one. The list this year comprised Buff, Black and White Cochins, Golden Pencilled Hamburg, Silver Pencilled Hamburg, Indian Game, White Polish, Rose Comb Black, Red Pyle Game, Golden and Silver Duckwing Game, and Black Breasted Red Malay. Perhaps it was because I was accompanied by my 11-year-old daughter, who was attending a poultry show for the first time, that I noticed more than I had before the rare beauty of some of these little creatures. Her eyes opened wider and wider at every new proof of the fancier's skill. If there is any breed that has not been bantamized, it is because no one has yet tried.

Toulouse Geese were an unusually fine class. There were five varieties of ducks and two of Guineas, and the turkeys were magnificent. One bronze tom was said to weigh 50 pounds, and the color of the whole class (there were 20 in all) was almost perfect. Bourbon Reds were unusually strong, and there was one splendid White Holland tom. If this fine showing of turkeys indicates increased interest in their culture in our climate, which is so well suited to it, the poultry industry is to be congratulated.

Utility Contests Attract Much Attention. Slogan Inscribed: "We Are Not Beaten and Won't Be Beaten." Fancy's, Games and Bantams Not Large Exhibit but High Quality Stock.

The second floor of the Coulter Building on Broadway, in which the show was held, was given over to rabbits and pigeons. Far be it from me to attempt to give a complete list of either of these claimants to favor. Among rabbits there were Flemish, Giants, Himalayan, New Zealand, Short Hair, Long Hair, English Lop, Blue Vienna, Fur Bearing Rabbits, and dozens of cute little covies, and who knows how many more? The important thing is, that they are nearly all raised for meat, and that the rabbit is coming more and more to take the place of beef and mutton and pork.

Handsome Lookers—Handsome Doers

A prize winning White Wyandotte male and mate, owned by Arthur W. Huskins.

A few rabbit hutches and a chicken pen in every back yard will go a long way toward supplying meat for the family.

According to the papers, there were in the show 400 rabbits and 700 pigeons. Of the latter, there seemed an endless variety: birds with bills and birds with none; pouters that seemed all crop and muff; Tumblers that were all feet; Frill Frocks with ruffled plumage, and Monks and Nuns with their queer cowls and hoods; Carriers which really carry messages, and Homers that know the way home no matter where they are; Helmets and Blondinettes and Carreaux and Runts and Kings; pigeons black and white and white trimmed with black and black trimmed with white, and buff and mauve and brown and purple and fawn and all colors together. And all these, too, are good to eat, and all, as occasion requires, are going to help conserve our meat supply and defeat Kaiser Bill.

### Special Awards

The Rural World sweepstakes cup for finest display in the show was won by W. J. Stewart of Ramona Park, who entered 54 Orpingtons. The

Continued on Page 84

Winner of the Blue

First Buff Orpington hen at Los Angeles Midwinter, owned by W. J. Stewart. This is her third consecutive winning of first at this show.

shows were almost abandoned. They found afterward that that would not do, and our California fanciers, heeding the lesson, are holding on from the very beginning to all they have gained by years of work and study.

It was significant also because of the predominance in the exhibits of the dual-purpose breeds. Orpingtons have always been good show birds, but there was a time, some three or four years ago, when Orpington Alley was inconsequential beside the display of Leghorns and Anconas. "Oh, the bottom has dropped out of the Orpingtons," I heard a judge say then. If the bottom ever did drop out, hard times and high prices of meat have put it back, and in this show Orpington Alley made the short strings of Mediterraneans seem insignificant. Light Brahmas, which last year for the first time had a place worth while in the show, were an increasingly large exhibit this year, and Black Cochins were introduced for the first time to Los Angeles poultry lovers. Rhode Island Reds, which, like the Orpingtons, stand high as both meat and egg producers, came second to

## The Pistache in California

Written for California Cultivator by Claud D. Tribble

**P**ISTACIA vera is a native of Asia Minor, Palestine and Syria, therefore it would seem that the interior valleys and foothills of the San Joaquin and Sacramento, and probably the irrigable dry portions of Southern California, would furnish nearly the same conditions for growing this tree. So far as we have been informed, the pistache has only been tried under such conditions, and under any other conditions the experimenter should not go to any great expense until he is assured of success. The *P. vera* is a dry land tree and requires less irrigation than any of our orchard fruits and nuts and if planted on reasonably good soil and the very best cultivation maintained very little if any irrigation will be required.

Most of the stocks used are from semi-tropical countries. These include the *P. terebinthus*, *Atlantica*, *lenticus*, *Mexicana* and *mutica*. The *P. Chinensis* is said to withstand considerable low temperature, and its native home extends from the basin of the Yangtse River and Shangtung Peninsula to the northern districts of Peking and grows at altitudes of several thousand feet and is said to be the hardiest species of the pistache. However this stock does not grow as rapidly as the *P. vera* grafted and is not. We have buds of the *P. vera* on the *P. Chinensis* that are now four years old and three times as large as the stock, and the top is dwarfed by the slow growth of the *P. Chinensis*.

Another pistache species the *P. integerrima*, is a native of the Himalaya Mountains and grows as high as 8000 feet above sea level but this has not been tried as stock for the *P. vera* so far as we know.

### Preparation of the Seed

While we have very good success in

growing seedlings by planting in the fall directly from gathering the following method is employed by R. L. Beagles of the Chico plant introduction garden.

"Seeds containing any oil coating we put through a solution of lye, so as to cut the greasy coat on them, making the lye about one part to 50 parts of water, letting them stay in for 48 hours and then wash them thoroughly,

lay seeds on the surface, pressing them down with the palm of the hand, then cover with walnut leaves and when they start to sprout transfer to nursery row.

The roots of the young pistache tree, especially the *Atlantica*, grow in a much twisted manner straight down and without any branches, after the second year or when they are placed in orchard form they make the side roots and usually run deep into the soil. It would seem that the ground for the nursery should be good deep soil.

At two years old the trees may be

Pistache Tree at Morganhill

There are many varieties of Pistache in the Leonard Coates Nurseries. Standing by the tree is Mr. Coates, Jr.

drying and putting them in stratification. We usually stratify on the green house bench most of our pistache seed until they are ready to germinate and then planting in the nursery row. We also do considerable growing in lath houses or seed beds where we can use top sprinkling and never have much trouble if our seed are good and fresh."

Our own method is to fill shallow boxes with sand and rich soil well mixed and settle this by shaking, then

grafted or budded in the nursery row or planted in orchard form and grafted later. The regular nursery shield budding and the ordinary grafting work well on the pistache stock.

The first two or three years, if planted on very shallow soil, the pistache is subject to sour sap under unfavorable conditions, but after three years we have never lost a tree.

On fairly good soil the trees should be planted about 25x25 feet, or 75 trees per acre, and the proper time to

plant would be the same as for ordinary orchard trees, and our preference would be from February 15 to March 15.

The pistache requires good cultivation and will, under most conditions, require a small amount of irrigation. G. P. Rixford advises that the pistache should at ten years produce from 25 to 100 pounds per tree, this is of nuts in the shell, and that it takes about three pounds of nuts in the shell to make one of the shelled. From our small experience the kernels and shells weigh about the same when perfectly dry.

In growing the young pistache tree it is necessary to keep off the lower limbs to make it grow upright and the trees in orchard form may be grafted about four years from setting out. Ordinary cleft grafting done in March and April is successful as is budding done in May to September.

The *Atlantica* seed will probably be difficult to obtain as most experimenters, like ourselves, have grafted nearly all stocks to the supposed good *P. vera* varieties.

Our best commercial varieties are the Trabonella and Large Red Aleppo as given in my article in the California Cultivator of November 24. We also have another good unnamed variety. The scions came to us unnamed.

The seeds of the *P. Atlantica* are very small and a pound contains several hundred seed.

There have been seedlings of the *P. vera* sold by some of the nurseries for many years but these have not been a success as commercial nuts owing to their having white meat and the *P. vera* as a stock is too slow growing and too dwarf.

The grafts will require stakes or laths to train the limbs properly and keep from blowing out, and the tendency of the *P. vera* is to grow downward or to droop and it will require prompt attention and proper pruning to make a properly headed tree.

### RAISIN MEN RAISIN' CAIN BY NOT SIGNING CONTRACT

Association Appeals to Growers to Save the Industry

January 10, 1918.

TO EVERY MAN who believes that the Associated Raisin Company should be continued:

It is with a feeling of very great disappointment that we announce to you that our ambition to close this campaign by January 10 has not been realized. Two years ago we were able to close the campaign 20 days ahead of time. With the universal commendation of our new contract, and the great number of contracts that poured into our office the first few days, we were led to believe that it would be possible to do the same thing in this campaign, but in this conclusion we were mistaken, and what seemed to be an easy task at first now seems to be a very difficult one.

On January 1 we announced that we had 88,000 acres under contract, and today we have 97,000 acres, which means that even with the very great effort that has been put forth within the past ten days less than 1000 acres per day have been signed up. If this same progress should continue until February 1 we would be 10,000 short of the required amount.

It is impossible for us to believe that this community is going to let a few thousand acres stand between them and prosperity for six years, and this letter is to sound a note of warning, as it will be absolutely necessary to "shift gears and get into high speed" without a day's delay if victory is to be ours.

As pointed out in our letter of January 1, the work is becoming more difficult each day, as the field is more restricted and the opposing forces are becoming stronger and more active; so again we appeal to every grower who has not yet signed a contract, to do so without delay. Many people are

## Olive Trees

such as these are grown only on our foot-hill locations. ~ Note the good roots ~ for hardiness they have no equal.

We have a fine lot of Mission and Manzanillo trees, both on Picholine roots and grown from cuttings. We have had splendid success on all Olive plantings—a most important assurance to you.

Submit a list of your tree wants for special quotation. Do it right now.

We have also a complete assortment of Shipping Plums, Cherries, Prunes, Bartlett Pears, Fall Pears, Peaches, Almonds, Apricots, Walnuts, etc.

Our foot-hill grown trees are free from root diseases common to other localities. Our trees insure your future profits in fruit growing.

And remember—we will accept Liberty Bonds as full or part payment for trees. Write us today.

## JOHN DEERE TRACTOR PLOWS

**I**N the all-important work of making seed beds your tractor will furnish only power. Your plow will apply this power. The direct work of making the seed bed—the source of your profits—will depend upon the plow. You need, above everything else, the best tractor plow you can get. John Deere Tractor Plows, *for use with any standard tractor*, have a special attraction for you as you consider the importance of plow value to tractor power value.

Eighty years of the most successful experience in plow-making is behind John Deere Tractor Plows. A trademark, made famous by good implements—as an assurance of special quality—is on these plows. This means a lot to you.

### Get These Books

Write today for our free booklet describing fully both the No. 5 and No. 6 John Deere Tractor Plows. It has a message on tractor plow value that you will find profitable to you. Ask also for our big free book "Better Farm Implements and How to Use Them." Its 156 pages describe a full line of labor saving implements—tells how to adjust and operate them. It is full of practical information that will help you. Put it in your library. Use it as a reference book. It will be worth dollars to you.

To get these books, indicate the implements in which you are interested and ask for package T.P.-14.

### John Deere Bottoms Insure Superior Seed Bed Making

In a particular way, John Deere Tractor Plows offer an attraction to you because of their superior bottoms. Bottom quality, you know, makes plow quality. The distinctive bottom quality that features John Deere Tractor Plows is secured by using only highest grade materials and extreme care and skill in adapting these materials.

You will find this superior bottom quality evident in the exceptional service that John Deere Tractor Plows give—in long life, in scouring, in pulverizing the soil, in covering trash, in turning the furrow-slice with the least possible resistance and in making uniformly deep, roomy, compact seed-beds.

### Save Time, Labor and Upkeep with John Deere Tractor Plows

In addition to their direct advantages for better seed bed making, John Deere Tractor Plows co-operate fully with the tractor for rapid, fuel-saving work. You control them from the tractor seat. They require little or no watching. Their extra clearance and scouring qualities prevent clogging. Their bottoms lift high and level for turning. The location of the axles causes the bottoms to reach full depth quickly and stay in the ground. Their John Deere Quick Detachable Shares can be removed by unscrewing only one nut and can be replaced as

easily. Their perfect balance and bottom qualities make them extremely light running. They have no chains or sprockets to cause trouble in the field. Every part is as strong as the best of material and the best of workmanship can make it. John Deere Tractor Plows are used successfully with any standard tractor. If your tractor is of the large type you will want the No. 6 plow, carrying three or four bottoms. If your tractor is of the smaller type you will want the No. 5 plow, carrying two or three bottoms.

Los Angeles, Cal.

saying that they intend to sign up, but for one reason or another are delaying. This, in itself, is a great impediment to our work, as every contract signed now gives spirit and zest to the campaign.

And to every man who has signed his contract, and to every man who is interested in the welfare of this community, whether or not he owns a vineyard, we appeal. We ask you to set aside the next 20 days to the winning of this fight. Many suggestions are being made every day as to the conduct of this campaign. Some of these suggestions are good and can be carried out, but let us not lose sight of the fact—that a campaign of this kind is not a slight of hand performance and cannot be won by magic; stunts may be good, but the one thing that will bring victory is work; therefore, let every one buckle on the armor and put his shoulder to the wheel with the determination that we must go "over the top" before Feb-

ruary 1, as it will be impossible to extend the time beyond that.

Yours very truly,  
CALIFORNIA ASSOCIATED RAISIN COMPANY, Wylie M. Giffen.

### SIGN UP 100 PER CENT

Speaking of the present campaign of the Associated for signers on the new contract President Niswander of the Peach Growers said:

"I am a strong believer in the fundamentals of democracy—in the spirit of majority rule. That the majority of growers want the association ought to be sufficient reason for the minority to join, and were it not for the spirit of selfishness and greed so prevalent in the human race, you would not now be compelled to spend time and money to induce growers to sign, but they would mail their contracts to you, and the association for the future would be 100 per cent strong."

## Spraying Notes

By Geo. P. Weldon, Chief Deputy, State Commission of Horticulture

**N**OW the time is rapidly approaching when spraying for the control of such troubles as require a spring application will be necessary. Dormant spraying is by far easier and much more satisfactory for the control of scale pests, brown mite, twig borer, leaf curl, peach blight and occasionally other insect pests and fungous diseases, than any sort of treatment during the summer season.

### Lime Sulphur

This material, which may be purchased in liquid form ready for dilution with cold water, has no superior as a general purpose insecticide and fungicide. It should be applied to all deciduous trees at the strength of one gallon of lime sulphur to ten gallons of water, preferably as the buds are beginning to swell in the spring. Any time after the first of January it may be applied to advantage. No peach grower should neglect this treatment. The two pests that are nearly always present in the peach orchard are curl-leaf and twig-borer. The former is a fungous disease that curls and drops the foliage and the fruit fails to mature. It is recognized by swollen, blister-like, reddish patches on the leaves. Lime sulphur is a perfect remedy for this trouble. If the trees are thoroughly sprayed there will be practically no sign of the disease in the spring. It also aids in the control of peach blight, which, however, requires a fall treatment for complete control.

The twig borer is recognizable in the fruit as a small worm or larva, and in the tips of the twigs in the early spring, where it eats into the new growth, hollowing it out for an inch or somewhat more from the extremity. Partially grown larvae hibernate in the crotches of peach, and occasionally other stone fruit trees. Practically a hundred per cent kill is possible if spraying with lime sulphur is done carefully.

Almonds, prunes and apricots are very apt to be infested with certain scales and mites. The most common scale is the European fruit lecanium (*Lecanium corni*). This pest is known in California as the brown apricot scale. Its control will be given under oil emulsions. The brown mite may be recognized by red, glassy eggs about the crotches of infested trees. Lime sulphur, as the buds are swelling, is effective in the control of this pest. As a general clean-up spray for all deciduous trees it can be safely and usually profitably applied at the strength and time mentioned.

### Oil Emulsions

For insecticidal purposes during the dormant season the various forms of oil emulsions (distillate emulsion, crude oil emulsion, miscible oils, etc.) are valuable and in some cases preferable to lime sulphur. Their fungicidal value is slight and if fungous diseases are to be controlled the lime sulphur should always be used. In the case of the twig borer already mentioned, oil emulsions are of no value. For brown mite and scale insects they are splendid. The European fruit lecanium occurs commonly on pears, prunes and apricots. For the control of this scale there is nothing better than oil emulsions. Like the lime sulphur, they must be thoroughly applied else the cost of material and application may be largely wasted.

### Bordeaux Mixture

No better general purpose fungicide has ever been discovered than Bordeaux Mixture. For curl leaf and blight of the peach, in fact, for all fungous troubles, it is fully as effective, if not superior, to lime sulphur. It has no value, however, as an insecticide, therefore if a combined fungicide and insecticide is needed the use of Bordeaux must never be considered.

### SEED FOR FARMERS

Secretary Houston has asked for an appropriation of \$6,000,000 to enable the department to buy and sell dependable seed at cost or at as reasonable price as possible.

"The seed situation has presented, and continues to present, many difficulties. Under the provisions of the food production act, which made available \$2,500,000 for the purchase and sale of seed to farmers in restricted areas for cash at cost, it has been possible for the department to furnish some relief. Large quantities of seed of cotton, grain sorghums and corn have been purchased for the drought-stricken sections of Texas in order to assist in making available adequate supplies of seed for the next planting season. The department is taking similar action in North Dakota and Montana and has arranged to purchase considerable quantities of old corn suitable for seed for sale to farmers in Indiana where an emergency exists with reference to the supplies of viable seed corn.

"It is clear, however, that the funds now at the command of the department are wholly insufficient to enable it to meet the situation properly. If production is to be maintained or increased next year it is essential that prompt and adequate action be taken to safeguard the seed supplies of the nation. There is urgent and immediate need for at least \$6,000,000, and it is probable that an additional sum will be required in the near future."

## Pruning the Orange Tree

**I**N AN address before an improvement association in Victoria, New South Wales, A. S. MacDonald gave elementary points on the pruning of citrus trees as it should be followed in that state. Mr. MacDonald said:

"Pruning is a subject on which a great deal can be said. In giving an outline I will only say keep the tree open in the center right from the start. By a system of judicious disbudding and pinching out of unnecessary growth pruning can be almost done without for the first two or three years. After the tree has been planted and the top cut off (this cutting depends on the shape and style of the tree) only three branches should be allowed to grow. These branches should be encouraged to get out and

up by disbudding all side shoots, keeping the main one going till it is from one foot to fifteen inches long. Pinch the end off here, and allow it to fork, and then keep these two resulting branches going in the same way. By doing this you should have at the end of the season a tree with the start of six branches or main arms. These are then allowed to grow and spread, the center of the tree being kept open by disbudding. As the tree gets older this disbudding is not needed, and the small shoots which then appear are left to grow and become fruit bearing spurs or shoots. Sometimes shoots come up and grow very quickly. These are called water shoots, and should be taken out at once, as they are of no use and if left too long only rob the rest of the tree."

## Manure on Citrus Orchards

**I**T IS probable that there are seldom serious errors in applying manure to citrus orchards in California, more largely because manure is not abundant nor cheap enough to make its use injurious in any way except negatively in that too little is applied. Its place as a humus former here is usually taken by green manure crops. It is of interest, however, to know as to methods of work in the Antipodes. Therefore we present a few points on manuring as given by a grower of New South Wales.

"At planting time manure should not be used, but when the tree starts to grow in earnest different artificial manures at various seasons are very beneficial if properly applied. Farmyard manure is undoubtedly the best of all, but must be used with a lavish

hand and applied at the right time and in proper manner. Artificial manures, being concentrated, are easier to handle and give almost as good results, if applied in conjunction with green humus making vegetation and they also must be applied at the proper times. In applying farmyard manure never place it close to the stem or butt of the tree, as the manure will cause the bark of the tree to rot if left against it for a time. I have always made a point of placing manure slightly outside the circle of the root system. This encourages the roots to reach out for it and so tends to stimulate growth. Too much manuring is bad and worse than none at all, as this fosters rank growth, which, failing to ripen properly, is cut back by frosts and is likely to cause disease. It also tends to coarsen and misshape the fruit."

## Tractor Short Course

Riverside Site of Six Day School Which Will Increase Tractor Efficiency

Registrations are coming in rapidly for the Gas Tractor Short Course, to be held at Citrus Experiment Station, Riverside, February 11-16, 1918. Not only men, but women as well, are signifying their intention of availing themselves of the instruction offered. The fact that men and boys are so generally leaving the farms for direct war service had made it desirable for women to do those things in agriculture which they can do well. Women

are already past masters at automobile driving,—why should they not also drive the iron horse with its automatic lift implements?

The course begins on Monday morning, February 11 and continues throughout the week until Saturday noon. A registration fee of \$1.00, payable any time prior to entering the course, constitutes the only charge. Any one may register. Applications should be sent to Dean, Citrus Experiment Station, Riverside, California.

## Tractor School

Arizona Offers Three Weeks' Instruction in Tractor Management. Course Given at Tucson

**A**SCHOOL for tractioners will be the central feature of the farmers' short course offered by the University of Arizona from January 21 to February 16. Several makes of tractors will be available and the student will be given instruction in the selection, repair and operation of the iron horse. Other lines of instruction which may be taken at the same time will include live stock judging, care and management; gardening and orcharding; farm dairy manufacturing; control of crop pests; poultry for meat and eggs; soils and irrigation, which will include a study of gas engines, pumps, and the development of water.

The faculty of the college of agriculture have planned to make this work intensely practical and adapt it

to the immediate needs of Arizona farmers. The work will be along the lines of regular college instruction rather than institute or extension work, and well suited to young men below the draft age, or to women, on whom the duties of running the farm during the war are apt to fall, as well as to more experienced farmers.

Accommodation on the campus will be available to persons taking the full course so far as there are vacancies. It is expected that a large number of persons will avail themselves of this unusual opportunity to take a very short college course and fit themselves for greater service. The short course will follow immediately on farmers' and housekeepers' week, which ran January 14-19.

# Armstrong Nurseries

ESTABLISHED 1889  
ONTARIO, CALIFORNIA

## Dependable Trees

count for success in Orchard Growing, whether home or commercial, because—

- they bear early
- they bear big crops
- they bear large and marketable fruit
- fruit that brings top prices
- that fills the pocket book of the owner

There are many things that enter into the production of dependable trees which should have the closest consideration—because it means so much to the buyer to know that his trees are vigorous, with strong, well developed roots—that they have been grown by skilled Nurserymen—never allowed to become stunted for lack of attention—are properly dug, roots protected from wind and sun—are packed to reach the planting grounds in perfect condition—are TRUE TO NAME—are grown from selected buds—won't have to replant 25 to 50 per cent next season,—lose a year and have an uneven, unsightly orchard which frequently occurs with unreliable nursery stock.

### Mr. Armstrong Personally Guarantees

#### Armstrong Trees to be Dependable

Back of this guarantee is his worth and reputation for honest, square dealing of more than a quarter Century—

The best evidence that Armstrong Trees are developed to obtain results, and are as represented, may be secured from your Neighbor who has planted them—One pleased customer of hundreds writes—

"Trees arrived yesterday, inspected today. Inspector says they could not be any better—I am very much pleased with them." Later—"Of the large shipment of trees I received from you I only lost one tree—We all want Armstrong Trees in this neighborhood." Mr. E. Carter, Yucaipa Valley, Calif.

### Armstrong Trees are Sold Direct to the Planter

# Plant Fruit Trees this Year

1917 proved a wonderful year for the orchardist. The returns per acre for many varieties were extremely high. California stands ready to do "her bit" when it comes to fruit production. The country naturally looks to us to meet the ever increasing demand for all varieties of deciduous and citrus fruits, grapes and nuts.

Peaches and apricots took the lead this last year, and, as a consequence, trees are in strong demand.

We were fortunate in having an unusually fine stock of all the best known varieties, and are still able to supply both small and large orders.

OLD complaints are often heard because some plants have no English names, and the botanical or scientific name, which is the only real name a plant has, is too hard to pronounce. The complainants state if English names are not given the Latin names chosen should be chosen because easy for the English tongue. This would be possible, and very nice indeed, if we could arrange it so that English-speaking scientists could discover and name all the new plants. But, unfortunately for us, many plants are first found by Frenchmen, Germans, or by the user of the, to us, almost impossible Russian.

Can we not arrange it so that all new plants must wear a zinc collar around the stem with a name already written, in imperishable ink, so plain and prosy that it warps not the English tongue to speak it? Evidently we cannot conspire with Dame Nature to this end and must accept as the correct or proper botanical name the one given by the first person who publishes a correct description in a recognized scientific periodical, for that is the recognized necessary procedure. Again all other names than the botanical one are nicknames or pure slang. "Bouncing Betsy" or "Bachelor's Buttons" may sound good to us, but what would the counterpart be in Russian or Greek? We tremble to even contemplate facing the translation. Then again, those who demand most are the most inconsistent. *Lonicera*, the Latin, is easier for us than honeysuckle, the English. Yet while we refuse the former we embrace chrysanthemum, which is the Greek name of a plant and one of the longest and most difficult to pronounce. *Watsonia* is plain to us and we handle it with ease and are proud to do honor to Mr. Watson, for whom it was named. But when a very distinguished Russian named a plant *Tschichatchewia*, in honor of another distinguished Russian, we "raise a howl." In this we are not justified, though the plant comes to us carrying this name as an unmistakable handicap, and we must give it some such appropriate and beautiful name as we have in the cases of "mule-fat," "sow-thistle," "she-oak," "liver-wort," "Dutchman's breeches," "bastard money-wort," "virgin's bower," "false dragon-head," "dog's-tooth violet," "Joe-Pye weed," etc., etc. We are so consistent. And the English language is "so rich in meaning and so wonderfully expressive."

### English Names

We are under no compulsion to give plants English names, for they have botanical names when we first get them, and if these are at all easy they should be used, for the botanical name is universal, used in all countries and languages, and with scientific precision places the identity of a plant beyond all doubt. Such names as "we" give them do not, for "love-in-a-mist" is also known as "devil in a bush" and a plant may be "Bessie Red Eye" in the Middle West and "Tommy Rott" in New England. In parts of Ireland shamrock is a small-leaved variety of white clover; in other parts it is wood-sorrel, but that distributed in such large quantities in Los Angeles each year is neither, though the seeds were sent from Ireland by two seed houses as the only genuine shamrock. A fairly thorough

## Names for Plants

Written for California Cultivator by Ernest Branton

canvass of various parts of Ireland disclosed the fact that at least 20 different plants are recognized as shamrock, and indeed any three-lobed leaf will illustrate the point St. Patrick sought to make clear.

### Fuss About Gardening

From at least two or three thousand letters of inquiry received through various periodicals since I began writing for the California Cultivator 17 years ago it is evident that many newcomers are appalled at the "don't's" that are hurled at them regarding treatment of plants. They are told some plants must have this and others must have that, and still others familiar to them "back East" simply will not grow in California at all. Ignorant, would-be gardeners, and many not so ignorant, would have us believe that California gardeners are little short of magicians. To tell the truth there are a few curious facts about a few plants that it is best to know in order to avoid having to learn in the hard school of experience. But, bless you, it is easier to grow any and all sorts of plants here than it is in any other state in this glorious Union. Experience and common sense will in a year or two solve all ordinary garden problems.

### Gardening Is Not Natural

Gardening is not a natural process, for we gather together plants from many climes and conditions and seek to make all grow in one garden under one set of conditions. It is plainly evident we cannot hope to precisely imitate the natural conditions of any. And this is seldom necessary. A swamp plant from the tropics endures a great amount of water for the reason that it has to withstand a high temperature throughout the year. The same amount of water in our cooler climate would soon stagnate growth and rot the roots. Some plants naturally thrive in a soil so poor that even a small amount of animal manure affects them adversely. Others will not endure disturbance of surrounding soil; some of this class are native to California. No one ever got better results through cultivating a *Matilija*, though many are killed by such intended kindly action. As a rule bulbs do not need manure in the soil, yet one may safely use a top mulch of several inches on the same sorts.

### Garden Simplicity

Do not forget that in all garden work we should aim to assist nature, not to overcome nature, nor to work independent of nature. If we have a steep slope on which there are outcroppings of rock and a retaining wall is necessary, do not either blast out this rock or begin below and outside it to build a new one entire, but use the outcrops as part of the wall. This is assisting nature. For in a majority of cases we cannot consistently imitate nature, but in all cases we may assist. In gardening we subdue nature to our own purposes, and it is inexcusable affectation to pretend otherwise, or that we are imitating nature. On the other hand, it should not appear that we have purposely and arrogantly determined to conquer or overcome nature. We still insist you should assist, and let your assistance be as little in evidence as is possible; simplicity to be ever in the worker's mind.

### Hedges and Enclosures

The writer is very fond of informal

When writing advertisers, mention The Cultivator.

hedges or border plantations of varying widths, with points, recesses, groupings, etc. Yet if a formal hedge is necessary or best, do not hesitate to clip it into formal design. We must recognize its use, which is to enclose, and it is just as proper to use living vegetation as it is dead vegetation in the shape of posts and pickets, or lattice, or even metal or mineral, as wire or stone. Its pur-

### The Biggest Crop

**W**E produced last year the largest potato crop America has known, 442,536,000 bushels, according to the latest figures of the bureau of crop estimates of the United States department of agriculture. The 1916 crop was only 286,953,000 bushels, while the average production from 1911 to 1915 was, in round numbers, 363,000,000 bushels. Thus, we have on hand this winter 155,583,000 bushels more than in 1916 and 79,536,000 bushels more than the average for the preceding years since 1910. We can't well send this potato surplus to Europe, but by eating it at home we can send other forms of food to the front. It should be remembered in that connection that America's consumption of potatoes has been below the average per capita consumption of other nations. It has been estimated by some authorities that we could very readily double our potato diet and be within the bounds of a healthful and desirable ration adjustment.

We should profit by the experience of the winter of 1914-1915, which affords the nearest parallel to the present potato situation. Much of the 1914 crop was held in storage that winter. It moved into consumption slowly, and the result was that in the spring 1915, as the new crop began to come in, the holders rushed to the

market, glutted it, hammered down prices, and potatoes sold for 25 or 30 cents per barrel to starch factories. We must guard against a repetition of that experience next spring, and the only certain insurance against it is to cease hoarding potatoes, to market the present supply gradually through the winter, and to increase our potato consumption. Because of car shortage and transportation limitations each section should market as near to the point of production as possible.

The food administration has no power to fix potato prices, but it has and will exercise, if necessary, power to prevent unreasonable profits. It is now working upon a plan to expedite "acceptances" of potatoes and other perishable food products and to eliminate losses and delays caused by unjustified rejections by consignees. The department of agriculture and the food administration urge those who are holding potatoes to market them gradually and steadily, so as to sell out before the new crop comes in, and they urge everyone to eat more potatoes—and less bread.

If it is in order for the Cultivator to suggest "why not have dehydrating plants, starch factories and other institutions for working up the excess and waste. In California with hay almost as much per pound as potatoes the stock feed proposition is worth considering.

### Dehydrated Products

**C**ALIFORNIA is now growing thousands of tons of turnips, which are contracted to the Canadian government. They are dehydrated, packed into small bulk and sent to the trenches. Europe has for years been dehydrating or drying potatoes and other bulky products. As a result railways have been burdened with thousands of tons less of water and a product which is nutritious and practical as well as tasty has been supplied.

Experimenters have been working on the problem in America for years, but for some reason our large way of making haste and of doing things has prevented its use. Times are changing, and the demand is here for conserving. Dr. Hazeldine of Los Angeles has plans for constructing a dehydrator, for a nominal cost, which uses the sun's heat during the day and is fitted for artificial heat at night.

Even some of the bulkier products have their moisture extracted within 24 hours and are ready for market. At first it does not appear that oranges would make an attractive "dried fruit, but as they come from this process they are most tasty, make a neat appearing product, and, from samples seen, we take it, offer a large opening for the disposal of low-grade fruits. Of course, orange wastes are already handled in the form of marmalades, dried peel, bottled juice, reduced pulp, where the entire orange is reduced for use of confectioners,

bakers, etc., and in many other ways, but there are still thousands of tons going to waste, and dehydrated oranges have an attractive appearance as processed by Dr. Hazeldine.

Every kind of vegetable may be handled by the process and, as noted, at a nominal investment. A small plant can be constructed, we understand, for around \$2,500, and we see no reason why small cooperative associations, having at times more supplies than needed, may not well unite in constructing a dehydrating plant which will prove profitable. In fact, we recently saw bottled and greatly condensed lemon and orange juice. These are reduced in bulk at very low temperatures by the vacuum pan process, and the reduction has been accomplished with all of the original fresh fruit flavor retained.

We must conserve more of our waste products.

At a recent meeting of the British Cotton Growing Association the matter of inability to ship cotton as desired was discussed, and it was determined that no relief was in sight until new bottoms are constructed.

A new fiber for sack or bag making has been developed from the banana. Machinery has been taken to Honolulu with the idea of making from Hawaiian banana plants sufficient bags for the use of local sugar mills.

The tractor is having a great demand in Argentina. Agriculture is extending rapidly, so much so that draft animals are not able to keep up with the demand.

## Farm for Profit

### and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

### MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

## Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Grafting Pecans and Walnuts

Have seedling pecans of no particular value. Can I graft them to walnuts?—Subscriber, Los Altos.

Walnuts cannot be successfully grafted on pecans. They are of different species, and while the walnut scions will sometimes start in the pecan stocks they soon die.—J. B. N.

### Winter Irrigation of Walnuts

It is six weeks since my walnut trees were irrigated. I grew potatoes between them, and ground has been in fair condition. Fear it is now getting dry, but if I should irrigate heavily with present warm weather is there danger of starting growth which may possibly be caught by a later frost?

On the other hand, if no irrigation is given, is it probable that small rootlets may be killed and trees be injured in the spring? How shall I treat my trees?—Subscriber, Los Angeles.

No harm will come from irrigating a walnut orchard at this time, but if the ground contains some moisture there is nothing to be gained if sufficient rains come later, and irrigation water can be obtained if rains do not come. The ground should be wet to a depth of five feet at the time the trees begin to grow, which is about March 10. If the rains hold off until February it would be well to begin to fill the ground with irrigation water and then keep the water in the ground by deep and frequent cultivation. However we may have an abundance of rain, since in 1884, the year of our heaviest rainfall, there was very little rain until January 26.—J. B. N.

## Sugar Beet Situation

Once Settled, Then Unsettled, Now Finally Arranged It Is Hoped. Wires Kept Hot to Washington.

IT WAS prematurely announced nearly two weeks ago that the sugar beet situation had cleared. Attorney Bishop of the Growers' Association gave out to the growers that District Attorney Woolwine of Los Angeles County, R. E. Whitley and himself had secured assurance from Washington that the food commission would take a hand and see that a just price be secured. On arrival home Mr. Woolwine received word from Washington that the arrangement made was not acceptable to the manufacturers and that the matter would be referred to the federal trade commission. This was a bombshell. Woolwine wired:

Hiram W. Johnson, United States Senator, Washington, D. C.—While in Washington Hoover gave unqualified assurance and promise that he would immediately appoint commission to take testimony and fix price of sugar beets in Southern California and like commission in other beet growing sections. Nothing done to date. Received telegram signed "Food Administration" "suggesting that promised commission be not appointed but matter be taken before federal trade commission." Beet growers disappointed and dissatisfied. Fear any hearing before trade commission would result in great delay and insist that Hoover carry out his promise and appoint commission. All questions as to the legal authority of such commission fully discussed with food administration. Hoover determined to appoint commission in spite of any legal weakness as Hoover considered findings would have sufficient moral effect to force reasonable price for beets as in successful fixing of price of milk in many northern states by same procedure. Hoover further promised to immediately appoint commission whether refiners agreed thereto or

not. Telegrams and correspondence in matter on file with food administration will further inform you as to present status. Will you please do everything in your power to induce food administration to carry out promised plan at once as any delay will prove disastrous to beet sugar production?—Thomas Lee Woolwine, District Attorney.

This wire brought a change again, and Mr. Whitley received a wire Tuesday that a special committee would be appointed by the commission which should take the matter up with manufacturers and growers:

Whitley wired: Hon. Herbert Hoover, United States Food Administrator, Washington, D. C.—The growers feel revised commission plan suggested in telegram from Judge Lamb January 14 would be a step in right direction, and urge all haste possible in appointing same. Situation is fast growing critical, as growers are buying seed in many instances to plant other crops. Many of them, however, are willing and anxious to cooperate with United States Food Administration in helping to solve sugar shortage problem. If the committee could be immediately appointed the growers are ready to submit data and a fair price for beets could be recommended very quickly if no time was lost or no unnecessary delay permitted to put off this important matter. Thorough canvass of the situation shows it is impossible to bring growers to plant until a fair price for sugar beets has been negotiated between growers and factories, and the growers will do all in their power to further these negotiations. A few days' delay will be disastrous in many sections at this stage of the work, so that any extra effort you can put on rounding this into shape quickly will be a great benefit to beet sugar industry throughout the United States. — San Fernando Valley Beet Growers. (Signed) R. E. Whitley.

## Dyspepsia

I have a horse that has acquired the habit of eating wood. He will eat the corral fence, a post, the manger or anything that he can get to that is wood. He is fed alfalfa hay and corn three times a day. I put a muzzle on him so he could not get to the wood but then he puts his nose to the ground and eats dry manure that he can get through the muzzle. I am compelled to keep him tied up in the barn with the muzzle on all the time only when he eats his feed. Can you tell me what causes this condition and what will stop him of the habit?—Subscriber, Elsinore.

This condition is not common, but a horse or cow that has been fed one kind of feed for some time may get a form of indigestion that causes the stomach to crave something all the time. The rosin in pine wood seems to satisfy this craving and give temporary relief but it is not lasting. You must change the feed and give something to change the action of the stomach. Get half an ounce of aloin, four ounces of turpentine and two quarts of raw linseed oil. Shake them together in a large bottle until they are thoroughly mixed and give half a pint of this as a drench once a day while it lasts. Also mix one pound of good fresh wood ashes with three pounds of common salt and give a large tablespoon of this once a day in the feed.

Another important thing to do is to feed the horse properly. In the morning give two pounds of hay and two pounds of grain; at noon the same, or twice as much if the horse is working. At night give him ten pounds of hay and four or six pounds of grain according to the amount of work he is doing. Never water the horse at feeding time. Give all the water he wants half an hour or longer before feeding and not again for an hour or longer after feeding. Tie him with a strap to each side of the stall so he can not reach anything while not eating. In a week he will probably be free from the desire and habit of eating the wood. In the future avoid overfeeding. Most horses are fed twice what they need to keep them in good condition and it brings on all kinds of ailments.

## CALIFORNIA BOAR SHIPPED EAST

A. J. Lovejoy & Son of Roscoe, Illinois, came to California and selected a Pacific Coast bred Berkshire boar to head their great herd in the East. The Lovejoy herd of Berkshires, established in 1876, is one of the oldest and best known herds in America, their stock having gone to nearly all states in the Union besides many of the South American countries. A. J. Lovejoy, senior member of the firm, is known as a famous breeder of Berkshires and a splendid judge of other breeds as well, having judged the Duroc-Jerseys at the Iowa state fair four years in succession. Wyman Lovejoy, now active manager of the herd, is also well known as a Berkshire judge, having awarded the honors at both the National Swine Show at Omaha and at the Eastern Berkshire Congress.

The boar selected by them to head their great herd is Violet's Champion, sired by the well known Laurel's Champion, he by Ames Rival's Best, the famous boar owned by Dean C. F. Curtis of Ames, Iowa. Violet's Champion is one of these big type, extremely smooth fellows with perfect Berkshire type throughout and was instantly recognized by Mr. Lovejoy as of champion calibre, when shown to him at the Fontana Ranch by R. K. Walker.

After taking his measurements and a careful study of his pedigree and record as a sire Mr. Lovejoy spent some time communicating with his son in Illinois with the result that the purchase was made, and the boar is now in his new home at Roscoe, Illinois. In this herd he will be mated with some of the greatest sows in America and will probably be seen at some of the more important hog shows in 1918.

The following telegram is a copy of the one sent from Mr. Lovejoy, Jr. to his father on receipt of the boar: "Violet's Champion arrived last evening. You have done a good winter's work in buying this boar for us, such strength of back, extreme length and size, heavy bone and ideal head and ear recall Masterpiece and Lord Premier's Rival. I predict that he will leave the same impress for breed advancement as did those two boars. If there are many such boars on the Coast, East or Middle West better get busy and buy them."

## FEED HOGS WHEY—NOT

Farm Adviser Baade is giving warning to members of the Napa County farm bureau to use care in the feeding of whey, and unless care is used, not to feed. He makes no reference to buttermilk, but we believe it would be entirely safe to extend a similar warning to buttermilk feeders. Carelessness at either creamery or cheese factory in using old contaminated containers passes on poisons, or at least injures livestock, and in the case of Napa County has resulted, at least so it is thought, in the death of valuable animals. Adviser Baade says:

"To date the damage runs into hundreds of dollars. We are not positive that it is the whey, yet all evidence points that way. A sample of whey has been sent to the University of California for analysis. When this is heard from we will be able to speak more positively. Dr. Dederick, the county livestock inspector, is of the opinion that when sour whey is transported in old rusty tin cans there may be a chemical action forming poisonous compounds. We would, therefore, suggest that parties who have found whey good for hog feed, transport same from the cheese factories to their ranch in wooden containers and that they do not store it in metal receptacles."

## SALE OF SHORTHORNS

At its meeting on Friday last the California Shorthorn Breeders' Association decided definitely to hold its sale at the beginning of April. Upwards of 75 head of cattle are available for entry in the sale, which will be held in San Francisco. Committees were appointed to undertake the work of preparation for the sale, and these committees have already commenced work.

The growing popularity of the Shorthorn breed is making its effect felt quite markedly, and, as a result, the purchase of yearling bulls is becoming more and more the vogue. By anticipating his requirements and purchasing a year in advance the thoughtful cattleman is assured of having bulls on hand when needed, besides having had a year in which to accustom them to the conditions which they will encounter.

Announcement will be made through the press concerning the Shorthorn Sale, while catalogues will be ready about the end of February. Interested parties can communicate with the association at its office, 320 Sharon Building, San Francisco.

California's live stock commission and the California Cattlemen's Association are doing all in their power to bring feed to the live stock, or secure proper disposal of live stock which is caught by the drouth without feed. Anyone wishing help along these lines should write to Secretary David J. Stollery, 329 Sharon Building, San Francisco.

## SILOS AND SILAGE CROPS

"Silos and Silage Crops for Arizona" is the title of Circular 17 issued by the University of Arizona. There are illustrations of concrete silos, of corn fields and 16 pages of silo information. They state that the feeding value of silage compared with other succulents is: One ton of corn silage is equal to 1.5 tons of sugar beets; 1.8 tons of rutabagas; 1.8 tons of carrots; 2.2 tons of turnips; 2.4 tons of mangels; 1.4 tons of parsnips.

## Level Railroad Crossings Will Save Lives

**B**AD railway crossings cause many serious and fatal accidents. Constructing the road with a decided rise or fall just at the track contributes largely to the danger for automobiles at such crossings; but this construction is common where the railroad is above the normal level of the highway. To eliminate all grade crossings is out of the question; therefore, efforts to decrease loss of life must be directed largely toward making necessary grade crossings reasonably safe.

The level stretch should begin at least 30 feet in front of the first rail. Since a railroad right-of-way is usually 100 feet wide, the improvement might well extend for this distance. Where the railroad fill is high enough to hide machines approaching from the opposite side, it is imperative that conditions be improved, for here there is the additional danger of two automobiles colliding. Road engineers are recommending a minimum sight distance of 300 feet at every point along the road. Especially is this desirable

A level stretch of road at each side of the track is necessary for safety.

Attempts are often made to get over bad crossings on "high." The steep ascent, combined with the necessity of slow speed over the rails to avoid jolting, may cause the driver to "kill" his engine, just as he reaches the rails. With the rear wheels perhaps still on the grade, there is no chance for momentum to carry the car over. A fast train bears down upon it—the crash is inevitable. Another accident is added to the long list.

The remedy is simple. A level stretch of road provided on each side of the track and an unobstructed view will result in saving many lives. In stead of the crest at the track, there must be substituted a level section, even though steeper approaches are necessary. In most instances a satisfactory profile can be obtained at a moderate cost.

at a grade crossing, and a level section here will aid in fulfilling this requirement.

Sufficient width should be provided for two automobiles to pass without slowing down for that purpose—20 feet at least. Then if the crossing itself is made as even as possible there will be no congestion at this most dangerous place.

The increased safety from such improvements is more than worth the cost, even though considerable. Crossings must be such that if an automobile is to stall, it shall be somewhere other than in front of a train. Cooperation between county or township authorities and the railroads, working under the state railroad commissions, where they exist, will do much to make for safety. Continued neglect means more accidents.—G. S. Eaton, in Concrete Highway Magazine.

## Does the Tractor Pay on the Average Farm?

It Depends Largely Upon the Farmer

**A** WRITER in "The Farm Tractor" says "it does, but 'Study your own farm conditions and choose a tractor accordingly.'" "Everybody has heard over and over again the last few months of how much depends upon the farmer in winning the war. The world supply of food is very far below the actual necessities of America and her Allies. There must be greatly increased production as well as wise conservation.

"How can this increased production be accomplished when the man power of the world is already so greatly diminished, and the diminishing process goes increasingly on to fill the demands of armies and navies and war munitions factories of the nations at war?

"All are agreed that one of the most, if not the most, important factors in the solution of this most serious problem of the war is power machinery on the farm. And by power machinery is meant primarily the farm tractor. But can the farm tractor in its present state of development be made a paying investment for the average farmer who has and cultivates, or tries to cultivate, a farm of from 100 acres to 300 acres?

"A farmer of this class who has tried it out is better qualified to answer this question than anybody else.

Others may have fine theories and be well versed in the technique of the tractor machine, and, in fact, may know all about the tractor and how to run it; but this farmer knows from experience just what the tractor will do.

"With this very thought in mind, we sought out the owner and manager of a farm of about 260 acres, and asked him to tell from his own experience some things he has learned about tractor farming, and whether, in his opinion, it will pay the farmer. He has an 8-16 tractor which he drives part of the time and part of the time his regular farm hand drives. He cultivates corn, wheat, oats and grass. He has made himself thoroughly acquainted with his tractor and knows how to handle it and to utilize every service it is capable of rendering, just as he knows how to use horses and other farm implements. This is the key to the successful and profitable use of the tractor by any farmer; and just as in anything else on the farm, as well as in any line of business, added to knowledge of the thing in hand, must be good judgment and common sense.

"Probably the greatest drawback to the common and universal use of the tractor on the farm at the present time is its likelihood to give the average farmer, untrained in mechanical

# SPRAY

## Does Orchard Care Pay?

The returns per acre of 40 corn-belt orchards for the last three years are as follows:

Properly pruned and sprayed areas, total received, \$176.00 per acre, net profit \$143.00 per acre. Untreated areas, total received \$18.00 per acre, net profit nothing. There is only one answer to that question:

Ask About The FIELD-OSPRAYMO LINE which includes a Sprayer for Every Need.

The Ospraymo Policy is to give big values for moderate prices. The Ospraymo Catalog goes into details and gives the information you most want.

Show rooms at 164 Los Angeles St., Los Angeles.

skill, what is called "troubles" in operation. So we asked:

"Do you have troubles with your tractor?"

"In the first place I have an ordinary, practical knowledge of how to run my tractor, and every time before starting to use it I try to find out and know just what shape it is in. If it is not in good shape, I put it in proper condition before starting it to work. Just as if I took a horse out of his stall and harnessed him to a wagon or plow and found he was sick or lame, I'd unhitch him and call in the veterinary doctor, or doctor him up myself, till I got him in proper condition, before I put him to work. Just as in everything else, and probably more so than in most other things, you've got to use your head in using a tractor. With fair knowledge of your machine, ordinary care and good judgment, there is no necessity for more "troubles" with a tractor than with horses and other farm machinery. It depends a great deal on the man behind the engine."

"How much per acre does it cost you to plow with a tractor?"

"Well, that depends largely on conditions, just as it does with horses. If the soil is in good condition I can break an acre with two gallons of coal

oil and a pint of cylinder oil. Of course, there must be added to this the wear and tear of the machine and the cost of the operator. But allowing three plows to your tractor, which is a load for four horses in ground in prime condition, and for at least six in ground in bad condition, I should say it costs me very much less than with horses. But this is not the best of it. You see there is a great scarcity of farm labor right now, and especially what might be called skilled farm labor. This better class of labor is the most profitable in the handling of horse power plows and other farm machinery. The tractor has the advantage of doing the same work on the farm, and even more, with less help; so, therefore, it is really a greater advantage to the farmer, under the present conditions especially, in its saving and conserving labor, than in its actual saving in cost per acre of operation. The tractor can be advantageously used in the preparation of the soil for the seeding of any ordinary crop, especially the cereal crops, but the cost per acre for this preparation depends entirely upon what kind of preparation you make. It does not cost half as much to seed with a tractor as in any other way I ever tried."

### Short Course in Care and Use of Gas Tractors

How to use gas tractors with the greatest efficiency, and how to lengthen their lives and increase their usefulness by keeping them in perfect repair—such is the subject of the "Short Course" to be given by the University of California at the Citrus Experiment Station at Riverside from February 11 to 16. The university points out that with the present limited supply of labor it is the patriotic duty of every tractor owner to see that his tractor does as much work and as good work as possible, and proper training for the operator and proper care of the machine are of the first importance.

This tractor course will be similar to one recently held at the University Farm at Davis at which 184 people learned how to operate and repair tractors. There will be lectures, illustrated with charts and models, on gas engine principles, fuel, carburetors, magnetos, timing, adjustments, etc., and instruction by experts from various factories as to the construction, repair, and operation of the eight or more makes of tractors to be used. There will be field demonstrations on how to operate tractor machinery and make tests as to horse power. Each student will have opportunity for actual practical work in soldering, pipe fitting, carburetor adjustment, bearing adjustment, ignition timing, belt lacing, and the like. The

course is open only to those who can show that they will be able to make definite use of the knowledge gained. The only expense will be a registration fee of one dollar. The tentative program is as follows:

Monday, February 11, 8 a. m. to 12 m., registration; 1 p. m., opening address by Director H. J. Webber of the citrus experiment station, followed by a lecture on engine principles; 2:45 to 5 p. m. practice work.

Tuesday, February 12, lectures at 8 a. m. and at 1 p. m. on fuels and carburetion, each followed by three hours of practice work.

Wednesday, February 13, lectures at 8 a. m. on ignition and at 1 p. m. on magnetos, each followed by three hours of practice work.

Thursday, February 14, lectures at 8 a. m. on lubrication and at 1 p. m. on timing and adjustment, each followed by tractor practice.

Friday, February 15, lectures at 8 a. m. on repairing tractors and at 1 p. m. on testing and horse power rating, each followed by tractor practice.

Saturday practice from 9 a. m. to 12 m.

The staff of instructors will include J. B. Davidson, professor of agricultural engineering; R. S. Vaile, assistant professor of orchard management; L. J. Fletcher, instructor in agricultural engineering; A. B. Lundy, and several service men from various tractor factories.

### Ditch Making---A Mile a Month by One Man

Written for California Cultivator By Fred Haxton.

IN Clallam Bay in Washington a farmer recently completed a big ditch job on which he did all the work with his own hands. Today there are 3300 feet of channel open an average of two feet, ten inches deep and three and a half feet wide at the top, and he finished the job in exactly 17 days from the time the first dirt was moved.

This is at the rate of 200 feet a day, or more than a mile a month. The ditch was made entirely by blasting, without a shovel being used in the finishing, and the use of explosives was the only thing that made the making of the ditch possible because of the low cost, speed and ease. Laborers are scarce on the Pacific coast, just as they are in Kansas and Pennsylvania and Massachusetts. Labor

also is high in price. It seems on all well regulated farms, the time flies so that there isn't time to dig a ditch by usual methods between the date when the fall crops are in and the plowing must be done.

To make this ditch half stick charges of a high percentage powder were used in holes about 16 inches deep. At some points where the ground was not very wet they were placed deeper, but in most of the length of the ditch this depth was right for the effect desired, on account of the nature and condition of the ground—clay loam very full of water. The distance between the charges varied from 16 to 26 inches, depending on the character of the soil at each spot, which was watched carefully by the blaster.

# CASE

Famous  
the  
World  
Over

## Never Before Have Silo Fillers Been Built the Case Way

In sturdiness and construction, in ability to do good fast work, Case Silo Fillers cannot be equaled.

All are built to withstand the severe strain put to a machine of this kind. Case Silo Fillers all have large throat capacities.

A simple gear-shift permits cutting four different lengths. The boilerplate knife-wheel prevents dangerous breakage.

Case Silo Fillers are made in three sizes—the 12-inch, with a capacity of 8 to 12 tons per hour; the 16-inch, with a capacity of 15 to 20 tons per hour, and the 20-inch, with a capacity of 20 to 30 tons per hour. This affords a size for any silo.

A complete description of Case Silo Fillers, with pictures, will be sent free upon request. Don't buy any Silo Filler until you have investigated the Case.

days from date of the transaction, and  
the subscribers must have mentioned the  
Cultivator when writing the advertiser.**THIS WEEK'S COVER**

The poultry industry is surely  
laboring under difficulties these days  
of high prices of feeds. Poultry pro-  
ducts, of course, bring high prices  
also, but these are not as high in pro-  
portion as are the prices of feeds, and  
with the extremely narrow margin,  
the careless feeder has been pinched  
out, or is being pinched out. Where  
the poultry man has sufficient capital  
to secure proper equipment and to buy  
feed in quantity he may still weather  
the storm until the kaiser is beaten  
and normal conditions return.

Comfortable houses with possibility  
of economical work are shown in the  
illustration on the cover. Such ar-  
rangement is one long step toward  
success in the poultry business.

**PORKLESS DAYS**

We still can't eat pork on Tues-  
days, but because of feed conditions  
on this Coast the taboo has been tak-  
en from beef, and it is possible to eat  
the fat and juicy porterhouse on  
Tuesdays "for them as has the  
price."

California live stock men have been  
appealing for some relief from the  
situation, and permission to sell beef  
for which there is no feed. Feed con-  
ditions are getting no better fast; the  
promised rains did not come.

**HATCH EARLY**

The poultry people who are  
finding profit from the winter layers—  
and there are plenty of winter layers  
for carloads of California eggs are go-  
ing forward to the blizzard afflicted  
East—are already planning a hatch-  
ing campaign to begin soon. Late  
hatched chicks are tardy in coming  
to producing age, and California is re-  
ceiving large returns because of last

year's early hatching. We believe our  
poultry people are materially advanc-  
ing the welfare of the state by their  
plans for early work.

**GROW YOUR FUEL**

Federal Fuel Administrator  
Schwabacher of California has ap-  
pealed for conservation of our avail-  
able supply of coal. We hope most  
Cultivator readers grow their own  
fuel. It is easily done in California,  
and we believe with profit, even on  
our higher priced lands. As a war  
measure, plant a tree. Two tons of  
seasoned wood is worth one ton of  
coal. A cord will run close to two  
tons.

**DRAFT THE BREAD LINE**

The Country Gentleman has  
suggested that there be conservation  
of the men forming a long bread line,

Let us never forget that the cultivation of the earth is the most  
important labor of man. Unstable is the future of a country which has  
lost its taste for agriculture. If there is one lesson of history that is un-  
mistakable, it is that national strength lies near the soil.

—Daniel Webster.

a photograph of which, taken at mid-  
night by flashlight, is shown. It  
thinks that with farmers appealing  
for laborers this line of able bodied  
men should be conserved and placed  
on the farms.

Perhaps it would lessen the length  
of the bread line in the cities if this  
were done, but we feel that the plac-  
ing of such a class of men on the  
farms would not in any way increase  
the production of those farms. Such  
men would be as helpless as children  
and merely call for greater expense on  
the part of the farmer.

Industries in which a gang of men  
can be placed under the supervision  
of a boss may handle that type of la-  
bor, but farming calls for different  
conditions.

**AN IMPORTANT INDUSTRY**

But a few years ago California  
was importing hundreds of cars of  
eggs and poultry products. True, we  
sent enough fruits to more than jus-  
tify this extravagance, but long be-  
fore the war began to convince us of  
the necessity for conservation we be-  
gan to discover how some of the  
wealth of the state might be held  
here by producing more of our staple  
foods. The poultry men were in line  
in this investigation and this effort,  
and instead of receiving 200 or 300  
cars of products we have changed the  
balance until today we are exporting,  
or sending to Eastern markets, 1200 to  
1300 cars of eggs. We are as yet send-  
ing but few cars of broilers or other  
poultry products. The broiler indus-  
try of California has not proved as at-  
tractive as straight egg production.

Among the strongest factors in the  
encouragement of the industry have  
been the Southern California Poultry  
Producers' Association and the Cen-  
tral California Poultry Producers' As-  
sociation. These associations are  
both organized under the general di-  
rection of our state market director  
and have proven satisfactory to the  
majority of the members. There are,  
as is always the case with cooperative  
public spirited effort, those who would  
take advantage of the stabilizing of  
prices effected by such organizations  
and yet be free from supporting them.  
People of this type are now endeavor-  
ing to destroy the associations' effi-  
ciency by selling outside the associa-  
tion with which they have contracted  
to market their product.

**DOWN THE TAXES**

Californians seem to be the  
most cheerful givers of taxes of any  
people in the United States. Our per  
capita state tax cost is \$11.14. New  
Yorkers get off easier with \$8.11  
apiece; Massachusetts, still better,  
with \$7.00; little old New Jersey  
comes in with \$6.40; Wisconsin and  
Iowa are paying at the rate of \$5.95  
and \$4.60; while Pennsylvania, with  
8,000,000 people to care for, does it  
for the tidy sum of \$4.30, or nearly  
one-third of the per capita tax of Cal-  
ifornia.

At one time the voters of this state  
started in to lessen the influence of  
selfish interests in politics and state  
management. This succeeded most  
admirably. It appeals to us that the  
present moment would be a very neat  
time to Hooverize on our taxes or at  
least to begin to plan for a set of men  
to vote for whose aim shall be pri-

marily to lower the expenses of  
state government.

Lest we may be considered knock-  
ers, we believe we are entirely just-  
ified in saying that California's state  
government can show many admir-  
able points. We have much to which  
we can point with gratification and  
say to our Eastern friends that while  
we are paying large taxes we are get-  
ting much in return, but have we not  
reached a point which calls for a lit-  
tle more careful study of the situa-  
tion?

The tax situation is not created by  
the state government alone, but near-  
ly every county and municipality in  
the state has been throwing it in the  
high for the past few years.

**PREVENT FIRE LOSS**

In spite of the campaign for  
fire prevention the average mortal  
says: "This does not concern me.  
Let the other fellow profit by it." But  
note the following from a letter from  
the forest service:

"More than 1500 fires occurred in  
the national forests in California dur-  
ing the season of 1917. Although most  
of these fires were small and insignifi-  
cant, at least 150 were severe, and  
more than \$100,000 was spent by the  
forest service in suppressing them.  
No complete figures are available of  
the amount of damage done, but be-  
tween 15,000 and 18,000 acres of tim-  
berland were burned over. In addi-  
tion to this a large amount of private  
property was consumed. Twelve peo-  
ple at least were reported by the press  
to have lost their lives in forest and  
brush fires the past summer in Cal-  
ifornia."

To be sure the last season was un-  
usually long and unusually dry.  
There were drying winds; there was  
never such traffic in the mountains;  
there was never such shortage of la-  
bor for fighting fires. Then there  
were other aggravating factors. But  
it is none too soon to look to the next  
dry season and find wherein we may  
lessen the loss and the direct suffer-  
ing which comes from these fires and,  
still more, the indirect loss which  
comes from the destruction of our  
watersheds, which it may take years  
to fully appreciate.

**This Week's War News**

The Italians are still victorious.

Great Britain is to recruit half a  
million young men.American troops in France are fill-  
ing the trenches more and more every  
day.Yarmouth, on the eastern coast of  
England, is bombarded and three  
killed.Italian vessels make dash into har-  
bor of Trieste and sink Austrian  
cruiser.Ex-Premier Caillaux of France is un-  
der arrest, charged with giving com-  
fort to Germany.Fierce artillery duels are about the  
only activities along the front in Bel-  
gium and France.Germans refuse to recognize dele-  
gates from the Ukrainians in the  
peace conference.A quartermaster warehouse in  
Washington arsenal is burned with  
large supply of munitions.English aeroplanes made successful  
attacks on railway workshops and  
munition factories at Karlsruhe.The coal shortage has caused many  
vessels to be held in New York and  
other harbors several days over sail-  
ing time.Congressman Gardner of Massachu-  
setts, first to resign from congress and  
enter the army, died from pneumonia  
in Camp Wheeler.Sporman, a spy, has been arrested  
at Norfolk, Virginia. Appeal was made  
from all parts of the country that he  
face the firing squad.Blizzards and the coldest weather of  
the season have prevented the trans-  
portation of coal, and much shipping  
has been delayed because of non-de-  
livery.An army captain by the name of  
Whisler robbed the army bank at  
Camp Funston, Kansas, killing four  
attendants and seriously wounding  
Paymaster Wornall.Mutiny at Sebastopol early this  
week caused, it is thought, by the  
break in peace negotiations at Brest-  
Litovsk, resulted in the death of four  
admirals and of other officers.Ambassadors of the Allies and neu-  
trals in Petrograd are demanding im-  
mediate release of the Rumanian min-  
ister who was imprisoned. The Bol-  
sheviki decline to explain why he was  
arrested.Prussian junkers are now asserting  
they will fight until absolute victory,  
and conditions with the mass of the  
people are more unsettled than at any  
time since the war began. Reports are  
that the famine in Berlin is severe.The nationalization of the railways  
has presented a perplexing situation  
to California financiers because of the  
fact that the revenues of the state have  
largely been derived from railways  
and other corporations. The state ad-  
ministration is endeavoring to protect  
California's interests.

In an address to the Russian people  
in Petrograd, David R. Francis, Amer-  
ican ambassador to Russia, said: "The  
Russian people cannot be too often re-  
minded or too deeply impressed by the  
fact that their hard-earned freedom is  
jeopardized by negotiations for a sep-  
arate peace, nor that if Germany dom-  
inates Russia, their highly-prized lib-  
erty and fruits of the revolution will  
be sacrificed."

# Agricultural News Notes of the Pacific Coast

## Northern California

Yolo County is advertising "first poppies of the season."

Rice growers of Glenn County organized at Willows last Saturday.

Seventy-five new factories were located in San Francisco during 1917.

The Dodge Rice Company at Chico, is planning to plant 1000 acres to cotton.

Prof. E. C. Voorhies of the University of California is in training at Camp Kearny.

Dairymen are finding it necessary to get more returns for their product or cease to buy feed.

The state water commission has granted many applications for water filings on streams of the Sierra Nevada.

In the closing of an estate in Yolo County the court ordered sale of 1107 sheep, which brought return of \$14,424.15.

From the port of San Francisco there were exported to Japan in 1915 goods to the value of \$13,667,486; in 1916, \$33,678,876.

The California Ripe Olive Company at Oroville, Butte County, is planning to extend its operations to include the canning of spinach.

It is estimated that the acreage planted to beans in Sutter County last year will be doubled this year, meaning an acreage of 80,000.

A public meeting to consider the next county fair was held in Ferndale, Humboldt County, last evening. Effort will be made to bring off a big fair.

San Francisco will appoint delegates to the fifth national foreign trade convention, who will endeavor to call attention to California's possibilities.

The Placer County farm bureau has this week made an auto tour of various counties of the Sacramento Valley to observe cultural methods of other farmers.

The Sacramento Valley Sugar Company has leased hundreds of acres in Butte County. Practically 6000 acres of beets will be grown tributary to this plant.

Prof. Woll of the animal husbandry department of the state university is attending a convention of the American Society of Animal Production at Ames, Iowa.

Yolo farmers are divided on the Chinese labor question, many maintaining that we must first correct our home situation by drafting labor not now availed of.

Farm bureau meetings in Glenn County will be held at Elk Creek, January 21, 22; Plaza, 24, 25; monthly meeting of directors at Willows, 10:00 a. m. January 26.

A deputy of the collector of internal revenue will be in Anderson, Shasta County, from January 31 till February 5 to advise with all who will pay the income tax as to making out their reports.

The Vacaville fruit growers' association reports the past as its most prosperous season. It sold 70 cars of deciduous fruits for a gross of over \$1600 per car. Officers elected for the next year are: President, C. J. Uhl; vice president, George Alger; secretary, W. H. Buckingham; treasurer, George Samuels.

## Central California

Kern County has a shortage of potato seed.

Mt. View, Stanislaus County, farm center meets January 26.

Kings County Bee Keepers' Association met at Hanford and reorganized.

San Joaquin Valley will grow considerable cotton during the next season.

Stanislaus County squirrel drive is to take place the first week in February.

Porterville has made big shipments of magnesite, the total reaching 1970 cars.

At an auction sale of a grade dairy herd at Modesto, an average of \$135 per head was made.

Alfalfa is being trucked to the hills to feed starving range cattle. It is bringing \$25 in the stack.

An auction sale of purebred live stock was one feature of the farm bureau meeting in Hanford.

The Valley Growers' Association has fixed upon \$2.75 per ten hour day as compensation for pruners.

Income tax officials are visiting various counties of the valley and giving advice as to making returns.

Tulare creameries have issued cream checks during the last 12 months aggregating \$1,617,000.

A meeting of live stock men was recently held at Modesto, at which the new branding laws were explained.

Lindsay's output of oranges for the season totalled 804 cars. Its crop of olives is about 25 per cent of normal.

Kern County's farm adviser is giving practical advice and assistance where needed in the building of silos.

A vine pruning demonstration by Professor Flossfeder has been conducted at various centers near Modesto.

Dr. A. J. Payne, who has succeeded Dr. Cady in hog cholera work, has been holding demonstrations in Tulare County.

The Kern County farm bureau has distributed \$1100 worth of squirrel poison and contemplates the buying of a full car of Kilmol or bisulphide.

The Central California Bean Growers' Association has been formed, and it is estimated that 75 per cent of the acreage will affiliate with the association.

A mass meeting held at Selma, Fresno County, to discuss the Pine Flat irrigation project brought such small attendance that no definite action was taken.

The Bee Keepers' Association of Tulare County, at its meeting in Tulare elected C. W. Tompkins, president, and R. B. Steeves, Orosi, secretary. A marketing organization was formed.

The growth of the poultry industry of Tulare County has been phenomenal. The Cooperative Association shipped during last year eggs to the value of \$74,000 and poultry to the value of nearly \$25,000. It is thought the industry of the county netted \$500,000.

Turlock, Stanislaus County, has a district which shows a total of farm products amounting to \$7,310,000. It is estimated the increase over the preceding year was approximately 40 per cent. The crops were staples, \$2,000,000 being for corn and beans and \$1,500,000 for cantaloupes.

## Southern California

E. O. Essig is appointed farm adviser of Ventura County.

Hemp is said to net about \$60 per acre in Imperial County.

Southern California poultrymen are holding a great show in Los Angeles this week.

Imperial Valley wants a vigilance committee to deal with the cattle rustlers question.

Orange County bean growers have been filling war department orders, having shipped ten cars.

Extended improvements and additions are being made to the Pomona Valley Canning plant at Pomona.

Registrations are already coming in for the Tractor Short Course to be held in Riverside, February 11-16.

Representatives of Collector Carter are giving information as to the income tax in various southern counties.

Arlington poultrymen have reelected J. M. Davison, Riverside County's member of the Poultry Producers' board.

Because of the profitability of cotton and other crops and dairying the Imperial Valley may possibly plant less of melon acreage the coming season.

Imperial Valley will have an output this year of about 35 carloads of grapefruit. The Southern Pacific buys Imperial Valley fruit for its diners.

Redlands orange growers announce they will do but little shipping until February. It is feared the district will not ship more than 250 cars of Navels.

It is estimated that the total output of English walnuts from Southern California will be about 11,000 tons. This is the largest output ever, and the price the highest.

The slump in prices of ostrich feathers has lessened demand so that ostrich farms are now on the bargain counter. A bird that a few years ago could have commanded \$300 is today going at \$10.

Alfalfa growers of the state are invited to meet in Riverside, Saturday of this week to form a state association. This along the same lines as the Southern California Association which has been so successful.

One of the two original Navel orange trees at Riverside is reported as dying and experts are endeavoring to save it. The state now receives in excess of \$50,000,000 annually from the orchards which have come from this tree and its mate.

Lima bean growers are still maintaining the \$12.12 price. How much the war department will award is still problematical, but the double sacking and extra care demanded by the department increases the cost about 50 cents per hundred pounds.

Last month was Southern California's warmest December in 27 years. On New Year's day three persons were overcome with the heat at the Pasadena Tournament of Roses, and women attending the great football game were attired in filmy summer gowns.

A bill is soon to be introduced into the senate by Senator Johnson of California covering the Colorado River Project. One measure of the bill provides for immediate appropriation of \$2,000,000 to meet the cost of connecting the Imperial irrigation system with the Laguna dam.

## The Coast and General

California's mines gave an output of \$41,457,000 last year.

Oregon is shipping large numbers of sheep to Ontario, Canada.

Haiti has forbidden exports of food to enemies of the United States.

Albany, Oregon, recently shipped one car of beans valued at \$6000.

The Colorado River is now discharging about 7,000 cubic feet per second.

England has 600,000 less hogs than a year ago and over a million less sheep.

A concrete elevator of 100,000 bushels capacity is being built at Athena, Oregon.

The number of sheep in the British Isles has declined slightly more than 1,000,000 head in 1917.

Utah appeals, not for a "beanless day," but for a bean day in which everybody shall eat beans.

Oregon University is certifying to the quality of seed potatoes which are known to reach the provided standard.

Clallam County, Washington, reports more extensive clearing of stumpage lands than any preceding year.

California is not a great silver producing state, but in 1917 she produced over 2,000,000 ounces valued at \$1,745,375.

Twenty-first annual convention of the American National Livestock Association is to be held at Salt Lake City, January 14-15.

Growers of Sudan in Oregon have found indifferent success from last year's planting, but are planning for a more general trial of it next year.

The Utah-Idaho Sugar Company handled last season 65,000 tons sugar beets. This was practically the first crop grown in the Yakima Valley.

Arizona has appointed E. H. Thomas as assistant state leader of county agents. His headquarters will be at the agricultural extension office, Tucson.

The first sugar of the season is now rolling in to Eastern cities from Cuba, and the famine is broken. The prices have been cut one cent per pound.

The war department states that, contrary to the usual belief, physical examination shows that country boys are not physically the superior of their city cousins.

The Commercial Club of Salem, Oregon, is planning for a factory for the weaving of a fiber from flax grown in that section, the fiber to be used in airplane construction.

The Rogue River Berkshire Breeding Association, Oregon, has been formed. It is purely cooperative and aims to unite the breeders in securing the very best blood of the Berkshire breed.

By-products factories in North Yakima, Kennewick and Selah Counties, Washington, paid farmers for waste products over \$300,000 and manufactured them into products which commanded close to \$1,000,000.

Over ten percent of all working people of America are out of a job, some due to sickness, others to seasonal conditions. The average loss to workers in this country on account of sickness is nine days every year. This loss aggregates over \$700,000,000.

# Stock Owners— Here's Your Answer

## What is Pratts Animal Regulator?

Not a food. A general conditioner and tonic for horses, cattle, sheep and swine of all ages. A health builder and preserver.

## What does it contain?

Medicinal herbs, roots, etc. Natural tonics, appetizers, digestives, blood-purifiers, worm-expellers. A scientific, perfectly-balanced combination needed by working, producing and growing animals.

## What does it do?

Pratts Animal Regulator improves and preserves health and, in a natural way, increases strength, growth and production. Prevents most diseases. Saves feed by aiding digestion. Makes rich, red blood and improves circulation. Regulates the bowels. Expels irritating worms. Makes livestock more profitable.

## Does it give satisfaction?

Satisfaction guaranteed or money refunded. The user to be the judge. America's original stock tonic and conditioner, widely used for nearly fifty years.

## How is it used?

Daily, in small quantities, mixed with the feed. Full directions with each package.

## What does it cost?

The price is low—large packages most economical. Pratts Animal Regulator actually costs nothing, since increased production returns the investment with big profits.

## Where can I get it?

From 60,000 Pratt dealers. There is one near you. Direct from manufacturers, prepaid, if your dealer can't supply you.

## Can I learn more about it?

Yes! Write the Pratt Food Co., Philadelphia, for valuable FREE BOOK on profitable management of live stock. Mail your request today.

PRATT FOOD COMPANY  
Philadelphia Chicago Toronto

**pratts.**

## As Others See Us

THE following letter appeared in a recent issue of "Black and White Record," written by A. A. Hartshorn, one of the foremost Holstein breeders of the country and formerly president of the Holstein-Friesian Association of America. Mr. Hartshorn was in California late in October of last year, at which time he attended the October sale at Sacramento.

After visiting the orange and olive groves of Butte County and her rice fields, Mr. Hartshorn attended at Sacramento "a sale of Holstein cattle and there met many of the California breeders. There was a lively interest manifest and the cattle sold for good prices."

In describing his visit to the 11,000 acre Kiesel Ranch near Sacramento, he says: "Here we saw a fine herd of Holsteins and a ranch that not only produced the alfalfa and corn for those 200 animals but grew \$110,000 worth of beans the past season. Most of the country we passed through going out to the ranch was devoted to the raising of beans. The bean crop of the Sacramento Valley, the past season brought about fifteen million dollars.

"Our next stop was with A. W. Morris & Sons, not only California's greatest Holstein breeders but one of the greatest firms breeding Holstein cattle in America. In fact, I never saw a herd numbering 400 animals,

that equalled the Morris herd, either in production or individuality. It will pay a lover of good Holstein cattle to go a long way to see such a herd. Although this firm has not been breeding Holsteins as long as some of us, yet when we see the thought and energy that Mr. Morris and his four sons put into the business, it is no wonder that great success marks their efforts.

"In Modesto, we visited several choice herds, one of which was owned by Miss Holdridge, two of whose cows had just completed records, one of 33.91 pounds of butter in seven days, and the other 34.21 pounds, and she fed and milked them herself. Both of the cows had given over 100 pounds milk in a day, and one of them was at that time exceeding that mark. Miss Holdridge had several daughters and a son of these cows and they were a very promising family of cows. In fact, her herd of nearly 100 animals was one of rare excellence.

"We next went to Kerman, where we visited our friend D. C. Stanyon, who is beginning the breeding of Holsteins and has the foundation of a good herd.

"We were taken out by Mr. McAlister & Son, to their great ranch and inspected a remarkably fine herd of Holstein cattle.

"Space fails me to tell of the great animals in this herd but it was certainly a great treat to see such a collection of fine animals."

## The House of Holstein

By F. H. Stevens

NOTE—This article is reproduced from the December 15, 1917, issue of "Holstein-Friesian World," Syracuse, New York, and coming as it does from the pen of F. H. Stevens, a member of the firm of Henry Stevens & Sons, who since 1876 have been acknowledged one of the foremost Holstein breeding establishments in America, the article carries more than usual weight.

WE READ in St. Matthew, chapter seven, twenty-fourth to twenty-eighth verse, as follows:

Therefore whosoever heareth these sayings of mine, and doeth them, I will liken him unto a wise man, which built his house upon the rock:

And the rain descended, and the floods came, and the winds blew, and beat upon that house; and it fell not: for it was founded upon a rock:

And every one that heareth these sayings of mine, and doeth them not, shall be likened unto a foolish man, which built his house upon the sand:

And the rains descended, and the floods came, and the winds blew, and beat upon that house; and it fell: and great was the fall of it.

Is our short-time official record a foundation of sand?

The growth of the Holstein-Friesian cow in popularity has for the past 25 years made history unprecedented by any race of domestic animals. This popularity has had as its foundation the seven-day test, and in view of the past achievements it might at first thought seem unwise to consider moving our Holstein structure from this foundation.

For more than a decade, each year has seen added to the membership of the Holstein-Friesian fraternity dozens of wealthy men who have been successful in other enterprises and who have taken up the breeding of Holstein cattle as a fad, as an accessory to a country place, or from the sporting spirit which causes other men to take up the breeding and developing of the race horse. Doubtless in nearly every case the matter of

financial gain is also considered, and also in nearly every instance these ventures have been a success from a financial point of view. These breeders always have the worthy ambition to become leaders in their new field as they nearly always were in their business, and, believing the old adage that like begets like, they are willing to pay the ever increasing price for the descendants of the largest record animals.

This demand for the extreme seven day records has naturally made its own supply. We have learned if a cow isn't required to do too much throughout the year, she will at freshening time take from her stored-up fat and energy and make phenomenal records for a short period of time. Expert handling and feeding have been involved and 30, 40 or even 50 pounds per week records have followed each other so rapidly as to leave the mass of Holstein-Friesian breeders in amaze. Seeing the financial success attending the remarkable achievements of the few, the breeders have, generally speaking, fallen in line, with more or less successful endeavors to keep in the race until I fear the real dairyman, whose business is to make milk continuously at a profit, has been lost sight of.

How long will such methods endure? Already we are hearing our great seven day records talked of disparagingly. There is no question among intelligent men that the accuracy of these records is not safeguarded in every conceivable way, and with possible rare exceptions they are correct, but even so their real value from an economic point of view is questionable. Aren't we building our Hol-

## ABORTION IN CATTLE

PREVENTED AND CURED PERMANENTLY  
YOUR COWS MADE PROMPT. REGULAR BREEDERS BY  
**STERILOID**

### STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and

have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

**GUARANTEE:** We will refund money in every case when STERILOID FAILS to make good. Price \$1.00. Mail postpaid. In plain wrapper. Dept. L 598-408 Columbus Ave., New York City. Reference, Colonial Bank.

stein-Friesian house upon the sand? Will there not come a time when the buying public will demand more than a seven day record and when our present basis of value will be swept away and must be replaced by long time production?

Almost any breeder now is ready to admit that the long time production is the real measure of the dairy cow's value, but as long as the buying public is willing to pay the money for the short time tests and not seemingly willing to let long time records enter seriously into their calculations, just so long will most breeders work for the immediate dollar rather than for the future welfare of the breed.

I believe the officers of our association should make great the incentive for long time tests, and the greatest and most far reaching incentive would be to evolve some system whereby the cost of making these tests would be greatly reduced. It would seem that this work could be supervised, after the present method of the cow testing association, and somewhat reduce the cost of inspectors. It might be advisable to offer money prizes for yearly herd records in which every milking member of the herd would take a part and would in that way get a year's record.

What would doubtless arouse even more interest would be a futurity, for sires, classified as to ages, two year olds, three year olds and so on. It might be well to make these futurities not only for the individual animal, but for groups of five, ten or perhaps even more daughters of the same sire in the same divisions.

I can conceive of no greater honor

## Butter and Cheese Scoring Contest

H. S. Baird of the Dairy Industry Division of the University of California Wants New Suggestions- Last Contest of 1917. Lots of Pep in Preparations for 1918 Contests.

**T**HE sixth scoring of the 1917 Educational Butter and Cheese Scoring Contest was held at San Francisco, December 27, 1917. Seventeen cubes of butter and 16 cheese were entered.

N. Nyborg of the Modesto Creamery, Modesto, received highest score on butter with 93½. High scores on cheese were as follows: Cheddar, H. C. Watson, Bieber, tied with I. J. Bennett, University Farm Creamery, with 92; California (Granular), Chas. Basclarini, Dixon Cheese Factory, Dixon, 93½; Jack, Rufus Steele, Swanton, 93.

The scoring was done by T. J. Harris, official inspector of the San Francisco Wholesale Dairy Exchange, S. L. Benning and H. S. Baird of the Dairy Industry Division, University Farm, Davis.

The following are scores of entrants whose names are published:

A. G. Ericson, Gold Medal Creamery, Stockton, 92½.

Ed Hooper, Spreckles Market Creamery, San Francisco, 92½.

C. A. Johnson, Bodega Cooperative Creamery, Bodega, 92½.

G. G. Plunkett, Exeter Creamery Association, Exeter, 92½.

H. Dons, University Farm Creamery, Davis, 92.

J. T. Hague, McCloud Dairy, McCloud, 91½.

### Good Workmanship on Butter

Mr. Denning, who was one of the judges, makes the following comment on the butter.

"The average score of the entries in this scoring was 92.24. Although this average is not as high as that of

for any sire than to have ten of his daughters make more milk and butter in a given year than the ten daughters of any other sire. Perhaps there are other inducements more practical than these that would tend to the more general adoption of the long time tests.

The problem of the dairyman is becoming each day harder to solve. His produce goes largely to a class of people who must depend on it as a cheap food, and no matter what the cost of production may be there is a limit to what he can sell it for. His labor is continually advancing in cost as are also the feeds for his cattle. Through federal enactment the byproducts of the distillery are unavailable and the proposed enactment of the coming legislature will also very likely remove from the market brewers' dried grains and malt sprouts so that a half of our former tonnage of high protein byproducts will no longer be available. This, of course, will tend to greatly increase the price of those remaining. We as Holstein-Friesian breeders should be prepared to supply the dairyman with the cattle of proved ability in long time production for he must have animals of this class in order to survive.

I am not sure but it would be the part of wisdom with the future of our breed in view to entirely abandon the seven day test. Very likely this would react to our immediate disadvantage. "A moving house is not a comfortable habitation."

But the long time production is the rock upon which the foundation for the permanent success of any breed of dairy cattle must be built.

some of the former scorings it is a very creditable showing. There was no score below 90, while 76 per cent of the entries scored 92 or above. The most defects in flavor were those caused by old or unclean cream. During the cooler months and periods of light production it is often the case that the creamery, as well as the patron, becomes a little neglectful in the proper delivery of the cream to the creamery which results in the bitter, stale or unclean flavors in the resulting butter. Cream that is kept at a low temperature for several days may have a low acidity, being practically sweet but containing a bitter, unclean flavor which will produce a butter of inferior quality. The acid test by itself cannot be depended upon at this time of the year as a satisfactory basis for grading.

The workmanship of the butter, as a whole, was very good. Most of the cubes had a very close, firm body and were free from grit and mottles.

The body was criticised mostly for being leaky. Several of the samples were very open and contained a great deal of loose brine. This defect is probably due to the fact that the recent rains have started the pasture to some extent and the cows are now getting a small amount of green feed. This together with the effect of the number of fresh cows in certain localities might give a softer fat than the buttermakers have had in the past few months and he has not yet adjusted his methods to meet conditions. Several of the entries were extremely light in color and were criticised for this defect."

### Cheese Shows Winter Characteristics

There was a larger number of

A PRIZE WINNING CREAM SEPARATOR

## THE DE LAVAL CREAM SEPARATOR

### Is a Winner!

Why don't you let it win for you?

At the great national and international expositions, the juries have invariably acknowledged the superiority of the De Laval. They awarded the Grand Prize, the highest possible award, to the De Laval at the Panama-Pacific Exposition at San Francisco in 1915, as also at Buffalo, Chicago, St. Louis, Paris, Brussels, and all the great world expositions for more than 35 years.

What the world's greatest dairy experts, the men who operate the creameries and the big milk plants and dairies, think of the De Laval is best evidenced by the fact that 98% of the cream separators in use in such plants the world over are of De Laval make.

### De Laval Produced Cream Makes the Best Butter

Since 1892 the National Buttermakers' Association has held butter-scoring contests each year in connection with its Annual Convention, and at every such Convention butter made from cream separated by a De Laval Separator has scored highest. This is a 100% record for the De Laval. No room for chance there. Only unusual merit made such a record possible.

Proof of the superiority of De Laval Separators and of De Laval produced cream has been piled up and multiplied so many times that it is no longer questioned. It is an accepted fact.

If you are without a cream separator, or in need of a better one, let the De Laval start winning a bigger cream profit for you NOW.

## Elliott-Brant Rancho Guernseys Are Persistent Producers

The results of our first two years of official testing show our herd to average 10,172.28 Pounds of Milk and 507.97 Pounds of Fat. One half of these cows were heifers with first calf who averaged 8,670.24 Pounds of Milk and 436.01 Pounds of Fat (only seven pounds under the average of all A. R. records). Our mature cows averaged 12,710.5 Pounds of Milk and 621.52 Pounds of Fat (120 pounds over the average of the mature cows of the breed).

A bull from these cows will increase the production of almost any herd.

## THE GREAT PROVEN SIRE King Mead of Riverside

Stands out among the leaders of the Holstein breed as a sire of large yearly record daughters. He is the sire of AAGGIE ACME OF RIVERSIDE 2D, the only cow in the world that has produced over 2425 pounds butter in two years and 1331 pounds in one year, strictly official test. He has another daughter, Aralia De Kol Mead, that is soon to finish around 1150 pounds, strictly official.

Sons of this great sire almost ready for service now available at dairymen's prices. Some are more than half brothers to these two great cows. Among the lot are two seven-eighths brothers to Aralia De Kol Mead. Their dams have records above 800 pounds butter.

Would it not be good business to breed some of this blood into your herd? It is the real solution of the high production cost problem.

Their pedigrees and prices on request.

W. F. Young, P.D.F., 244 Temple St., Springfield, Mass.

cheese entered in this scoring than in the fifth. The quality was a slight improvement over the last scoring also. The average score of all cheese entered was 91.38. The averages of the different classes were as follows: Cheddar, 91.3; California (Granular), 91.25; Jack, 91.8.

The flavor of the Cheddar cheese was fair but generally speaking, was too mild. These cheese seemed to show a lack of acid development in both flavor and body. Some flavors were very mild, similar to the California (granular) and the bodies on these cheese were rubbery, and did not "break down." Five of the seven cheese in the Cheddar class were criticised for being too "open."

The principal criticisms on the flavor of the California (granular) and

Jack was "bitterness." The workmanship on these classes of cheese, generally speaking, was better than that of the Cheddar. The most common defect in the body was "too soft" due to too much moisture. The finish on several of the cheese was cut on account of their untidy appearance. Some of the cheese had bad "follower rims." This can be avoided, largely by turning the cheese in the hoops the first thing in the morning and placing them back in the press for a few hours.

This completes the scorings for the 1917 contest. Some changes will be made in the contest to be held in 1918. We will appreciate suggestions from any interested parties relative to the improvement of the coming contest.—H. S. Baird, University Farm, Davis, California.

## California Sheep and Wool Growers Meet

Discuss Marketing and Other Business Measures

ON JANUARY 3, 4 and 5, the California Sheep and Wool Growers' Association held their tenth annual meeting at the University Farm at Davis. About 50 sheepmen from all parts of the state attended the meeting, taking part in the varied discussions vital to their interests.

"Better Methods of Marketing Wool" was discussed by Market Director Weinstock. The advantages of collective marketing were clearly pointed out and a strong discussion followed. It was the consensus of opinion that the growers were not realizing the full value for their wool and a promotion committee of ten was appointed to thoroughly investigate the advisability of establishing a central warehouse whereby it would be possible to sell large lots and thereby interest Eastern buyers.

F. W. Washburn, manager of the Western Meat Company, delivered a short address on "The Sheep Market," referring to the present extreme high price of mutton causing a decided curtailment in the fresh mutton trade.

President Nares addressed the meeting on the "Importance of Cooperation and Organization," emphasizing conditions. Professor True outlined the work undertaken by the livestock commission of California recently appointed by the Food Director R. P. Merritt. W. H. Heileman delivered an address "Sheep on the Farm," outlining the project of placing a flock of sheep on the average farm and the work being undertaken by the extension division of the University of California through the farm advisers and in cooperation with the animal husbandry division. Mr. Heileman encouraged the establishing of farm flocks, telling of the success of such flocks in his county.

F. A. Ellenwood called attention to the curtailment of lamb consumption by Food Dictator Hoover, requesting that no lamb or veal be served on dining cars, restaurants and hotels.

While the food administration has realized its mistake and assured the sheepmen the matter would be adjusted, the cards "No Lamb Served" may still be found on dining cars and in restaurants. Mr. Ellenwood contended that the most economical method of producing mutton is in form of a five or six months lamb which would dress 36 pounds. If the sheepman was compelled to keep this lamb until a year old, the carcass would probably then weigh 46 pounds, or an additional ten pounds. On the

other hand, by selling the lamb at five months of age, the sheepman can keep a breeding ewe in place of this lamb, which would produce another lamb which would dress 36 pounds or a total of 72 pounds against 46 pounds, resulting in a gain of 26 pounds of dressed mutton by selling lambs at five to six months.

Professor R. F. Miller explained that the use of lambing sheds was generally considered practical where bedding and hay can be provided. Losses of lambs are materially reduced. A circular has been prepared on lambing sheds, giving various types of shelter and discussing the use of same, which may be had by applying to Division of Animal Husbandry, University Farm, Davis. Professor Miller also discussed advisability of establishing an advanced registry for fine wool sheep. Since the wool clip admits of concrete measurement it is possible to determine the yearly performance of rams and ewes similar to dairy cow production. This would not only result in increasing the annual wool clip of stud rams by better feeding and breeding, but would assure the man buying rams of the performance of their sires or dams. Figures were presented giving the results of a number of fleeces which had been tested for weight, shrinkage, length, etc., factors to be considered in qualifying for the advanced registry. Considerable discussion followed and an Advanced Registry Board was later appointed.

A special feature of the meeting was a ram show held at the judging pavilion, where different breeds and types of rams were on exhibition. Also a demonstration in machine and hand shearing was held and the Rambouillet stud ram owned by the University Farm was sheared after the sheepmen estimated the weight of the fleece on the sheep's back, it being exactly 12 months growth. The ram sheared 30 pounds.

An illustrated lecture on "Sheep and the National Forest" was delivered by C. A. Rachford, assistant district forester of the United States forest service.

The following committees were appointed: Legislative; Ernest A. Gammon, Thomas Gianella, Willard Clark, C. A. Kimble, D. I. Waltz. Advanced Registry Board; E. A. Bullard, Prof. R. F. Miller, C. A. Kimble, Mrs. F. A. Meacham. Marketing Committee; F. A. Ellenwood, Grant Wilcox, Peter Moi, D. J. Murphy, Thomas Gianella, F. L. Washburn, C. A. Kim-

## Hampshires and Duroc-Jerseys Prize Winners

## High Protein Tankage for Hogs

Manufactured by

1000 Lyon St., Los Angeles  
Riverside Santa Barbara  
San Diego

Nutritious Animal Foods must contain large percentage of either carbohydrates or proteins or both. Organic food contains both but in widely varying proportions. Carbohydrates give strength and animal heat. Proteins replace wasted tissues and promote growth. A "Balanced Ration" is a feed so proportioned as to contain these substances in proper relative quantities for the requirements of the animals to be fed. As feed for hogs all grains are deficient in growth producing proteins. One pound of WILSON'S HIGH PROTEIN TANKAGE to ten pounds of grain gives a well balanced ration, makes rapid and solid growth, and when feeding to sows makes heavier, stronger pigs. Feed separate or mixed, wet or dry.

Feeding Booklet sent on request.

## CATTLEMEN!

Your cattle brand must be registered with the Cattle Protection Board before February 20, 1918.

Applications received after that date will be given only secondary consideration.

Persons using unrecorded irons will be liable to arrest.

## DUROC JERSEYS

Sows, gilts and a few boars of the best breeding FOR SALE

H. P. Slocum & Son R 1 Willows, Cal.

ble, Louis Olcees, P. R. Peterson, H. A. Jastro.

Officers Elected

Officers elected for ensuing year: F. A. Ellenwood, president; C. A. Kimble, vice president; Prof. R. F. Miller, secretary; F. N. Bullard, treasurer.

It was decided to hold the next annual meeting again at the University Farm at Davis.

We have from Secretary Miller the resolutions from which we quote:

The Resolutions

The resolutions called attention to a present shortage of mutton and wool and appealed to the sheep breeders for greater production and also made appeal to the department of the interior for aid in the present food shortage. "We earnestly request the Honorable Franklin K. Lane, secretary of the interior, to cooperate with us by granting, with such restrictions as he may see fit, to open federal lands within California to the grazing of sheep."

Another resolution called for organization of an agency for the marketing of wool and to the end that such an organization might be perfected, a marketing committee of ten was appointed.

Regarding the effort of Ralph P. Merritt, food director of California, to improve marketing conditions of livestock and live stock production, a resolution fully endorsing all efforts of the food director and live stock commission was passed, and "this association stands prepared to lend assistance and cooperation in every way possible."

As to labor: "The owners of sheep in this state are desirous of lending all assistance within their power to bring the war to a speedy and victorious conclusion, but are unable to render the maximum amount of assistance in the production of feed and clothing for ourselves and Allies unless the labor necessary to the proper handling of stock is secured;" . . . "this association respectfully requests that those governmental departments, who are in close touch with all phases of the labor situation, give this matter serious consideration, and assist in providing the wool growers with an efficient labor supply."

"The California Wool Growers' Association will pay a reward of \$100 for information leading to the arrest and conviction of any party stealing sheep from any member of this association, and the secretary should prepare a record of the marks and brands of sheep of the members of this association."

As to forest burning and the securing of better sheep feeding by it, it was unanimously resolved that the rule of the forest reserve that this practice shall be absolutely under its control is right and has the fullest support of this association.

The association wants a larger bounty than at present and urges that congress enact a law granting bounty on all predatory animals, that the legislature protect the sheep from dogs; that the proper authorities be asked to fix a rate for the shipment of feeder or stock sheep from valley points to mountain ranges and return.

## Sensational Holstein at National Dairy Show

Early Dawn Peep 2d

Early Dawn Deep 2d, a purebred Holstein cow, afforded one of the sensations at the National Dairy Show at Columbus, Ohio, by making a typical Holstein record of 33.52 pounds of butter in a week. While that is a good record, it is not an exceptional one for a Holstein cow. It is unusual, however, in view of the conditions under which it was made. The strain of traveling to the show, the strange barn, the crowds of the curious and

the excitement incident to the show were all serious obstacles to the making of a record. It is a wonderful record in view of these trying conditions. Her record for seven days at the show was 634 pounds of milk of 4.22 per cent fat, yielding 33.52 pounds of butter.

Early Dawn Peep 2d last year made the semi-official record of 1,287.72 pounds of butter in a year. She is owned by Peter A. Small of Chesterland, Ohio.

## Range Cattle Conference at Tucson

A complete summary of the range feed and stock conditions of Arizona, based on a recent January survey made by the agricultural extension service, will be reported by G. W. Barnes, livestock specialist, this afternoon, Saturday, January 19, at the range conference held at Tucson, Arizona.

Hon. Dwight B. Heard, chairman state council of defense, will on the same morning give a report on "Special War Problems of Beef Production," bringing important messages from national livestock shows and conventions at Chicago and Salt Lake City, from which he has just returned.

PURE BRED

REGIST'D HOLSTEINS

# King of the Black and Whites 83354

## The Greatest Producing Sire in California

Now has 30 A. R. O. daughters, a greater number than any other sire in California, and more coming right along.

He was the first bull in the world whose seven nearest dams averaged over 30 pounds butter in seven days, and this is only one instance of the remarkable uniformity of the great production records in his pedigree both for milk and butter.

He is transmitting his wonderful inheritance of large milk and butter production because there are no weak spots in his breeding for generations back, no throwing back to a low producing ancestor, and by every law of animal breeding his daughters, as they are already proving, will be uniformly great producers and his sons will hand down his good quality to their offspring.

## King of the Black and Whites

is being given a full opportunity in our herd where he is being mated with a large number of high record cows and highly bred heifers. We have none of his offspring to offer at present, but if you want to keep your herd in line with the march of production records it will interest you to visit our herd and get acquainted with these matings.

We have a limited number of grandsons of King of the Black and Whites and King of the Pontiacs for sale at moderate prices and terms.

## HENDERSON COMPANY

Sacramento Bank Bldg.

Sacramento, Cal.

In placing FINDERNE Soldene Valdessa at the head of our herd of carefully selected registered Holstein breeding females we believe we have secured a very desirable combination of individuality and production.

**HIS SIRE** is King Valdessa, who is by a son of the highest record daughter of the mighty King of the Pontiacs, and is out of Valdessa Scott 2nd, 41.88 pounds butter in seven days, 164.29 pounds butter in 30 days, both world's records when made, and her wonderful transmitting power is shown by her five A. R. O. daughters with records up to over 38 pounds butter in seven days.

**HIS DAM** is the world's record heifer FINDERNE Soldene Hengerveld, 35.34 pounds butter in seven days, 136.82 pounds butter in 30 days at first calving as a three year old, and she is a daughter of the wonderful sire King Hengerveld Aaggie Payne who has three junior three year old daughters with records from 31.94 to 37.33 pounds butter in seven days, and four senior three year old daughters with records from 35.33 to 37.13 pounds butter in seven days. One of his daughters holds the world's record in the junior two year old class for yearly production with a record of 1200.64 pounds butter, another holds the world's record in the junior three year old class with a production of 1395.06 pounds butter in one year, and a third daughter made 1075.29 pounds butter in one year as a junior three year old.

**FINDERNE SOLDENE VALDESSA** ranks high as an individual, and his first crop of calves in our herd, a large percentage of which have been heifers to date, are straight, vigorous youngsters, nicely marked, and we consider them unusually good.

We invite you to visit our herd, and it will be well worth your while to consider a son of **FINDERNE SOLDENE VALDESSA** for YOUR herd sire. We have a very few youngsters to offer at present, out of good A. R. O. dams.

## Think!

And you will decide that your next herd sire MUST be backed by great YEARLY record of milk and butter. And when you look for a bull with such records behind him, find what we have to offer in young sons of

### PRINCE ALCARTRA KORNDYKE

our senior herd sire, whose dam is Tilly Alcartra, the world's greatest long distance producer, the only cow of

The first five daughters of **PRINCE ALCARTRA KORNDYKE** to finish yearly records as two year olds averaged 15,333 pounds milk and 675.92 pounds butter in one year, a showing equalled by only a very few bulls of the breed.

You need this persistent blood in your herd, and you can secure it by buying one of our moderately priced young sons of **PRINCE ALCARTRA KORNDYKE**.

The J. S. GIBSON CO.

Williams, Cal.

## Field Notes from the Live Stock Men

Notes from Many of California's Live Stock Pastures. Personal as to Breeders and Breed

Elliott-Brant Rancho, Owensmouth, has figured prominently in recently admitted official records of registered Guernseys. Some of the notable record makers are Princess of Meadowbrook, 14089.3 pounds of milk and 745.79 pounds of butterfat equal to 877.37 pounds of butter 85 per cent fat; Imp. Mahy's Nelly II du Douit, 14421.40 pounds milk and 676.60 pounds butterfat equal to 796 pounds butter 85 per cent fat; Nerio's Elsie Granger, a senior 3 year old, 10357.8 pounds milk and 188.11 pounds butterfat equal to 690.89 pounds butter 85 per cent fat; and Little Beauty 2nd, a senior two year old, 10480.13 pounds milk and 563.20 pounds butterfat equal to 662.59 pounds butter 85 per cent fat. These are all records for one year, and there are a number of fine records now in the making in this progressive herd of registered Guernseys.

Nattaline Walker, a heifer in the herd of registered Holsteins owned by Bridgford Company, Knightsen, recently freshened at the age of two years and sixteen days, and at this writing has over 20 pounds butter to her credit in seven days under official test, and promises to increase this somewhat. She has milked as high as 75 pounds in one day. She is a daughter of King Walker 5th, whose dam is the noted show cow and producer, Paula of Chagrin Falls 3rd, 751.40 pounds milk and 30.84 pounds butter in seven days, 23,657.6 pounds milk and 987.82 pounds butter in 362 days.

J. M. Christen, Contra Costa County, added a number of good registered cows and heifers to his herd by purchase in the Third Sacramento Holstein sale. Mr. Christen has been dairying with grade Holsteins and had built up a splendid herd of high grades through the use of carefully selected registered bulls for a number of years, and from now on will apply his knowledge and experience to the breeding and development of purebreds.

"Silos are Adapted to every portion of the state where corn or any of the sorghums can be grown and are as necessary to the highest degree of success as they are in Wisconsin, New York, Illinois, Nebraska, or any other state where thousands of farmers have proven them a necessary part of the farm equipment." Thus does W. A. Barr, county agricultural agent in Arizona, open his good bulletin on "Silos and Silage Crops for Arizona." And how well the place of the silo on the farms in all the western states is defined as "a necessary part of the farm equipment." California has already become a corn producing state of no mean consequence, the old fallacy of believing that corn would not mature in the state having been largely done away with, and there is no reason why Arizona should not likewise grow immense crops of corn. Livestock farming yields its greatest profits when conducted upon the principle of making the livestock market the home grown feeds, and no greater factor than good corn silage can enter into any plan of home grown feeds.

Imp. Donnington Goldie 5th, in the Edgemoor Farm herd of registered Guernseys owned by Walter H. Duppe, Santee, recently completed a splendid year's official test. She

freshened at the age of three years one month, and in one year made 17,861.7 pounds milk and 796.52 pounds butterfat equal to 937.08 pounds butter 85 per cent fat. Other recently completed records in the herd include Mambrino's Lura, 14,822.4 pounds milk and 721.60 pounds butterfat equal to 848.94 pounds butter 85 per cent fat; Florham Dame, 16,326.8 pounds milk and 685.83 pounds butterfat equal to 806.85 pounds butter 85 per cent fat; and Ultra Deanie, a senior 4-year-old, daughter of Ne Plus Ultra, 12,189.90 pounds milk and 614.66 pounds butterfat equal to 711.37 pounds butter 85 per cent fat.

H. E. Cornwell, Modesto, after selling off his females of milking age last spring, now has an exceptionally fine lot of registered Holstein heifers that will be heard from later. Many of them are daughters of Prince Hiske Walker, full brother to the state record junior four year old Lady Hiske Walker, 34.25 pounds butter in seven days, now heading the herd of Walter F. Mitchell, Visalia.

Lady Netheland Pontiac the new world's record junior four year old Holstein heifer in the seven days division, who recently made an official record of 43.52 pounds butter in seven days, again brings into prominence a number of other members of her family that have been central figures in great Holstein events of the past year. In the first place her sire, King Pontiac Konigen, is full brother to K. P. Diona Pietertje, 825.60 pounds milk and 40.15 pounds butter in seven days, who is the dam of King Segis Pontiac Konigen, the bull for which Mr. Fred F. Field of Massachusetts paid \$35,000 last summer, and she is also the dam of Majestic Rag Apple, the five months old bull calf that sold in the Dairymen's convention sale at Syracuse, N. Y., in December for \$35,000. The sire of the new record maker is also brother to King Korndyke Pontiac, owned by Fred W. Kiesel, Sacramento, and sire of King Korndyke Pontiac 20th, the young bull which W. J. Higdon secured in the Guaranty sale for \$6,500, and is also brother to the California state record senior two year old K. P. Tola Joe owned by Gotshall & Magruder, Ripon, whose 7 months old daughter was bought for \$1400 by J. W. Benoit in the Guaranty sale.

Tilly Alcartra, the most wonderful milk and butter producing cow the world has yet developed, freshened for her sixth time on December 27, dropping a beautiful heifer calf by Sir Aaggie De Kol Acme, son of the world's official record butter cow Aaggie Acme of Riverside 2nd. Tilly was never in better condition at freshening time, despite the fact that she has been put on yearly test every time she has freshened, and she is expected to add greatly to her fame this year.

Miss Valley Mead de Kol Walker increased her eight months after calving record given in a previous issue and now has to her credit as the world's record in the junior 3 year old class of the seven day division eight months after calving, 24.70 pounds of butter. Along with the butter record she made 452.70 pounds milk. This exceeds the former butter record held by FINDERNE Holingen Payne by 2.13 pounds. She is owned by A. W. Morris & Sons, Woodland, and is the dam of King Korndyke Pon-

When writing advertisers, mention The Cultivator.

tatic 20th, the young bull bought by W. J. Higdon, Tulare, for \$6500 in the Guaranty sale.

Geo. A. Murphy has two August boars that are good to look at. He says of one of them "He's the best boar in California," and he knows. They are out of Robins Ruby, who was first aged sow at the Panama-Pacific Exposition and grand champion at Sacramento state fairs of 1912 and 1914.

Maurice Rucker has sold his Ranch 13 at Fair Oaks and moved his Durocs to his new farm on the Causeway highway, two miles from Sacramento between that city and Davis.

H. L. and E. H. Murphy have a good bunch of one and two year old Short-horn heifers, a number of which will calve this month. Some of them are bred to a son of Cumberland's Type, Charley Saunder's great bull who won 36 grand championships under three years old.

H. L. and E. H. Murphy report many inquiries for highly bred stock in the Berkshire line and a number of satisfactory sales during December.

A sale of three Shorthorn bulls and six heifers to the Newhall Land and Farming Company has recently been made by H. L. and E. H. Murphy.

Iowana Counties 12th 231117 is a new arrival from Iowana Farms. She reached the farm of H. L. and E. H. Murphy early in December and will show as a two year old this year. She is well bred, sired by Iowana Rival Champion 3rd 194730, and is in pig to Iowana Champion Peer 3rd 184355. She has Double Champion, Star Masterpiece and Lord Premier Rival blood, is bred to Iowan leading herd boar and should have a classy litter. She is of medium size with good lines, broad face, good hams and strong heart girth.

Tulare Holstein Farm, home of the \$6500 bull King Korndyke Pontiac 20th, and owned by W. J. Higdon, has started the season's official testing well. Blanche Nudine Clothilde 2nd, a junior four year old granddaughter of King of the Pontiacs, has 27.24 pounds butter and 516.8 pounds milk to her credit in her first seven days on test. She was dry only three weeks before freshening and had no special preparation. Another junior four year old granddaughter of King of the Pontiacs, Princess Wynima Pontiac, made 22.32 pounds butter and 511.3 pounds milk in seven days, test begun three weeks after a severe ordeal at calving. This heifer is owned by H. E. Vogel, Fresno, who bought her in the Guaranty Sale and shipped her back to Tulare Holstein Farm to be officially tested. These are some of the first records made under the supervision of Henry L. Redd, who promises to make things hum as herdsman in charge of the fine bunch of cattle that Mr. Higdon has assembled as his foundation.

Bonita Stock Farm, Lodi, is showing some very consistent records with the registered Holstein cows and heifers recently brought out from the East. Among some of the records recently made are those of Canary Korndyke Queen 19.98 pounds butter in seven days, Pioneer Oaks Pet Fobes, 19.00 pounds butter in seven days, and Hazelwood Liscomb Aaggie Ormsby, 19.03 pounds butter in seven days, all of these being senior two year olds. Maid Pontiac Fayne, who dropped her first calf at just a few days past three years, made at this freshening the very good records of 479 pounds milk and 22.50 pounds butter in seven days.

Other records include Florressey De Kol Lawn 2nd, 20.09 pounds butter in seven days at four years, Cora Colanthus of Black Hawk, 499 pounds milk and 20.56 pounds butter in seven days at ten years of age, and Geneva Colanthus Hengerveld, 22.90 pounds butter in seven days at five years.

Henderson Company, Sacramento, has made some good official records in spite of very severe handicaps in the way of loss of men through military draft. One of the most interesting records is that of Lottie Walker Spofford 3d, daughter of the four time 30-pound cow Lottie Walker Spofford. As a senior three year old with second calf she made 533.5 pounds milk and 25.04 pounds butter in seven days with no preparation whatever and with a change of herdsman and milker in the middle of her test. She is a beautiful heifer and a most promising candidate for a large record. Two junior two year olds, Sunnyslope Duanna Pieter-tje and Korndyke Witkop De Kol 2nd made 22.46 and 19.64 pounds butter in seven days respectively. Lockhart Segis Walker made 21.98 pounds butter in seven days as a junior three, while Susie Fayne Walker made 25.70, Lyons Vevie Segis 20.17, and Maylntje 2nd 20.21 pounds butter in seven days as senior three year olds. Calypso Pontiac Aaggie made 25.70 pounds butter in seven days as a four year old. The gaps in the Henderson Company farm organization have now been filled by a new superintendent, herdsman and assistant herdsman, and things are moving forward on the big breeding establishment.

Ingnaro De Kol, the great Holstein sire whose blood has already profoundly influenced the progress of the Black and White breed in California, ranks as the leading sire of the breed for the high yearly records of his daughters. Out of 25 A. R. O daughters to his credit, 13 have yearly records averaging 21,009.78 pounds milk and 844.28 pounds butter, an average not approached by 13 daughters of any other sire. Possibly his most famous daughter was Aralia De Kol, the first cow in the world to produce 28,000 pounds milk in one year, and she has one daughter above 1100 pounds butter in one year and another one now making a record that will exceed 1100 pounds butter. Another of his daughters, the famous Juliana De Kol, was junior champion female at the St. Louis World's Fair, and at one time held the senior two year old world's butter record for seven and 30 days. Her blood is very much in evidence through her son Juliana King of Riverside, who is the sire of both the sire and dam of Aaggie Acme of Riverside 2nd, the world's official record butter cow for 305 and 365 days, and world's record for butter in two years either official or semi-official, and he is also the sire of the dams of Miss Valley Mead De Kol Walker, who now holds two world's butter records, and Lady Hiske Walker, 34.25 pounds butter in seven days as a junior four year old, and is one of the very few bulls of the breed to have three daughters with records above 1000 pounds butter in one year.

Livestock men throughout California will welcome the news that C. A. Briggs is once more in the field for the Cultivator after an absence during which he built a new house and barn on his small farm near Sacramento.

Registered dairy cows are so few in numbers as compared with grade and mongrel dairy cows that they belong properly at the present time only in the hands of skillful breeders who will

## Prince Riverside Walker

We bought Prince Riverside Walker to head our herd before his sisters made their wonderful world's records, and they are justifying the confidence we have in this combination of breeding.

PRINCE RIVERSIDE WALKER is sired by Prince Gelsche Walker, and is out of Aaggie Acme of Riverside, 28.35 pounds butter in seven days, 15,032.60 pounds milk and 808.32 pounds butter in one year.

Thus he is three-quarters brother to Miss Valley Mead De Kol Walker, 36.81 pounds butter in seven days as a junior three year old; 21.33 pounds butter in seven days eight months after calving as a senior two year old and 24.70 pounds butter in seven days eight

months after calving as a junior three year old, both world's records in classes. She also made 17,010.90 pounds milk and 790.38 pounds butter in 257 days as a senior two year old and will make close to 1100 pounds butter this year as a junior three.

PRINCE RIVERSIDE WALKER is thus also out of the same dam as Aaggie Acme of Riverside 2nd, 1331.41 pounds butter in one year under strictly official test, a world's record; 2426.78 pounds butter in two years, also a world's record. His dam's sire is one of the few bulls of the breed to have three daughters with records above 1000 pounds butter in one year, including the former world's record senior three year old Queen Juliana Dirkje, 1021.73 pounds butter in one year, and he is also the sire of King Mead of Riverside, the only bull of the breed whose daughters average over four per cent butter fat on yearly test.

PRINCE RIVERSIDE WALKER is siring extra good calves. Big, vigorous, well marked, and a very high percentage of them heifers. We have only a limited number of his bull calves, all out of good dams, and priced well within their value. Write for descriptions and prices or better still, visit our farm and make a selection.

## REGISTERED HOLSTEINS

No greater conservation of feed, labor, and money can be made by the dairyman of today than by placing at the head of his herd the right kind of a herd sire.

A registered purebred Holstein bull of good breeding will get the kind of heifers that develop into profitable dairy cows, able to convert the feed they consume into profitable milk and butter production. The overhead expense, including labor, of handling a GOOD dairy cow is no greater than for a boarder, and the only way to breed GOOD cows is to use a GOOD purebred registered bull.

Right now we are offering a limited number of GOOD young bulls sired by

### MERCI LAD KORNDYKE BURKE

conceded to be one of the greatest individual Holstein bulls in the west, and as to his breeding—

He is sired by the noted individual and sire De Kol Hengerveld Burke, one of the greatest sons of De Kol 2nd's Butter Boy 3d, and his dam is that wonderful producer Winnie Korndyke Cornucopia De Kol, 31,034.14 pounds milk and 1201.06 pounds butter in one year, the first cow in California to produce over 1200 pounds butter in one year.

MERCI LAD KORNDYKE BURKE is siring a wonderful lot of calves. Come and see his beautiful sons and daughters and we feel sure you will decide to select one of his young sons to head your herd.

Inquiries or orders by mail will receive prompt attention.

test them, cull closely to the best families, and thus produce the highest class of purebred bulls to go out and improve and breed up the common herds. But the day ought to come when purebred dairy cows will make up the bulk of the dairy herds of the country. The selective process that has produced the purebred dairy cow of today has gone far toward the elimination of low producers and the chance of breeding low producers, and a dairy herd of purebred cows is therefore a sound foundation upon which to build the business of a commercial dairy, aside from the greater value of the increase.

The Henderson Company of Sacramento have been making sales of some high-grade Holsteins. Probably the most noteworthy sale was to Moreing Brothers, whose farm is near Stockton. The purchase price was \$1,500 for the two following bulls: Manteca Walker Spofford Lyons, No. 211,366, born September 29, 1916. His sire was Judge Lyons, the herd sire of A. A. Hartshorn in Syracuse, New York, and the dam is Lottie Walker Spofford III, No. 256,340. This young bull's 13 nearest dams averaged 29 pounds butter in seven days. His dam is a splendid young cow of our herd, who made 21 pounds of butter in seven days as a junior two-year-old. She is a daughter of the famous Lottie Walker Spofford, and the King of the Black and Whites. The other sale was of Manteca Korndyke Supreme Glista, a son of Supreme Glista Pietje and Mollie Korndyke Hengerveld.

The Veramont Stock Farm, owned by H. M. Barngrover of San Jose, is building up a fine herd of Herefords. The latest purchase is 33 head from Snyder of Oregon. The foundation of the Snyder herd was purchased in Kansas City some years ago at exceptionally long prices. Mr. Barngrover now has 75 head of Herefords on his Plumas County ranch. He already has his eye on some which will be winners at the next state fair.

F. H. Everson, manager of the Lake Mills Holstein Breeders' Consignment Sales Company, writes that the dates of May 1 and 2 have been chosen as those of the coming spring sale, which is one of the great events of the Middle West live stock happenings.

T. J. Gist & Sons of the Holberk Stock Farm have just completed offi-

cial test on four of their registered Holsteins as follows: Bonny Spot Foot, 214,907, made 21.28 pounds of butter; Holberk Hengerveld Pietertje, 326,929, 15.4 pounds as a two-year-old; Lady Belle Hengerveld Pietertje, 267,952, 20.43 pounds; Gleesome Girl Belle Finale, 214,907, 21.22 pounds. This ranch has also just received a registered Percheron stallion from D. B. Adams & Son of Modesto, which they consider one of the best around Tulare. This horse won several prizes in Illinois, Oklahoma and Missouri, and also won first at Modesto in 1917.

R. K. Walker, secretary of the Southern California Duroc-Jersey Association, will make a trip to the Duroc-Jersey herds of the Middle West during the last part of January and February to select breeding stock for the California breeders. Many Western breeders are taking advantage of this opportunity to secure Eastern blood without having to rely on mail orders.

R. C. Sturgeon is planning for a model stock ranch in Ventura County. He will breed pure bred Holsteins and Duroc-Jerseys. Mr. Sturgeon has some classy Durocs and hopes to make an importation of more of the finest from the best Eastern breeders. Holsteins already in Tulare County will be the nucleus for a fine bunch and to it he hopes to add still more blue ribbon winners. Interest in the Holsteins is increasing in this state as never before and we are glad to see Mr. Sturgeon add to Tulare County's pure breeds.

E. E. Greenough, Merced, reports sale of splendid young bull to C. E. Markey & Son, at Fowler. He was by Lorna's Exile King with 691 pounds butter record, and Mae of Venadera, his dam, has a record of 432 pounds fat.

#### MIDWINTER POULTRY SHOW

## As They Used To Do

A Quotation from an Old Book—the First Report of the United States Department of Agriculture for 1862.

FIFTY-SIX years is not so long a time, but it is most interesting to look back and see how the poultry fancier regarded the industry, or, per-

haps more properly, how the utility poultry man regarded the possibilities of poultry from a commercial standpoint. Hence, it is interesting to look into the report of the department of agriculture, the first report made in this country, bearing date of 1862. The department was organized as a branch of the patent office as directed by enactment approved by President Lincoln, May 15, 1862. There are many interesting features in this report, touching upon almost every branch of farming as then conducted in the United States. Two writers discuss the matter of "Raising Poultry and Eggs for Market" which was written by "A New Englander" and "Poultry" by D. S. Heffron of Utica, New York.

As will be noted below "New Englander" scarcely touches varieties of

ment in a familiar manner, and to offer for the benefit of the farmer, the breeder, and the amateur, certain facts and hints acquired by the writer through long experience with, and a careful observation of the habits, wants, and characteristics of domestic fowls, and to point at the probable profits attainable by breeding poultry and raising eggs for ordinary market purposes.

"The common fowls of the country are at this time, of course, in great excess of numbers over any and all of the 'fancy' breeds of late introduced among us from abroad.

"Yet it is a noticeable fact that, by means of the importation of foreign blood, made within the last dozen years, and especially through the introduction of the large Chinese variety (*Gallus giganteus*) amongst our farmers and poulterers since 1850, the distinctive characteristics of this race of birds are now very widely disseminated among the domestic fowls of America; and it would be unusual at the present day to meet with the flock in our farm-yards or poultry-houses about the country where the marked features of the Chinese race of fowl are not to a greater or less extent visible.

"That the mixing of this foreign

As They Built 60 Years Ago

Reproduced from old wood cut used in report of the Department of Agriculture of 1862 showing a poultry house "in use for several years and found admirably suited for sitters and layers. The glass may be double in order to get better winter protection."

poultry other than the ordinary barn-yard type, excepting to commend more general use of the Chinese varieties to give greater size to the ordinary domestic fowls of America. But Mr. Heffron touches upon the Asiatics, refers to the Hamburgs, the Polish Games, Dorking, White Face Black Spanish, Minorcas, Andalusians, and Leghorns, the last three all coming under one class, as having many characteristics in common. "The Dominique is the best fowl of the common stock that we have, and is the one fowl in the country that has enough distinct characteristics to entitle it to a name. Then on the side a short description is given of the Creepers, the Rumpless and the Silks.

As to laying capacity, we note: "The Hamburg hen has been known to lay 240 eggs in a year, a greater number than any other variety, but her eggs are quite small, weighing only a little over an ounce."

But the matter in this old book is so interesting that we quote verbatim several paragraphs:

"A great deal has been written in the few past years on the subject of advantageously breeding, keeping and fattening poultry and producing eggs for market. Many suggestions and numerous theories have been presented to the public through the medium of books and the press of our own and other countries upon this theme; and much of the information and advice thus promulgated has been of a visionary and impracticable character, though, at the same time, no inconsiderable amount of valuable information has thus been elicited from actual experiments made public regarding this agreeable and now highly important pursuit in rural life.

"It is the object of the present paper to present the results of a long, practical experience in this depart-

ment with that of our native races of domestic birds has proved of great advantage, no one who has bred poultry extensively in the last 12 or 15 years will deny; and whether we consider the item of increase in size and weight, at a given age, attainable with certainty through this crossing of stronger foreign blood upon our native breeds, or that of the well-decided advantage thus attained in the enlargement and increase in weight and the number of eggs obtained from the product of this crossing, the general gain by the process is most clearly in our favor. It is, therefore, but truthful to premise that the mixture of the Chinese blood with that of the common fowl of the country has proved of great benefit, and the continuance of the practice will be found of corresponding advantage in raising poultry for the market, inasmuch as the product of the crossing matures much earlier than does the old native stock, thus giving, within a shorter period, more pounds of flesh in good season; while for the producing of eggs, the half bloods are known almost uniformly to commence laying at a much earlier age than the common fowl, thus affording us eggs abundantly at from four and a half to five and a half months old, and afterwards. For these reasons the writer fully agrees with a recent English author of reliability and experience that the introduction of the new races of fowls in late years 'has resulted unquestionably in diffusing over the country greatly improved breeds of this interesting and useful kind of live stock; that more judicious modes of treatment than were formerly practiced have been made known; and that our markets certainly will by this means henceforth be more fully supplied with both eggs and fowls of a vastly superior quality'.

The above is from the article, "Raising Poultry and Eggs for Market." A few other sentences taken at random are quoted.

"In raising poultry, whether the object be to produce chickens for the market or to obtain a supply of eggs,

the first principle to be observed is absolute cleanliness in and around the houses they occupy."

"If the fowl houses are kept thoroughly dry and clean, and the poultry free from vermin, there will be but little sickness among the chickens. When the case occurs, however, remove the bird that droops at once, knock it on the head and bury it beneath the roots of the grape vines. This will be a profitable and effectual riddance of sick fowls. Robert Scott Burn, in his 'Lessons of My Farm,' very rightfully asserts that 'the cure

A Beauty and a Doer  
Ancona Cock heading first pen owned by Hocking Poultry Farm, Los Angeles.

of disease in ordinary fowls is not worth attempting, and the best way—mercilessly, or rather mercifully—is to devote the sick bird to the hands of the executioner."

"Good range, pure water, dry shelter, animal food, and entire freedom from filth are all needful."

"The calculation here made as to returns in eggs is set down at an annual yield of 140 eggs to each hen."

"The secret of having hens to lay in winter, lies not (as asserted by some) so much in feeding them particularly, at that season, as in the simple fact of hatching the pullets in the right month of the year to bring them to maturity in the fall."

"Common barn-yard fowls, without extra feed, do not reach their full size before they are about 18 months old."

"To raise large fowls of any kind, have the chickens hatched early in the season, feed often and give a variety of nutritious food, until they get well started, and the more liberally the young are fed during the first season, if they always eat up all that is given them, the more satisfactory will be the results."

House the flock comfortably; keep houses dry and well ventilated, allowing plenty of fresh air and sunshine.

Early hatched chicks have the advantage of a longer and better growing season.

Early hatched pullets produce more winter eggs and return the greatest profits.

Remodel the old house—stop cracks and eliminate drafts.

### The Egg Contest

**A**N INTERESTING feature of the 1918 Poultry Breeders' show was the "Egg Contest" under the management of F. P. Battle.

The judging of the 15 or more lots of eggs was handled by Messrs. M. A. Schofield, F. W. Foster and B. R. Holmoway, all experts in egg production.

In this contest the American Standard requirements as to plumage, condition and shape are ignored; while on the other hand egg type and uniformity of color of fowls and weight, color, structure, uniformity of size and food value of the eggs were taken into consideration.

The selection of the flock as to egg type, proper method of feeding and

proper feeds are the fundamentals of success in the production of eggs, which is the profitable branch in the poultry business.

The results of the contest showed the Blue Andalusians, first; White Oringtons, second; Rhode Island Reds, third; Plymouth Rocks, fourth; Ovo Grande, (a new variety), fifth. The last named scored the highest weight with 12 eggs weighing 34½ ounces or 12½ ounces more than the average grocery egg weight.

All scores and rules were withheld; but after careful consideration by experts, a printed set of rules and score cards will be furnished at the next exhibition. The proceeds from the auctioned eggs in the contest were turned over to the Red Cross.

### Selection and Care of Poultry Breeding Stock

**O**NE of the prime essentials in poultry breeding is to use only strong, vigorous, healthy stock. It is only by continuing to do this that a flock can be built up which will have strength and vigor and which will produce strong, fertile eggs, strong chicks capable of making quick growth, and pullets with sufficient stamina to stand the strain of heavy egg production. The appearance of a bird is not always a sure indication of its vigor, but appearance and action taken together are a fairly reliable basis for picking out vigorous birds. The comb, face, and wattles should have good, bright color; the eyes should be bright and fairly prominent; and the head should be comparatively broad and short, not long and snaky or crow headed. The bird should be alert and have a vigorous carriage. The legs should be set well apart and strongly support the body, with no tendency to weakness or a knock-kneed condition. The bone as seen in the shanks should be strong, and not too fine for the breed. The plumage should be clean and smooth. Lack of condition often accompanies soiled, roughened plumage. Fowls that have been sick but apparently have recovered should not be used for breeding if it can be avoided.

**Purpose of Breeding**

In selecting stock for the matings the purpose of the breeding should be kept clearly in mind. If the desire is to produce exhibition stock, birds should be selected that are nearest the standard in type and markings or that will combine their qualities to produce offspring most nearly approaching the standard. If the desire is to produce table fowls, birds that have a body shape suitable for carrying an abundance of meat should be selected as breeders. They should be broad and deep of body, have good length both of back and keel and especially a broad breast well covered with meat. If the desire is to produce stock for eggs, birds should be chosen as far as possible that are good egg producers or are the sons or daughters of good egg producers.

**Time to Mate**

Matings should be made at least two weeks before beginning to save eggs for hatching. If less time is allowed, the maximum fertility is not likely to be assured. It is often desirable to mate even farther ahead than two weeks so that a few eggs can be incubated for five or six days to see whether they are fertile. If these eggs are not fertile, there is still time to change the male bird and thus insure fertile eggs for the earlier hatches.

**Size of Matings**

The breed influences the size of the matings. Under yarded conditions it is usual and desirable to run from 12 to 15 females of the lighter type, such as the Leghorns, from ten to 12 females of the general-purpose type, such as the Plymouth Rocks, and from eight to ten females of the heaviest type, such as the Brahmas, with one male. Where the breeding fowls have free range and the male is strong and vigorous, it is possible to obtain fertile eggs from a considerably larger

Mike  
A winning Barred P. Rock owned by H. L. Gill, Tropic.

flock of females. A vigorous Plymouth Rock cockerel on free range should give good fertility when mated to 20 to 25 females, while a Leghorn male under the same conditions can be mated successfully to 38 to 40 females. If eggs for hatching are desired from a flock too large for a single male to fertilize, two or more males can be run with it either at the same time or by alternating the males on successive days.

**Age of Breeding Stock**

Pullets or hens, cockerels or cocks can be used in the breeding flock. Hens, however, are to be preferred to pullets because they lay larger eggs and seem to give better fertility and stronger chicks. Yearling and two-year-old hens are to be preferred to older hens. Any birds, either male or female, that have proved to be especially valuable breeders should be retained as long as they will breed.

**Free Range for Breeding Stock**

If possible, the breeding stock should have free range. It is better if this be provided during the entire fall and winter before the breeding season; but if this be not possible, free range just preceding and during the breeding season will be of great value. Birds on free range will give a higher fertility, better hatches, and stronger chicks.

**LAYNE & BOWLER PUMPS**

**Dependable Water Supply at Your Command**

Don't take the risk of losing your crops, or lowering your crop production by trying to get along with an insufficient water supply. Install a Layne & Bowler pump and you will have assurance that your troubles will be minimized and you will get your water at the time you want it. Every rancher should prepare now to raise the biggest crops during 1918. Crop prices will be high. Write for catalog No. 30 immediately. It's free.

**Can Furnish You with USED GASOLINE ENGINES such as are Practical for WOOD SAWS, CREAM SEPARATORS, PUMPS, GARDEN TRACTORS and all other RANCH APPLIANCES where Motor Power can be Used.**

These motors range from one cylinder 1½ horse power to four cylinder 18 horse power. Space will not permit details—enough to say they are practical for all ranch purposes, and range in price from \$15.00 to \$100.00. A postal card will bring full information. I will guarantee each motor to give satisfaction for its purpose or no shipment will be made. Let T. E. Berry solve your small engine wants.

**ALSO Thor Motorcycle Distributor**

Will furnish you parts for any make of motorcycle. All parts mailed C. O. D. subject to your approval. New or used parts. Write for my bargain list on used motorcycles, parts and sundries. We are agents for CYGNET REAR CARS for motorcycles. New and used motorcycles on easy terms. Rider agents wanted on Thor motorcycles.

# Poultry can be made to Pay

**T**HERE are two methods of gaining knowledge, necessary to make poultry a success; experience—which is a long, drawn out, expensive road and the one too commonly used. Another method is by the careful studying of books written by practical poultry people who have made mistakes and successes and are willing to give this information in order that you may take the short road to poultry success.

## Poultry for Profit

BY

Jean A. Koethen

Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on egg-shell book, binding full cloth vellum de luxe.

## A Paying Poultry Ranch

Written for California Cultivator by Jean A. Koethen

OOD laying stock, convenient and sufficient equipment and judicious feeding are the three factors which make for success in a modern commercial poultry ranch. Lack of one of these is at the bottom of a majority of the failures which are so frequently pointed out as proof that poultry "doesn't pay." The ranch known as the L. E. Bliss poultry ranch of Van Nuys, now owned by L. T. Keefauver, is a conspicuous example of the fact that success is not a matter of luck, but depends very largely on equipment and management.

The Bliss or Keefauver ranch is not one of the largest. It covers two acres of ground and provides house room for about 3,000 layers, though the number carried at present is somewhat under the full housing capacity, being about 2,300 birds, half hens and

long and contains five sections 12 feet wide, with a maximum capacity of 100 Leghorn hens. That the number allowed is from 75 to 85 hens instead of the maximum capacity speaks well for the judgment of the owner. Each house is fully equipped with hoppers and feeders and automatic fountains, and a notable exception to the small single yard plan of most commercial ranches—each house has two yards. It would be difficult to estimate the exact size of these double yards, but they looked about the size of an ordinary city lot. The object of this double-yarding system is not to provide forage for the hens. That, with so large a number, is impossible. It is rather to provide for growing a green crop and at the same time purifying the yards. While the hens run in one yard a crop of barley is growing in the other. When this has

A Producing White Leghorn

half pullets. As is the case with an increasingly large number of commercial ranches, no male birds are kept. Baby chicks are bought from the big nearby hatchery, and the cockerels are sold for broilers as soon as they are old enough. This simplifies the care of the stock, does away with the expense of feeding males and leaves more house room for the pullets.

As this ranch is planned as a one-man or one-family ranch, where the work is done by the owner with such help as his family can give, the greatest care has been used to save steps. The six laying houses, all facing south, are arranged in two rows of three each, with an alley behind the first row and in front of the second, so that feed may be carried through in a wagon from one end to the other. Along the back of the houses in the front row is a series of grain bins which can be easily reached with the wagon, thus doing away with the need for a large and expensive feed house. Between two of the houses of the front row is a cemented floor, roofed over. Here is the clover cutter for preparing the green feed, with its little gas engine. Here are also pails and tubs for mixing the moist mash and the big barrel of semi-solid buttermilk, and here, against one wall of the adjoining house, is the alarm clock which turns on the electric lights in all the houses at 4 a. m., so that the hens may get busy while the owner takes his morning nap. From this cement mixing room it is but a few steps to any one of the houses.

Each of the six houses is 60 feet

reached a suitable length for running through the clover cutter it is cut, and then, when all has been cut that can be, the hens are turned on to nibble at the roots and the other yard is planted. The barley in these runs and a good-sized patch of alfalfa furnish the greens that keep these hens singing and laying.

There are two brooder houses, each provided with a large brooder stove and each with accommodations for 1,500 chicks. Early in February these houses will be cleaned and prepared for the two lots of chicks which are ordered for the 7th and the 28th. "We believe in early hatching," said Mr. Keefauver, "for that is the only way to get fall eggs. The pullets may molt a little, but we will get more eggs than we would if they were hatched later." A particularly good feature of these brooder houses is the arrangement of the windows, which are along the south side and reach from the floor to a height of perhaps two or two and a half feet above it. The glass in these windows is removable and may be put in so that it closes the window tightly or at an angle so that it lets in a current of air above. With these panes of glass so adjusted there can be no draft on the floor where the chicks are, and yet a continual current of air from the top of the window to the air shaft at the side of the room keeps the air more nearly pure than is possible in most cases. Ventilation is always a problem when a large number of chicks is brooded in one room, and this method of providing air has proved very satisfactory.

As the place has been in Mr. Keefauver's hands only a month, he has followed his predecessor's method of feeding with few changes. A commercial dry mash is kept before the hens in hoppers at all times. The first meal of the day is the ration of scratch grain, which has been scattered in the straw on the floor the night before. This mixture consists of equal parts rolled barley, Egyptian corn and milo. By the time Mr. Keefauver comes out this scratch grain has been pretty well cleaned up and the hens are ready for the green cut up barley or alfalfa with which their troughs are filled. Soon after noon a moist mash is given. This consists of equal parts bran, alfalfa meal and the dry mash mixture which is fed in the hoppers, moistened with semi-solid buttermilk and water. This semi-solid buttermilk is a product of Kansas dairy farms and is being quite largely used by Van Nuys poultrymen. It is much cheaper than California buttermilk and just as satisfactory. The alfalfa meal is an experiment, and Mr. Keefauver has considerable doubt of its value as a poultry feed. It does no harm, but he has not yet found that it brings results. The evening meal consists of sprouted barley.

The eggs from these 2,300 hens during the month of December sold for \$200 above cost of feed. As all the work is done by Mr. Keefauver and his family, this is practically all profit, or salary, whichever one likes to call it, and is sufficient proof that poultry can be made to pay, even in war times.

Eliminate the male bird at end of hatching season. Fifteen million dollars is lost each year by allowing the rooster to run with hens during the summer months. Produce infertile eggs. Dispose of the male bird not later than June 1. Market a better quality of eggs.

**BUTTERMILK  
ADDED**

THE U. S. GOVERNMENT AGRICULTURAL EXPERTS have proven that buttermilk prevents and cures White Diarrhoea and is of great importance in poultry feeding.

Send to U. S. Agricultural Dept. Station, Berkeley, Cal., for Bulletin 162 (free) explaining the value of buttermilk to poultry.

Globe A-1 Buttermilk Mash is a food poultry like and eat in preference to grain.

Costs no more than ordinary mash, but it's worth more because of the DRY BUTTERMILK added.

Sample and valuable feeding information free.

## Egg Laying Contest at Storrs

Storrs, Connecticut, January 2, 1918.  
—Report for the ninth week ending January 2.

It is almost unbelievable, but nevertheless a fact that the hens in the laying contest at Storrs produced 56 more eggs last week than for the previous week and nearly 170 more than for the corresponding week last year. The hens were all in fine condition and were expected to make rapid gains under any ordinary weather conditions. Instead of this these birds have withstood a solid week of the lowest temperatures on record. The ninth week of the laying contest constitutes the most intense and protracted cold wave during the past 28 years. A vivid idea of actual conditions is readily obtained from the subjoined table showing the official minimum temperatures during the last contest week.

Friday	.....Dec. 28	Zero degrees
Saturday	.....Dec. 29	3 below
Sunday	.....Dec. 30	17 below
Monday	.....Dec. 31	13 below
Tuesday	.....Jan. 1	8 below
Wednesday	.....Jan. 2	9 below
Thursday	.....Jan. 3	7 below

It will not be surprising to poultrymen to learn that a large number of birds had their combs and wattles frozen and of course, the Leghorns and other light breeds fared worse. Of the Rocks, Reds, Wyandottes and Orpingtons, 17 per cent of the birds had their combs frozen and 13 per

cent had their wattles frozen, whereas in the light breeds, 76 per cent of the hens froze their combs and 16 per cent froze both their combs and wattles. In other words, of the 100 hens in the contest, nearly one-third of this number have both frozen combs and frozen wattles. Obviously the management of the contest does not dare to predict what will happen to the egg yield during the next week or two. Meanwhile every bird with a frozen comb has been treated with a mixture composed of five parts of vaseline, two parts of glycerine, and one part of turpentine.

The three best pens in each of the principal varieties are as follows:

### Barred Plymouth Rocks

Jules F. Francis, 318; Rose Rock Farm, 237; Rodman Schaff, 183.

### White Wyandottes

Brayman Farm, 286; Obed G. Knight, 283; J. Frank Dubois, 236.

### Rhode Island Reds

Pincrest Orchards, 295; Flintstone Farm, 227; Richard Allen, 183.

### White Leghorns

Braeside Poultry Farm, 282; Hollywood Farm, 281; J. Frank Dubois, 246.

### Miscellaneous

Cook & Porter, (Buff Wyandottes), 304; Oregon Agricultural College (Orpingtons), 270; Dr. N. W. Sanborn, (Buff Wyandottes), 204.

## Turkeys and Alfalfa---Good Combination

Turks Fatten on Grasshoppers—Alfalfa Fattens Without Them

**T**HE value of a flock of turkeys to the alfalfa grower can hardly be estimated, says M. E. Kinsey of the Agricultural Extension Service of Arizona. He adds: The result of their work is appreciated by some of the men who have used them in hay fields that were being badly damaged by grasshoppers.

The birds should be allowed free range in the fields, especially early in the season in Southern Arizona valleys, possibly as early as the last of February, in order to catch the young hoppers when they commence to hatch. They are eaten more readily at this time and are destroyed before they have a chance to do any damage to the crop. The flock should not be left in the field too long as they will trample the alfalfa after its gets good growth. It is much better to range them for a time after each cutting, removing them as soon as there is enough growth to make possible any damage. In this way, besides lessening the damage to the hay crop, there is less growth on the ground for the young hoppers to hide under and the work of the turkeys will be more thorough.

The flock should be large enough to provide one bird to the acre. Sometimes, if the infestation is severe, it may be necessary to provide three or four birds to the acre. Aside from the benefit to the alfalfa, there is the added profit of the turkeys, which do well and grow fast on this kind of free range. Alfalfa and turkey raising go hand in hand, and profit and material benefit can be realized from such a combination. If you have had any experience with grasshoppers in the past year, give the turkeys a trial. The cost will be small and it is much

easier to let them do the cleaning up than it is to have to apply poison bran-mash after damage has been done to the crop.

### BUYING DAY OLD CHICKS

The business of hatching day old chicks continues to grow. Many poultrymen prefer, where they can secure well hatched chicks from eggs of dependable stock, to avoid the trouble of incubator handling, but we believe it is wise for those who follow this practice to arrange at once for securing their stock for the coming season. Feed is too high to waste any of it on indifferent stock. Only eggs from strong constitutioned birds should be used, and the earlier buyer should be able to contract for only such chicks.

L. B. Cary is highly gratified by the winnings of his Cornish fowls at recent poultry shows. They made winnings at Fresno, Modesto, and at the Mid-winter state show held at Colinga his birds won one and four on cock, one and three on cockerel, one, three and four on hen, one on pullet, and one and two on pen, and amongst the specials, gold sweepstakes, best display egg class, gold special champion cock, cockerel, hen, pullet, pen and English class—altogether, 22 awards.

Green feed is excellent for poultry and can be substituted for a considerable amount of the grain ration. Grow oats, vetch, and rape for summer use; cabbage and mangel beets for winter. Store cabbage and beets in a dry room or bury in a pit and cover with straw and earth.

Hot weather retards the growth of young chicks.

# HATCH EVERY EGG

"Why gamble with valuable eggs and more valuable time experimenting with an incubator—learning to run it? It's business with you from the start with a Buckeye Incubator, because all the experimenting has been done for you.

"You don't guess on the hatch, you get it—to the full number of hatchable eggs the first time and every time. And good strong chicks too, that grow to quick maturity."

Whether you are a beginner or a big operator, your problem is the same—to get the full hatch of strong chicks. A hatch of weak chicks is worse than none. Their care is a waste of feed and time. You avoid the risk and waste with a

## BUCKEYE

THE PERFECT INCUBATOR

The universal satisfaction of over half a million Buckeye users, big and little, proves that there is absolute certainty of success in hatching. Endorsement of the Buckeye by all the Agricultural Colleges and Experiment Stations removes all possible doubt.

It is built up to a standard, not down to a price. Up to such a high standard of correct principles and exact performance that we place behind it an unqualified guaranty.

### A Guaranty That Guarantees

The Buckeye is guaranteed to hatch more chicks and stronger chicks than any other incubator; to operate satisfactorily in any temperature down to freezing; to require no artificial moisture and no attention to the regulator from the time the hatch is started until it is finished. Any Buckeye that fails to meet this guaranty will be taken back any time within 40 days.

We want you to put your Buckeye to a test with any machine. We want you to know for yourself that it is the best in the world. Our guaranty is behind the first hatch and every hatch.

**Write for Catalog.** It contains the most wonderful lot of testimonials from Standard Colony Brooder users telling how they invariably raise from 90 to 95 per cent of their hatches in this wonderful brooder. Write a card for the catalog.

### TREES

**For Sale**—Extra fine Valencia trees, ½ to 1½, all sour root, high buds, very thrifty, clean and straight, not fertilized, excellent soil for balling, nothing better grown. Can supply a limited acreage yet closing out entire lot of these fine trees. S. R. Coate, 564 S. Los Angeles St., Anaheim, Cal. Phone, Anaheim Pacific 403-J.

**Eureka Walnuts are the Best**—Grafted on native black roots. We also have some grafted on paradox roots, which means a hardy root system and a very prolific grower. Prices reasonable, write today, tomorrow never comes. Geyer Bros. Walnut Nurseries, 214 S. Alhambra St., Alhambra, Cal.

**Here Is Your Opportunity to Secure A-1 citrus trees.** We offer several thousand 2-year-old lemons: Eureka and Villa Franca, also Washington navel; also several hundred Valencia on sweet root. We call these good trees and we know whereof we speak. ALBERT JACKSON, Upland, Cal.

**For Sale**—Fancy and standard varieties of Grafted Walnuts and Pecans. Largest variety of Walnut grafting wood in U. S. We are the oldest and most extensive propagators of walnut varieties in the U. S. Prices reasonable. Tribble Brothers, Lodi, Cal.

**Let Us Show You Our Ideal** twelve hundred acre orchard from which these perfect yearling citrus trees were propagated. Healthy straight stock, budded one foot high on sour root growing in our own nursery. References: R. R. Morris, East Whittier, Cal.

**For Sale: Citrus Trees**—Choice stock, young and thrifty. Selected buds, Valencia and Washington Navel, Eureka and Rio seedless lemon. Marsh seedless grapefruit; also young seedlings. W. W. Burns, 631 Security Bldg., F. 3110, Los Angeles.

**Placencia Perfection Walnut Trees** on black root. Still have a limited supply of first class stock. Scions used in grafting taken from trees showing a high record for crop and quality after seven years of careful selection. Hugh T. Thomson, Orange, Cal. Phone 502R1.

**Walnut and Almond Trees**—Mayette, Franquette, Concord, and Willson Wonder on Northern California Black root. Texas prolific and Drake seedling almonds on almond root. Stock is first class, cannot be better. Write for prices. Ekstein Nurseries, Modesto, Cal.

**For Sale**—5000 Royal Hybrid and Black Walnut trees, two and three years old, ½ to 1½ inch caliper, 3 to 8 ft. Also Grafted Eureka and Eureka grafting wood. John Miller, R. F. D. 4, Box 278, Lodi, Cal.

**Pear Trees**—Offer several thousand Bartlett, 2 and 3 feet, heavy caliper at 9c each. French prunes. Trees of all kinds. No agents; we sell direct. Write for price list. Carlton Nursery Co., Carlton, Ore.

**By Far the Lowest Priced** means of reaching a buyer for what you have to sell is through classified advertisements in California Cultivator. The cost is only 3 cents per word per issue, with a minimum of 35 cents.

**Valencia, Orange and Eureka Lemon trees** one year past, ¾ to 1 inch. Pedigreed stock on sour root, high buds. We will bud 6000 choice seedlings to your order. Seed bed stock for sale. Randall Bros. Nurseries, Whittier, Cal.

**100,000 Sour Orange Seedbed Trees**—50,000 sweet; choice new stock. Trees lined out this year sure to hit high market. Better plant a few thousand next spring. Southland Nurseries, 1941 East Colorado, Pasadena.

**For Sale**—1000 each Mission and Manzanillo olives ¾ to 1½ in. caliper, strong vigorous, clean trees, 20c each, in nursery. Roy R. Mathews, Buena Park, Cal.

**My Olive Trees** are selected for bearing qualities, also avocados, feijoas, citrus and deciduous trees. Bishop's Nursery, Highland.

**Olive Trees**—Mission, Manzanillo, Ascolano. Propagated by me from trees of known bearing qualities. Guaranteed. L. T. Schwacofer, Hemet, Cal.

**For Sale**—25,000 sour and sweet seed bed stock from 3 to 20 inches. Fine clean and healthy stock. One year old. John L. Preston, Anaheim, Cal. Home 1472.

**For Sale**—3500 Valencia, 2500 Eureka Lemons. Young trees. Select fruit buds. Reasonable prices. H. Clements, Glendora.

**Citrus Trees**—All kinds, any quantity. Butler's Morning Side Nursery, La-Manda Park, Cal.

**Walnut Trees**—Placencia Perfection, selected grafts guaranteed stock. Wm. Pollard, South Pasadena, Cal.

**Fig Trees**—Thrifty, large Callmyrnas and Capris. Correspondence invited. C. A. Nelson, Exeter, Cal.

**Apricots, Olives, English Morello Cherries and Arizona Ash.** First class trees. C. E. Moyer, Hemet, Cal.

**Florida Sour Orange seedlings**, year old. Write for details. Katsuragi, 23rd St., Upland, Cal.

**Apricot Trees For Sale**—A choice lot. Carsten Truelsen, Nurseryman, Hemet, Cal.

**Citrus Nurseries**, Murphy Oil Company, East Whittier, California. Selected stock for sale, inspection invited.

**For Sale**—Eureka Walnut grafting wood. R. M. Fay, R. D. 4, Anaheim, Cal.

### HOGS

**The Billiken Brand of Chester Whites**—There is right now a big shortage of swine in California. The output of 1917 will show even a greater shortage unless the farmers of this state get busy and raise more hogs. Good breeding stock is scarce and hard to get. THE BILLIKEN BRAND represents the best obtainable; they are of that mellow type that mature early and are such satisfactory easy feeders. Get started with this strain and help out the Food Administration and your own pocket as well. Write me your wants—do it today. I can still furnish first class animals at reasonable prices. C. B. Cunningham, Mills, Cal.

**Grape Wild Farm Berkshires and Guernsey Bull Calves**—Only a few more boars left from 6 months to a year old, sired Grand Leader 2d, the Grand Champion of the world. Also a few of the tops from our fall litters by Royal Superbus and Fashion Longfellow 27th, and a few bred gilts. Our herd won the Premier Breeder's Ribbon at the P. P. I. E. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

**Bernsteins Herd**—"One of the Best in the West" has three great herd boars. King's Big Bone Leader, Young Jumbo, and King's Massive Orange. Watch for the sensational offering of sows bred to this great trio which sell in the Big sale of the Kings' County Poland-China Breeders at Hanford, February 20. Bernsteins Ranch, Hanford, Cal. W. Bernsteins, Proprietor.

**Large Type Poland-Chinas**—The hog for the farmer if he wants to make money. I have the best lot of weanlings that I have ever seen and they are sired by my boar, Long Smooth Jumbo and if he keeps on growing the way he is, his name will soon be too small. H. Christiansen, R. D. 4, Riverside, Cal.

**Superba, World's Grand Champion Poland-China** boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

**Berkshires**—First prize junior boar; first and second senior boar pigs including junior champion; fifteen spring and fall open gilts sired by Ames Rival 115, champion boar; and two junior yearling bred sows priced cheap for immediate sale. F. D. Hall, Perris, Cal.

**We Pay Cash for Hogs of All Sizes**, weights and breeds. Any number from one to several thousand considered. What have you? Durbin and Forbes, 722 San Fernando Building, Broadway 4170, Los Angeles.

**Big Type Durocs**—Well grown out February and March pigs of either sex in any quantity. We ship only the tops and butcher the culls. F. M. Johnson, Napa, Cal.

**Large Yorkshires**—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

**PLW Durocs**—Eastern selections made by R. K. Walker in January. Peters, Lamson & Walker, Devore, San Bernardino County.

**Large Type Poland-Chinas** are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, Cal.

**Rancho Rubio Durocs** all sold out except some choice fall boar pigs. Write for prices. Elmer Lamb, Ceres, Cal.

**Greenwood Farm Durocs**—"Size with Quality." H. C. Witherow, Palo Cedro, Shasta County, Cal.

**Berkshires**—Sired by Star Leader, the \$1,500 boar, ready for service. Kounias Registered Stock Farms, Modesto.

**Durocs**—P. & L's Defender by Defender heads herd. Joseph Prendergast, Route 2 Box 87A, San Bernardino, Cal.

**Registered Durocs of the big type**—Cholera immune. Derryfield Farm, Odd Fellows Building, Sacramento, Cal.

**Carruthers' Farm Berkshire Hogs**—Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

**Poland-Chinas**—A few good breeding boars. S. F. Williams, Orland, Cal.

### MISCELLANEOUS

**Famous Hairy Peruvian Alfalfa Seed**—Highly recommended by U. S. department of agriculture. Only carefully selected seed shipped. Prices and samples gladly furnished on application. E. F. Sanguinetti, Yuma, Arizona.

FARM LANDS FOR SALE

A Prosperous Future is ahead of the alfalfa raiser and now is the time to farm, for alfalfa in the field \$25, promises to reach record prices this year and to enjoy price for a long period. Our district is consistently alfalfa land, the greater part is covered with green irrigated fields, which produce as high as nine crops of hay. I have on hand a number of sections of Madera County, the best part of the San Joaquin Valley, near towns, schools, S. P. and State Highway. Richest silt, loam soil, splendid and unlimited water, finest climate makes profitable raising of many crops and fruits possible. My places are either fully improved, with buildings, pumping plants, growing crops, etc., partly developed, leveled, ready for crop, or high class acreage now in grain, ready for development. I will take as part payment on them, other moderate sized pieces of property, preferably clear, and make terms on balance that will be safe and sure. I deal direct and not as agent and will work in with your requirements if you state them. Arthur Vernon, Fresno, Cal.

For Sale—450 acres of the choicest land in the San Joaquin Valley situated one mile from Lemon Cove on the electric line; plenty of water. This property is without doubt the finest piece of land in the valley and beautifully situated. Will dispose of this property at a sacrifice. Inquire Owner, 224 Byrne Building, Los Angeles.

Big Cut in Price of Farm Land in the best agricultural part of Snohomish County. \$25 to \$35 per acre; 10 yearly payments; railways, mills, factories, plenty of labor. The best proposition on the market for the man who wants a farm. Send for illustrated literature. Brownell Land Co., 904 Third Ave., Seattle, Wash.

For Sale, 5, 10, 20 acres with water. San Fernando. I have 600 acres of the finest land in the San Fernando Valley at vastly reduced prices and on very easy terms. Henry Haack, owner, 224 Byrne Building, Los Angeles.

Arizona—A few sections Arizona school land for sale, approximately four dollars per acre, long time and easy terms. Water conditions good. Particulars, T. C. Davison, Box 101, Ontario, Cal.

\$5.00 Per Acre, 6400 acres, rich silt soil, Cotton, Grain, Alfalfa, Fruit, near R. R. \$1.25 cash, balance long time. Arizona. Send 25c full information. Wells, 1174 Phelan Bldg., San Francisco, Cal.

Oregon, California Government Lands—Booklet Free. Tells "How, Why, Where." Write Joseph Clark, Sacramento.

The California Lima Bean Growers' Association has sold about 310 cars, or 70 per cent of its total crop.

Household Department

END OF A HOOVER DAY

I have come to the end of a meatless day, And peacefully lying in bed, My thoughts revert in a musing way To the food which today I've been fed. When I think of the cheese and the beans and fish And oysters I've had to eat, I've no regrets for the "good old days"— I didn't miss the meat!

I have come to the end of a wheatless day, I have eaten no cookies or pie, I have had no bread that was made with wheat; It was made out of corn or rye; And I liked it so well, that when war is past And a glorious victory won, I'll keep on observing "wheatless" day And eat "corn pone" for fun! —Oconto (Wis.) Enterprise.

TRENCH TRAPS

"Surprises" for Our Boys. The Teutons Leave Them in the Trenches When They "Retire." A Writer in Popular Mechanics Describes Some of Them.

WHAT do you think made that wound?" asked an officer who was conducting me through one of the advance hospitals on the Somme, pointing to the badly swollen and lacerated ankle of a soldier that was just being dressed. The puffy and discolored flesh might have come from a severe sprain, but two or three black punctures on either side indicated that the injury was a more aggravated one.

"If there were a tropical river about," I replied finally, "I should hazard a guess that the man had stepped into the mouth of an alligator, or had been nipped by one while swimming. As I have never heard of alligators in the Somme, I fear I shall have to give it up. What did do it?"

"Trench trap," was the laconic reply; "or, to be more exact, a wolf-trap. Ever since the steady pressure of our advance began to tell—since the Boche began to realize that he would have to continue backing up before our attacks—the Germans have been leaving them behind in the trenches, or laid in inviting little runways through the wire entanglements.

"Not many of our men were caught after the first day or two—we have only had two or three cases here—but several scores of traps have been discovered, along with a lot more of diabolically ingenious contrivances designed to hamper our advance or to give us pause in the matter of occupying abandoned dugouts. In fact, the dodging of the trench-traps has added quite a new interest and zest to our latest attacks."

Scientific "trench trappery" is indeed a new development of modern warfare, and, like so many other things, it has taken the methodical and thorough Teuton to bring out its refinements, to make a fine art of it. Ever since the discovery of gunpowder the practice of mining a position about to be abandoned, the mine to be exploded when the advancing enemy came over it, has been resorted to, and that, indeed, was just about as far as it had gone—even in the present war—up to the time that it became apparent that the French and British pressure on the Somme was likely to go on indefinitely and increasingly.

The wolf-traps were only the first of a series of many devilish little devices left behind by the ousted Germans to deliver a last blow at the victorious Tommy or poilu, a sort of modernization of the famous Parthian shot.

Obviously, "trench trappery" is only practicable in the face of a slowly

and steadily advancing movement— obviously, too, since the proverb that a once-burned child is twice shy applies with equal force to the French and British soldier—it must show a progressive development to stand any chance of success, must be constantly varied, constantly carried on in a new way. That the general scheme has been a flat failure in principle due to the fact that the Germans have not been able to vary their devices sufficiently to baffle their wary quarry.

An abomination of creased steel has evidently been manufactured in considerable quantities for no other purpose than to furnish unpleasant surprises to precipitate Tommies. The latter have nicknamed it the "tortoise," and until they learned that, like its slow-moving animal prototype, it was unsafe to take liberties with, several of them paid the penalty of their curiosity by being injured when it blew up as a consequence of their friendly prods of investigation.

In that its very strangeness of appearance invites attention, the tortoise is like the famous Trojan horse, and the consequences of investigation are, likewise, disastrous. The least touch to the wobbly thing established a contact, doubtless through fulminate of mercury, which detonated 20 or 30 pounds of explosive with a force that shattered the thick steel shell—creased as it was like the casing of a hand-grenade—and scattered the fragments over a wide area.

Something of the direction his latest effort has taken was revealed by a Tommy who was exhibiting to me some of the treasures he had gathered in cleaning up a recently occupied German dugout. One of these, carefully preserved between the leaves of a magazine, was the photograph of what was evidently a German girl, punctured with not less than a dozen bullet-holes.

"Did you take it from a German soldier?" I asked.

"No, sir," was the reply, "only from the wall of a dugout."

"But how did she come to get so shot to pieces?" I asked, adding banteringly: "I have never heard that the British soldier makes war on women."

"But this lady was making war on us, sir," he answered with a smile; "or leastways, one of 'er friends three or four dugouts down the line tried to strafe us, and we had orders to strafe back."

Then he went on to explain that the Tommies had always vied with one another in collecting photographs from the walls of the captured dugouts as souvenirs, a circumstance which the Germans, who appeared to have got wind of it in some way, endeavored to take advantage of by running a wire from the back of some of these mural decorations to mines concealed beneath the floor.

The Tommies had already learned to avoid stepping on the loose ends of boards, and to refrain from rocking tortoises and picking up inconsequential odds and ends from the floor; "but the "mined" photograph was something new, and before the ruse was discovered several "cleaning-up" parties were made to pay rather heavily for the desire of certain of their members to add another Fraulein to their picture-galleries.

Photo-collecting languished for some little time after the "designing" nature of some of these abandoned Gretchens and Hildas had been disclosed, and it is still the custom to give any picture with a suspicious bulge behind it—if there is room to do it in safety—a few propitiatory shots before seeking closer acquaintance.

## The Cultivator Patterns

8653—Children's One Piece Dress. Cut in sizes 2, 4, 6, 8 and 10 years. The lower part of the dress is slightly circular and it is stitched to the yoke. The sleeves may be long or short.

8647—Ladies' One Piece Camisole. Cut in sizes 34, 36, 38, 40 and 42 inches bust measure. The lower part of the camisole is gathered to the band, and the bottom may be gathered to a straight band of the material.

8645—Ladies' Dress. Cut in sizes 36, 38, 40 and 42 inches bust measure. The waist fits the figure closely, and the two-gored skirt is cut wider at the top than at the bottom.

8444—Ladies' One Piece House Dress. Cut in sizes 36, 38, 40 and 42 inches bust measure. This one piece house dress is gathered to the yoke at the front and has a plain back; the dress is belted in at the waistline.

8664—Children's Raglan Coat. Cut in sizes 1, 2, 4, 6 and 8 years. The lower part of the coat is cut quite circular; a small shoulder cape which buttons on the left side is included in the pattern.

8656—Ladies' Two Gored Skirt. Cut in sizes 24, 26, 28, 30 and 32 inches waist measure. The back gore is gathered at the slightly raised waistline, and the front gore is almost straight.

7040—Ladies' Waist. Cut in sizes 34, 36, 38, 40, 42 and 44 inches bust measure. The waist has a kimono foundation, and a sleeveless over-blouse.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.  
HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

## War Bread Recipes

Compiled by the University of Illinois "in the hope that it may be helpful in lessening the use of wheat."

**B**READ is made from flour of wheat or other cereals by the addition of water, salt, and a ferment. Wheat flour is best adapted for bread making, as it contains gluten in the right proportion to make a spongy loaf. Gluten, the protein of the wheat, is a gray, tough elastic substance, insoluble in water. Gluten, being elastic, is expanded by the gas developed in bread dough by fermentation, thereby causing the bread to rise. Flour should always be sifted before measuring.

Yeast is a microscopic plant of fungus growth, and is one of the lowest forms of vegetable life. The yeast plant reproduces by a process known as budding, multiplying very rapidly. Like other plants, favorable conditions for its growth are (1) food, (sugar); (2) warmth, (25 degrees to 35 degrees C. or 70 degrees to 90 degrees F.); (3) moisture. Fermentation, the production of alcohol and carbon dioxide, is the result of the growth of the yeast plant. The yeast plant is killed at a temperature of 100 degrees C. or 212 degrees F. Liquid, dry, or compressed yeast may be used for raising bread. Good bread depends primarily upon good yeast. Fermented bread is made by mixing flour to a dough with water or milk, salt, and a ferment. The dough should be thoroughly kneaded to mix the ingredients and should be allowed to rise in a favorable temperature until it has doubled its bulk. It is then ready to be shaped into loaves. When it has doubled its bulk again, it is ready to be baked.

Bread is baked (1) to kill the ferment, (2) to render the starch digestible by cooking, (3) to drive off alcohol and carbon dioxide, (4) to develop flavor. The loaf should continue rising for the first 15 minutes while baking, and continue browning for the next 20 minutes. The heat may then be reduced and the baking finished in 15 minutes.

Rolls require more heat than bread. They should continue rising for the first five minutes and begin to brown in eight minutes.

### Yeast

Yeast Foam is used in this demonstration. For yeast mixture when Magic Yeast or Yeast Foam is used:

Two cups water, one cake dry yeast, two tablespoons sugar, two tablespoons flour, one-half boiled mashed potatoes, one-quarter teaspoon salt.

Soak yeast in one cup of water. Mix dry ingredients, add potatoes and the other cup of water. Add soaked yeast, beating it thoroughly. Let rise over night. The yeast will be ready for use in the morning.

### Wheat Bread

Three tablespoons lard, two table-

spoons sugar, one cake dry yeast prepared according to directions, one cup lukewarm (scalded) milk, one teaspoon salt.

Mix ingredients, adding yeast mixture last. Beat together thoroughly and add flour, beating with spoon or egg beater. Add flour and knead until a firm, elastic dough is obtained. Let rise until the mass has doubled its bulk. Shape into loaves. Let rise again until the loaves have doubled their bulk. Bake according to preceding directions.

### Parker House Rolls

For Parker House Rolls add an unbeaten egg, two tablespoons sugar and two tablespoons butter at first mixing. Let the mass rise until it has doubled its bulk. Roll out on floured board, mould into shape, and let rise again until slightly increased in bulk. Spread melted butter over half of each bread roll, fold over, pressing the edges together. Place on buttered pan, one inch apart, and let rise. Bake from 12 to 15 minutes in hot oven.

### Salad or Dinner Rolls

Use the same ingredients as for Parker House Rolls, adding four tablespoons of butter to the first mass of dough. Shape as for Parker House Rolls, crescents, bow knots, clover leaf, braids, twists, sticks or other fancy shapes.

### Swedish Rolls

Use the recipe for Salad Rolls, roll to one-fourth inch in thickness, let rise 15 minutes, spread with butter, sprinkle with two tablespoons sugar mixed with one-third teaspoon cinnamon, one-third cup chopped, stoned raisins, and two tablespoons chopped citron; roll like a jelly roll and cut into three-fourths inch pieces. Again let rise. When taken from oven, brush over with white of egg slightly diluted with water; return to oven to perfect the glaze.

### Bread, Using One-third Stale Bread Crumbs

Use proportions as for Wheat Bread recipe given above, working into the batter one cup of stale bread crumbs. The absorbent quality of the crumbs permits the use of less flour than in other dough mixtures.

### Bread, Using One-third Corn Meal

One cup boiling water, one-half cup lukewarm scalded milk, two tablespoons lard, two and one-third cups corn meal, two tablespoons sugar, two tablespoons salt, one cake dry yeast prepared according to directions.

Add the boiling water to the corn meal, cook in a double boiler for a few minutes, and proceed in the manner given in directions for bread.

Three cups of liquid of the recipe requires about seven cups of flour, varying slightly according to the quality of the flour and meal.

## Housewives' Handy List of Substitutes

OUR European Allies will need more food from America during the coming year than in 1917. As the weeks go by America will be called upon

more and more to share her supplies with France, England, Italy and Belgium, whose civilian populations and armies depend for nourishment to a large extent on the food saved in the American household. This surplus can be created only through decreased

consumption of meats, sugar, fats and wheat products and substitution thereof of foods which cannot be shipped so well.

In the rush of preparing meals the housewife finds it difficult sometimes to think of the substitutes needed. Herewith is a small, comprehensive list prepared by the food administration and designed to hang in the kitchen cabinet or on the wall to be used for ready reference.

### MEAT SUBSTITUTES

Poultry, Bean loaf.  
Rabbit, Nut loaf.  
Fish, Bean soup.  
Eggs, Milk soup.  
Cheese dishes, Chowders.  
Baked beans, Milk.

### WHEAT BREAD SUBSTITUTES

Corn bread, Potato biscuit.  
Brown bread, Rye bread  
Oatcakes, Potatoes.  
Buckwheat cakes, Rice.  
Hominy, Graham bread.

### DIRECTIONS FOR FOOD PRESERVATION

Prof. W. V. Cruess of the state university is sending out a list of publications by our state university at Berkeley, and by the department of agriculture at Washington, District of Columbia, which may be had free on application.

Write College of Agriculture, University of California, Berkeley, for any of the following publications: Circular 158, Home and Farm Canning; Circular 108, Grape Juice; Circular 146, Jellies and Marmalades from Citrus Fruits; Leaflet, Salting of Vegetables; Leaflet, Canning Fruits Without Sugar; Leaflet, Fruit Juices; Leaflet, Jelly Stocks; Leaflet, Drying Winter Vegetables; Leaflet, Canning Fruits in Jars or Wax-Top Cans; Leaflet, Canning of Fruit and Vegetables; Leaflet, Preservation of Fresh Eggs; Leaflet, Canning Vegetables in Jars and Wax-Top Cans.

Also write the United States Department of Agriculture, Washington, D. C., for Farmers' Bulletins 841, The Drying of Fruits and Vegetables in the Home; Canning By the One-Day Method, and also 175, 203, 426, 293, 359 and 521.

### MEATLESS MENU

#### BREAKFAST

Rolled Oats  
Omelet  
Corn Muffins  
Coffee

#### LUNCH

Combination Salad  
Sea Food in Rice Border  
Stewed Pears  
Coffee

#### DINNER

Vegetable Soup  
Baked Fillet Sole with Spinach  
Au Gratin Potatoes  
Mixed Green Salad  
Raisin Pudding  
Tea

### FOUR SUGGESTED SCHOOL LUNCHES

(1) One chicken sandwich, one jam sandwich, one apple, one glass of milk, one small piece of cake (two graham or plain crackers and two apples for recesses). (2) Ham sandwich, fudge sandwich, apple sauce, one glass of lemonade. (3) Brown bread and butter sandwich, cottage cheese sandwich, celery, one orange, nut and raisin cookies. (4) Minced ham sandwich, lettuce sandwich, or graham bread and butter sandwich with celery, baked custard, two apples.

### FRIED GREEN PEPPERS.

Fried green peppers make an appetizing accompaniment to steak, chops or cold meat. Take out the seeds, put the peppers in cold water for fifteen minutes, wipe them, sprinkle with salt, dip in flour and fry in hot dripping till soft and slightly browned. Lay them on the dish around the meat and serve with it.

### GOOD ENOUGH FOR HIM

"Are you in favor of abolishing capital punishment?"  
"No, siree! If it was good enough for my forefathers, it's good enough for me."

# This

is the roofing for you to demand!

## Pioneer Roofing

for  
Barns  
Sheds  
Silos  
Garages  
Bungalows

—and every type of building that requires a weather-proof, long-lasting roof.

You can absolutely depend upon Pioneer Roofing. For 30 years it has been the farmers' friend.

**Very Economical**

Being made in this climate for use in this climate by a concern with long experience and large resources—PIONEER ROOFING is the longest lived and most economical roofing on the market. Made in a number of weights and finishes.

## Stretching the Meat

Another Hint for the Game of Making a Little Go a Long Way

**I**T is possible to make a little meat go a long way. Meat pies and meat stews offer a variation for every day in the month. In these combinations a small piece of meat can be stretched to flavor a big dish. Try these hot savory dishes, the whole family will like them.

**Fish Chowder**

Rabbit, fowl, or any meat may be used instead of the fish, or tomatoes instead of milk. Carrots may be omitted.

One and one-half pounds fish (fresh, salt, or canned), nine potatoes peeled and cut in small pieces, one onion, two cups carrots cut in pieces, three cups milk, pepper, three tablespoons flour, one tablespoon fat.

Fry chopped onion in fat for five minutes. Put fat, onions, carrots and potatoes in kettle and cover with boiling water. Cook until vegetables are tender. Mix flour with one-half cup cold milk and stir in liquid in pot to thicken. Add the rest of the milk and the fish which has been removed from the bone and cut in small pieces. Cook until the fish is tender, about ten minutes. Serve hot.

**Tamale Pie**

Two cups cornmeal, two and one-half teaspoons salt, six cups boiling water, one onion, one tablespoon fat, one pound Hamburg steak, two cups

tomatoes, one-half teaspoon cayenne pepper, or one small chopped sweet pepper.

Make a mush by stirring the cornmeal and one and one-half teaspoons salt into boiling water. Cook in a double boiler or over water for 45 minutes. Brown the onion in fat, add the Hamburg steak and stir until the red color disappears. Add the tomato, pepper and one teaspoon salt. Grease a baking-dish, put in a layer of cornmeal mush, add the seasoned meat, and cover with mush. Bake 30 minutes.

**Potted Hominy and Beef**

Five cups cooked hominy, four potatoes, two cups carrots, one teaspoon salt, one-fourth pound dried beef, two cups milk, two tablespoons fat, two tablespoons flour.

Melt the fat, stir in the flour, add the cold milk, and mix well. Cook until it thickens. Cut the potatoes and carrots in dice, mix all the materials in a baking dish, and bake for one hour.

**Shepherd's Pie**

Two cups cooked meat, one cup stock, one tablespoon fat, one tablespoon flour, one-fourth teaspoon salt, pepper, two cups mashed potatoes.

Put diced meat into a baking dish. Add brown sauce made of fat, flour, seasonings and stock. Cover top with mashed potatoes, brush with fat and brown in oven.

## Lighting Systems Are Worth While

Good Lights Mean Health and Happiness

**T**O neglect providing a suitable lighting system for the home is often a great mistake. The man who will not spend money for this purpose will likely have to spend more in correcting his children's eyes. Near-sightedness in school children is a very common defect which increases with age. It is due principally to poor school room lighting and to poor lights in the home. When a child reads by a poor light there is a tendency to hold the book near the eyes, and near-sightedness is the result. Some states are passing laws correcting this defect in school buildings, and the lighting, both from windows and artificial lights, must come up to requirement. When so much money is being spent for all kinds of farm machinery, better livestock, good seed and other improvements, conditions in the home should not be forgotten. Every farmer should put in a good lighting system along with the other modern conveniences for the welfare and happiness of the whole family.

**Selection of Lighting Systems**

A modern lighting system should not be selected on the basis of economy. It costs money to be comfortable and happy, and a thoroughly efficient lighting system will bring many joys into the home. One man who owns a modern lighting system says he would not recommend it to his neighbors because it costs more than kerosene. Another says it takes too much time to keep it operating. Such statements are ridiculous. People might just as well get along without kerosene and live as men of 100 years ago—it would probably be cheaper. The man who claims it takes too much time to operate a modern lighting system does not realize how much

time is spent by his wife in caring for the coaloil lamps.

**Points to Be Remembered**

Get a plant that is rated safe by the National Board of Fire Underwriters.

Get a plant that you thoroughly understand.

Get a plant with capacity for overload.

Get a plant which requires the least amount of time to keep in order.

Get a plant which will not cost too much.

**Lighting Points**

There are a few don'ts which should be kept in mind by everyone interested in proper illumination.

Don't judge illumination by the brightness of lamps. Judge it by the way it helps you to see. A room with dark walls needs more light than rooms with white or light colored walls.

Don't use a flickering light. It will cause eye strain and headache.

Don't use a dazzling or glaring light. The eyes cannot adjust themselves to it.

Don't face the light while reading. The light should come from above and over the left shoulder. Don't have local illumination where general is needed or general where local is needed.

Many of these don'ts can be best remedied by using the proper kind of shades and fixtures and having them properly located.

**LACKED QUALIFICATIONS**

A man recently wrote an agricultural paper saying he had no money or experience, but that he wanted to get on a farm. The editor wrote him to try going through a gate or under a fence.

## BIG SEED COMPANY IS DISTRIBUTING NEW CATALOG

**Aggeler & Musser Seed Company of Los Angeles, Issue 25th Annual Book**

One of the largest seed houses in the West, the Aggeler & Musser Seed Company, Ninth and Alameda streets, Los Angeles, are about to give their handsome 1918 catalog broadcast distribution. It being the 25th annual book issued by the Company, and it is claimed to be one of the most complete and valuable books of its kind ever published by a Western seed house.

Among the many new features are departments on Home Garden Work, School Garden Work, Demonstration Garden Work and Field Garden Work. In reality, this year's edition combines several catalogs in one, for it also includes "Garden Manual," and surpasses all previous editions. It contains answers to more than 1000 questions and gives invaluable information regarding all varieties of plants listed and is fully illustrated.

Not only does it tell all about seeds, but gives full information concerning the correct tools and implements agriculturists should use to obtain the best results. There are also marketing notes on each subject, telling how and where to market. Most useful hints are also given on poultry, spraying, fertilizing and the use of insecticides.

The Aggeler & Musser Seed Company will send this descriptive, illustrated and interesting catalog free and post prepaid to anyone writing requesting it.

Every ball of the YUBA TREAD kept at work at food production helps as much as a hundred balls flung into German trenches.

Apples—In 50-pound boxes, lb.: Fancy 15½; ex. ch., 14½; ch., 14½.  
Pears—Bulk basis, lb.: Fancy, 10½; ex. ch., 9; ch., 8½; standard, 7.  
Raisins—Cases: Sun Maid, seeded, 16-oz. cartons, \$4.20 for 48s and \$3.15 for 36s; fy., \$4.20 for 48s and \$3.15 for 36s; do, 12-oz. 45 to cs. \$5.25; ch. 16-oz. cartons, \$3.00 for 36s; do, 12-oz. cartons, 45 to cs. \$3.10. In bulk: Sun Maid, \$1.75; fy., \$1.90; ch., \$1.75.  
Sulphur-bleached Thompsons, extra fy., \$5.37½; fy., \$5.12½; ch., \$4.87½; soda-bleached, \$4.75.  
Loose: One-crown, \$4.15; 2-crown, \$3.40; 3-crown, \$3.65; 4-crown, \$3.20.

## NUTS

Almonds—Cal. Almond Growers' Exch. Gross prices: Nonpareils, 21½; I. X. L., 19½; Ne Plus, 18½; Drakes, 16; hard shell, 11½.  
Chestnuts, Cal. lb. ....10@20  
Peanuts .....11@12½  
Pecans, lb. ....19@20  
Pine Nuts .....19@20

## HONEY

To the trade, per lb.: Comb, fy. white alfalfa, 20; do sage, 21; light amber, alfalfa, 18; do sage, 19; amber, 15@18.

## BEANS

Jobbers' prices, cwt., recleaned:  
Limas .....12.60@12.75  
Bayous .....8.50@8.75  
Small Whites .....12.00@12.25  
Mexican Reds .....8.50@8.75  
Large Whites .....11.25@11.50  
Pinks .....7.25@7.40  
Blackeyes .....8.00@8.25  
Red Kidney .....18.00  
Cranberry .....11.75@12.00

## HOPS

Per lb.: California crop of 1917, 28@33; on contracts, spot, 1916 crop, 18@22; old, 8@15.

## RICE

California rice, new crop, cleaned, 100 pound head rice, 6.45@6.65; brewers, 5.10; screenings, 5.37½.  
Rough rice, 100 lbs., 3.50@3.60 to growers at shipping points.

## HAY

Under date of January 12, Scott, Magner & Miller says:

Receipts past week, 1432 tons. As has been the case for some time past a large proportion of these arrivals have been for government use. The local market has been very dull during the week with little interest shown.

The food administration has been thoroughly investigating the feed situation. This has brought about definite changes. New business in barley has been entirely suspended, the effect of which has resulted in lowering the price. The price of bran, middlings, shorts and mixed feed have also, through government suggestion, been lowered about \$4.00 per ton. The department is now looking into the hay situation throughout the state. A thorough survey is being made with the idea of ascertaining quantities and conditions in the various districts of the state. The department is also endeavoring to relieve the starving

cattle situation in some of our sections. The dry weather has given the alfalfa market a firm tone.

A small amount of rice straw arrived during the week but practically none of any other variety.

Fancy Wheat Hay (light 5 wire bale) .....29.00@30.00  
No. 1 Wheat or Wheat and Oat Hay .....26.00@28.00  
No. 2 Wheat or Wheat and Oat Hay .....23.00@25.00  
Choice Tame Oat Hay .....27.00@27.50  
Other Tame Oat Hay .....23.00@25.00  
Wild Oat Hay .....23.00@25.00  
Barley Hay .....24.00@25.00  
Alfalfa .....24.00@27.00  
Stock Hay .....20.00@22.00  
No. 1 Barley Straw .....60@90

## GRAIN

Grain Exchange prices, ctl.  
Corn, Cal. Yellow, cwt. ....3.30@3.40  
W. Egyptian, 3.20@3.25; Brown 3.05@3.10  
Barley, Feed & Brewing, cwt. 2.85@2.87½  
Milo .....3.05@3.20  
Oats, Red Seed .....3.00@3.25  
Feed .....2.77½@2.85  
New Black .....3.40@3.60  
Wheat—Government prices: Common white hard, base price is \$3.50 per cental, or \$2.10 per bushel of 60 pounds delivered in terminal warehouses in bulk; soft wheat, base price 2 cents per bushel less, or \$2.08 per bushel; white club (including Sonora), \$2.06 per bushel. If wheat, after cleaning, weighs 60 pounds or more to bushel, base price stands; if 58 to 60 pounds to bushel, 8 cents per bushel reduction; if 56 to 58 pounds, 6 cents per bushel less; if less than 56 pounds, grain becomes sample grade and sells on its merits up to within 1 cent per bushel of 56-lb. wheat. Sacked wheat 4 cents per bushel more, less tare for weight of sacks.

## FEEDSTUFFS

Wholesale prices per ton. Prices fixed by food administration as San Francisco price; Sacramento and Stockton \$1.00 less on carlots at mill door:  
Bran .....34.00@35.00  
Middlings .....41.50@42.50  
Mixed Feed .....37.00@38.00  
Shorts .....35.00@36.00

## SEEDS

Prices in round lots, lb.:  
Millet, recleaned .....4½@5  
Alfalfa .....20@21  
Flax .....6@6½  
Rape .....2½@3

## Citrus Fruit Market

Los Angeles, January 16, 1918.

The market is finding such a limited supply of Navel's that keen bidding is resulting in long prices in all auctions. All markets so far as weather permits pick up instantly every car. Many sales are made around \$4.50 f. o. b. California basis.

No heavy shipments of lemons. Prices firm.

## Shipments

Shipments of citrus fruits from California since November 1, 1917. Southern California oranges, 2500, lemons 605, total 3105; to same date last season, oranges 3749, lemons 930, total 4679. Central California, oranges 1812, lemons 87, total 1899. Same date last season, oranges 3773, lemons 123, total 3901. Northern California oranges 199, to same date last season, 338.

## AT THE AUCTIONS

January 9  
New York: 3 Nav. 1 Lem. Nav. \$4.65-\$5.75. Lem. \$5.15-\$6.15.  
Pittsburg: 1 Lem. \$2.65-\$3.50.

St. Louis: 2 cars. Val. \$3.10-\$3.40.  
Pittsburg: 1 Val. 1 Nav. Val. \$3.65. Nav. \$3.20-\$3.30. Lem. \$4.35-\$6.55.

January 15  
New York: 2 Nav. \$3.20-\$4.60.  
Boston: 5 cars. Nav. \$2.10-\$4.55. Lem. \$3.85-\$5.60.  
Philadelphia: 1 Lem. \$3.10-\$5.85.

## MARKET NOTES

Values on box apples, which were shaded for a time, are being recovered, and when the stock frozen in transit is disposed of it is thought satisfactory prices will return.

Potato prices are trending upward and the new "per cwt." plan is being satisfactorily received by Eastern trade which has always had to do with "per bushel." Southern California truck crops are being visited by aphids as never before, and cabbage and cauliflower in the Fullerton and Compton district are having a most serious problem. The aphid and dry weather combined are creating a bad condition. Central California reports its Brussels sprouts crops as aphid infested.

With Florida's shortage of citrus fruits coming at the same time as California shortage, the golden fruit is easily turned into gold.

New York is the largest single factor in Eastern apple production. Crops this year were exceedingly light, in fact the decrease was 65 per cent, or 4,550,000 barrels, less than the production of 1916. Middle Western states report slight increase, while Washington and Oregon harvested by far their largest production. Expressed in bushels, the United States produced in 1917, 174,608,000, while its 1916 production was 204,000,000 bushels.

To aid in securing cars more quickly, the railways will after January 21, make big advances in demurrage charges. There will be two days free time; thereafter \$3.00, \$4.00, in fact, one dollar per day increase until \$10. per day is reached. This will be serious for citrus shippers who have found profit in holding fruit at times until purchaser could be secured.

The food administration has served notice positively forbidding the rejection of perishable fruits and vegetables unless absolutely unfit for human consumption. "Each person handling foods must conserve to the fullest."

The Eastern blizzard has caused heavy advance in eggs and California poultrymen anticipate a market condition never before offered.

Post card reports to the Los Angeles office of the bureau of markets of the United States department of agriculture show shipments from California during week ending January 14, approximately as follows: Apples, 3 cars; artichokes, 2; cauliflower, 56; celery, 185; cabbage, 25; carrots, 1; dried fruit, mixed, 104; dried figs, 5; lettuce, 45; mixed fruit, 3; mixed vegetables, 67; onions, 21; potatoes, 81; raisins, 102; sweet potatoes, 6.

America's exports in dyestuffs aggregated last year, \$12,500,000. Before the war this country imported \$10,000,000 worth, principally from Germany.

The food administration is publishing posters and sending out publicity material boosting for greater potato consumption. This will have material influence on sustaining prices.

1917 almond crop was the greatest ever for California. It will aggregate at least 3800 tons.

California's output of honey in 1917 was 8,100,000 pounds; nearly all this extracted. This was the state's smallest year since 1913.

Canneries of California put up 8,300,000 cases of fruits in 1917; of vegetables 4,750,000 cases; this does not include tomatoes which aggregated about 2,000,000. 308,000 pounds of butter received from Australia last week.

One car California eggs frozen in transit to New York.

#### TRUCK CROPS

##### Southern California

The celery crop has been affected by the drought and winds in the quality, weight, color, and shipping endurance of the product. Fifty cars are ready for shipment next week, 500 cars being the total not yet shipped.

Field inspection of cabbage has confirmed the last week's report of condition. The supply of marketable cabbage is insufficient to meet the shipping demand.

Cauliflower is running about 25 per cent culls.

Coachella Valley onions are growing well and are about three weeks earlier than last year.

The first shipment of peas from Imperial Valley went out the past week. The early crop is practically a total loss. Vines were not injured but shipments were delayed in starting about two weeks.

Imperial tomatoes were also slightly damaged.

Imperial lettuce was not injured.

Condition of truck crops: Cabbage 78, carrots 89, cauliflower 68, celery 78, tomatoes 82, lettuce 80, onions 88, peas 76, spinach 88, strawberries 88, turnips 83.

##### Central California

The principal crop moving from Central California is celery. About 25 cars per day going out. Frost on the eleventh showed marked effect on stock. Earlier damage has been confined largely to the stem tops, but some stock is reported poorly hearted. About 800 cars still to be shipped.

Condition of truck crops: Artichokes 84, brussel sprouts 55, broccoli 66, cabbage 82, celery 82, peas 83, spinach 88, strawberries 87.

##### Salt River Valley, Arizona

300 acres of lettuce started shipping with the first car Jan. 10. Probable production 125 cars. Condition of crop 90.—E. G. Risser, Assistant Truck Crop Specialist.

#### ACTIVITIES IN CONTRA COSTA

Carl Nichols, farm adviser of Contra Costa County writes that "The farmers are enthusiastic concerning the possibilities for good work with our arm bureau organization, and we are hoping for great things. We have already started a campaign against the round squirrels in cooperation with the United States public health service, and the farm bureau has purchased a ton of poisoned barley and is distributing it at cost to the members of the bureau. We are making plans for a very intensive campaign during the spring and summer months. We will have squirrel days set aside in each farm bureau center when all will get out and poison with poisoned barley or fumigate with carbon bisulphide. We are hoping also to have a squirrel committee appointed in each school district of the county where no arm bureau center is near, and will thus cover every section of the county."

#### RABBIT SKINS AND MEAT ADVANCE IN VALUE

A Chance to Get Rid of the Pests and Make Money at the Same Time

BECAUSE of the increasing market value of rabbit skins, D. A. Gilchrist of the agricultural extension service of Arizona says that in preparing the skins for market they should be removed entire with the exception of the feet and head, and should be dried flat. As five or six dried jack rabbit skins will average a pound, the skins should net approximately five cents each.

In view of the importance of conserving and utilizing all available meat products, it is important this winter that consideration should be given to organizing control campaigns, to practicable plans of killing jack rabbits in such a way that they may be marketed. This may best be accomplished by means of drives and traps, the catch being prepared and shipped to an available market. Local dealers may be found who will handle the animals so that the profits may go to the people participating in the drives, or to cover expenses incident to lunches in connection with such drives.

It may be possible to arouse enthusiasm in such drives by arranging that the receipts shall be turned over to the Red Cross, or the animals shipped to the nearest training camp. In other states county supervisors, farm bureaus and commercial bodies have provided the necessary fencing used in such drives and immense numbers of rabbits have been obtained. Details for conducting such work and all possible assistance will be rendered upon application.

#### COTTON GINNING IN THE UNITED STATES

The cotton that was ginned in the United States from the growth of 1917 prior to December 1 amounted to 9,704,617 running bales, counting round as half bales and excluding linters, compared with 10,352,031 bales in the corresponding period of 1916, and 9,703,612 bales in that of 1915.

These statistics, which are compiled by the United States bureau of the census, include 173,339 round bales for 1917; 177,662 for 1916; and 93,361 for 1915. The number of sea-island bales is 77,638 for 1917; 102,496 for 1916; and 77,165 for 1915. The distribution of sea-island for 1917 by states is: Florida, 33,579; Georgia, 39,883; and South Carolina, 4,176.

The corrected statistics of the quantity of cotton ginned this season prior to November 14 are 8,574,316 bales.

#### SHARPENING FARM TOOLS

The average farmer will save time and labor and will keep his farm tools well sharpened by increasing or bettering his facilities for doing such work.

With a broad flat file an old dull rusty scythe can be sharpened in a few minutes by clamping the blade between two boards and drawing the file back and forth over the blade edge. A whetstone may be used to retain the edge on the blade while the scythe is being used. A large file may also be used in sharpening plowshares, discs, knives, etc.

Two grindstones enable a farmer to do better sharpening than but one stone. The grinding or cutting is then done on the stone having a coarse grit, while the sharp edge is put on the blade or tool by using the finer grit stone.

Where the farm is of considerable size, or a farmer has sweep power or engine power, he can use emery wheels to better advantage for grinding and sharpening tools than can be obtained by using grindstones or files. By belting or gearing the emery wheel shaft—which is journaled in an iron base or frame—to the engine pulley or sweep gear, and having a number of emery wheels of different fineness, a farmer is in a position to sharpen plowshares, discs, scythes and blades in double quick time. The inconvenience and delay occasioned by hauling plowshares and discs to town for the smith to sharpen, is no small item, especially where the discs are needed at once.

In fact, by sharpening the farm tools himself, a farmer can keep them in good, serviceable cutting condition, and the special facilities he has for doing the sharpening will soon pay for themselves.

Almost as important as doing the sharpening is the matter of having duplicate blades. The plow may strike a stone and break a share at a time when it is most needed; a scythe blade may snap in mowing tall weeds, so that it can be used only as a corn-stalk cutter. A new share or blade will be needed sometime, and an extra one on the farm overcomes any delay, or enables two men to work when an extra hand is hired.

Look well to the quality of blades if you wish them to stand much sharp-

ening or withstand breaking under reasonable conditions. Good steel blades are tempered in oil, and of course cost a little more than those not properly tempered or those made from second grade material. You can buy a jackknife for a shilling or for ten shillings, and you know the difference!

Do not sharpen tools with undue haste, especially on an emery wheel, as they may become overheated. Extreme heat withdraws the temper. Before the blade becomes hot from the friction of sharpening, allow it to stand a minute or two, then continue the sharpening. Dipping tool in cold water frequently will prevent burning.—W. A. Rees in Farm Journal.

#### AGREED

Hokus—"Toothache, eh? I'd have the blamed thing pulled if it were mine."

Pokus—"So would I, if it were yours."—Puck.

## GIANT FARM POWDERS

STUMPING — AGRICULTURAL

Here are the subjects of the books that are sent FREE:

**Stumps** 24 pages, 23 illustrations. Explains and shows the most effective methods of blasting. Tells you how to get out stumps of any size cleaner, easier and cheaper by using either of the Giant Farm Powders—Eureka Stumping Powder for dry work and Giant Stumping Powder for wet work.

**Boulders** Shows how to place charges for stone blasting. Gives amount of Giant Powder required to break up stones of various sizes.

**Crops** No deep plowing or cultivation is half so effective as subsoiling with the Giant Farm Powders. If you believe in tillage you believe in subsoiling. Ask for the Giant Subsoiling book, "Better Farm Tillage."

**Trees** Trees in blasted beds develop twice the root systems of trees in unblasted soil. They have the loosened earth and the food needed to do it. In blasted soil, rains and irrigation water sink down many feet and there is no surface run-off. The Giant Tree book, "Better Orchard Tillage," gives complete direc-

tions for orchard soil improvement.

**Ditches** You can blast out clean, deep ditches with Giant Powders. The sides will be sharp and even. The Giant Book, "Better Ditching," tells how to do it.

## These tools do the work of 3 to 6 men

One man can cultivate 3 to 6 times the usual acreage with Planet Jr implements. They are so designed and constructed that with greatest ease they do thorough, rapid cultivation. You save time, labor, money, cut down living expenses, and increase the food supply.

**No. 25 Planet Jr Combined Hill and Drill Seeder, Double and Single Wheel Hoe, Cultivator and Plow** sows all garden seeds from smallest up to peas and beans, in hills or in drills, rolls down and marks next row at one passage, and enables you to cultivate up to two acres a day all through the season. A double and single wheel hoe in one. Straddles crops till 20 inches high, then works between them. Steel frame and 14 inch steel wheels. A splendid combination for the family garden, onion grower, or large gardener.

**No. 17 Planet Jr** is the highest type of single-wheel hoe made. It is a hand-made machine whose light durable construction enables a man, woman, or boy to do the cultivation in a garden in the easiest, quickest and best way. We make 24 styles—various prices.

**S. I. ALLEN & CO**  
Box 1106P  
Philadelphia

**Planet Jr.**

We carry stock in Los Angeles. Agencies in all principal Pacific Coast cities.

## The Man-Saver

**The Martin** Ditcher is a man-saver, and a time-saver—therefore a money-saver. Two men, four horses and a Martin will make or clean more ditch in *one* day than they could plow and shovel out in *three* weeks—time and man saving are big items now.

**Fine for Terracing, Dykes and Roadwork**

Made in 2, 4 and 6 horse sizes; can be used with tractor. Works equally well on side hill or level, or in wet or dry soil. Handles rocks and cuts alfalfa roots without plowing. Cuts or cleans ditches down to 4 feet deep. *All Steel, Reversible and Adjustable. Investigate the Martin NOW.*

## Know Live Stock

Characteristics of every breed—best methods of breeding, training and general care with specific directions on how to buy and sell are given in this best of all LIVE STOCK and COMPLETE STOCK DOCTOR BOOK, a 1400 page Cyclopedic of Live Stock for the Western Rancher and Stock Owner.

This is without doubt the greatest book value on the subject ever offered to readers of this paper. It is the only work of reputable competent authorship covering these important subjects, recommended for general popular use, as a safe guide for the farmer and stock owner, by educated surgeons and by the press. The author, A. H. Baker, M. D. V. S., was the founder and for 27 years Dean and Professor of Theory and Practice of Veterinary Medicine, Chicago Veterinary College.

A great book of 1400 pages.

If you would know all about Horses, Cattle, Swine, Sheep, Goats, and Poultry, their anatomy, with careful and illustrated analysis of the points of Domestic Animals with all the diseases to which they are subject, with remedies for the curable diseases, send for this great book. It explains by methods of object teaching, with written instructions, how to know diseases in domestic animals, the causes, prevention and cure.

Information and instruction are given in plain simple language free from technicalities, but scientifically correct. The remedies prescribed are readily obtained and easily applied.

Over 30 color plates and 1000 object lesson engravings, including one illustrated chart for accurately telling the age of the horse from six months to twenty-nine years old.

The Book, Livestock and Complete Stock Doctor, is published in a single neatly and durably bound volume of 1400 pages 6 1/2 x 9 1/2, weight seven pounds and bound in law sheep. A new copy will be sent complete to any address in the United States upon the following terms:

One subscription to California Cultivator at \$1.00 and \$6.00 in cash.  
Two subscriptions to California Cultivator at \$1.00 each and \$5.00 in cash.

## Advanced Registry for Fine Wooled Sheep

Prof. R. F. Miller of the University of California Makes Address Before the California Sheep and Wool Growers at Davis and Calls Attention to the Need for Advanced Registry for Sheep, Which Would, or at Least Might, Prove of as Great Value to the Wool as it Has to the Dairy Industry.

**F**INE wooled sheep are producers of wool and are the backbone of the entire range industry. To improve the quality of these would be a great step toward improving and increasing the present diminished wool clip. If the rangeman could buy bucks that would assure him of increasing his wool clip, even one-half pound per sheep, he would gladly pay a premium for same.

The purchase of merino sheep is very much at the mercy of the seller. No man can tell when a sheep was shorn or how close it was shorn from the appearance of it. Even at the state fairs and other shows sheep often carry three or four months more wool than they are reported to have on. Stubble shearing and not shearing down on the legs are willful misrepresentations that are anything but a credit to the industry.

There is nothing that has done so much towards improving the dairy cow as the Advanced Registry. When the Registry was first formed the record yield was comparatively low. However, this stimulated production and enthusiastic breeders tried to win a place of honor and raise the production of their herds. Cows that produced a given quantity of milk and butter in a specified time were admitted to the Advanced Registry. Cows that had entered the Advanced Registry became in demand for men began to breed from record cows and looked toward bulls that had sired record cows. In this way the record has been raised from 15 to 20 pounds of butter per week to 45 and even 50 pounds per week.

The same thing can be duplicated with fine wool sheep for the wool clip admits of concrete measurement. It would work wonders in increasing and improving the production of wool. No doubt there have been many high producing rams and ewes among fine wool flocks that have a long list of heavy shearing sons and daughters to their credit, but we have no official record of them, hence their value is lost.

In adopting an Advanced Registry, certain qualifications would have to be decided upon for a standard:

1. Weight of fleece in grease.
  2. Weight of fleece scoured.
  3. Length of fiber.
  4. Weight of sheep.
1. The weight of fleece is perhaps the most important, as this is what the wool grower looks forward to above everything else. The weight of a fleece is commonly expressed in terms of grease wool, but the real weight and value of a fleece is determined on the scoured basis.
2. Weight of fleece scoured. It is not sufficient to have merely a heavy fleece including grease, sand and dirt, but a clean wool of medium or low shrinkage is desirable, so as to yield a large amount of pure fiber. Australian merino wool shrinks about 40

per cent, while American merino wools shrink 60 to 65 per cent. The shrinkage is entire waste. Furthermore, excessively oily fleeces are objectionable as it has been found that sheep secrete oil at the expense of body fat. This lowers the vitality of the sheep and they are less able to resist cold, wet weather or go through a winter of scarce feed.

3. Length of fiber. This is a very desirable characteristic of fine wools in order to spin strong worsted yarns. Fibers must be at least two inches and preferably longer to make a worsted yarn. Length also adds weight to the scoured fleece.

4. Weight of sheep. This is desirable in order to establish uniformity among Advanced Registry entries. A handy weight should be adopted as the standard, and breeders should be encouraged to stay within certain limits for both bucks and ewes.

### Method of Procedure

Whenever a breeder decides to have his flock or the highest producers tested for Advanced Registry, he

should inform the secretary of the California Wool Growers' Association of his wishes. He will in turn advise the animal husbandry division of the State Agricultural College, which will send a supervisor to conduct the test. The supervisor will see that the sheep are close sheared either with the blades or the clippers. Then he will put an official identification mark on the sheep, for which the ear tattoo may prove best. He will then make a record of the date of shearing, denoting blades or clippers, giving age as indicated by the teeth, weight of sheep after shearing, and any natural identification marks. This record is to be made in duplicate and one copy to be forwarded to the Registry Association, while the other is to be put on file at the Agricultural College.

One year later the supervisor returns and each sheep, after being properly identified, is shorn. The shearing must be done with blades if the blades were used at the previous shearing and on the other hand clippers must follow clippers. This pre-

caution must be exercised in order to have like conditions at both shearings.

All tags, dirt, or dung balls must be thrown out.

The fleece is then rolled up and laid on a large cloth and carefully weighed by means of an ordinary pair of milk scales, and a record made of same.

This having been done, the supervisor opens up the fleece and plucks a small lock of wool from the sholder and puts this into a small bottle, carefully labeling the bottle. This sample is sent to the laboratory for determining the length of fiber.

The next step is to sew up the fleece carefully in cheese cloth and prepare it for shipment to the Agricultural College, where it is to be scoured and the shrinkage ascertained.

And lastly, weigh the sheep after it is shorn.

To determine the length of fiber from 100 to 200 individual fibers have to be tested.

To measure the length of a fiber it is mounted on a slide and thrown into a screen by means of a lantern, then traced with a map measure, and the exact length determined.

A number of fleeces have been tested as preliminaries toward working out a standard. The fleeces are all 12 months' growth, the tests being conducted by the writer.

	Pounds of fleece scoured	Pounds of fleece in grease	Shrinkage, Per cent	Length of fiber (inches)

The division of animal husbandry of the University of California is prepared to conduct tests of this kind for any man having fine wool sheep he would like to have tested.

### OUTDOOR EDUCATION

The School Garden Association of America publishes Outdoor Education, a magazine devoted to elementary agriculture, especially for school and home gardens. We are in receipt of the November number which is called the Los Angeles number. It contains items affecting the school and home garden campaign as carried on in Los Angeles and Southern California during 1917.

There is nothing better for growing pigs and hogs of all kinds and ages than skim milk, or milk in any form, sweet or sour. The small farmer with one sow and a few cows with skim milk to spare can make quick money and a substantial side revenue by raising and finishing two litters of pigs each year.

### THE PRAYER FOR RAIN

By John S. McGroarty

Lord, seest Thou not, beside the way,  
The drooping flowers  
That week by week and day by day  
Cry for Thy showers?

Hear'st Thou not the plaintive song  
The wild birds sing,  
That in the withered woodlands throng  
With dusty wing?

The bare brown hills, the blanching plains,  
The silent vale?  
They fade and sicken for Thy rains,  
In sore travail.

The wild folk of the forest keep  
Wail in the night,  
And, 'neath the loam, the poppy sleeps,  
Shut from the light.

Lord, in Thy wideflung, bending sky  
Afar there broods,  
Where veiled and mist-swept oceans lie,  
Thy cloud-pent floods.

Send Thou from thence the singing rain,  
The laughing streams,  
On this dear land of hill and plain  
Thou mad'st of dreams.

This land of dreams Thou mad'st so fair,  
So fair and sweet,  
Set like a jeweled footstool, there  
To rest Thy feet.

The earth will blossom at Thy word—  
O, speak it, then;  
We ask it of Thy mercy, Lord  
In Thy dear name. Amen.

—like snow shoes  
on the snow—

**SIEVE-GRIP** wheels  
give support and traction

## How Can We Improve the Quality of Our Dried Figs?

By Henry Markarian at Fig Institute at Fresno

ANY growers turn their attention to the greatest amount they can possibly produce from their fig orchards, and I want to emphasize that it is equally as profitable to get the best possible product from the orchard. Improvement in quality of dried figs depends entirely upon the grower. If the producer is not taking the proper care to develop his fruit, then curing, processing and other methods will help very little as to the quality, but will only help to give it an attractive appearance.

It has been commonly known that fig trees can be grown with the least care. It is true of course that a fig tree will stand more neglect and abuse than all other fruit trees, excepting the olive, if I am not mistaken. Nevertheless, if fig trees are not given the proper care, the quality, yield and the health of the tree will year by year decline. The reason for the neglect of fig trees was mainly that they were planted as vineyard borders, and whatever income they received from them was velvet. Orchards have been planted so extensively now that this method of border planting has almost ceased.

In order to improve the size and quality and increase the production of figs, the trees must be pruned more or less every year. The tips must be cut back every two or three years so as to give a new growth of laterals. In orchards where splitting and souring of figs are common, the soil must be treated with lime, which has proven a success. The amount of lime depends upon the extent the figs sour, from one to three tons per acre is sufficient. Hydrate of lime is recommended to be used for this purpose, and should not be spread at once, but 1000 to 3000 pounds a year for two years. A heavy application of hydrate of lime may burn the humus in the soil. After the soil is properly limed it must be followed by a soaking irrigation in the spring. This causes the lime water to sink down to the roots of the tree and will give a hard blow to the nematode worms if the roots are infested by this disease.

Irrigation twice a year is very essential for orchards in the San Joaquin Valley. The first soaking should be given about the first part of May when the figs, about the size of a pea or smaller, first appear on the trees. This will help the tree to retain all of the figs produced. The second irrigation should be followed after the capricification season, the season ranging from the twentieth of June to the tenth of July. A good soaking is necessary (the entire ground must be covered with water) in order to give full action to all the roots, which will tend to develop exceedingly large

sized figs and prevent them from falling.

If the trees become mossy, this will run down the quality of the fruit and is a detriment to the tree. The trees should be sprayed once every three years. Prepare a solution of lime and bluestone. The following formula has been used and good results have been obtained; in 50 gallons of water dissolve 30 to 40 pounds of slacked lime, with one pound of bluestone.

During the harvest season care must be taken in handling the fruit. The method I have practiced has been very satisfactory and successful. The figs should be picked from under the trees once a week, at least; if the figs are left too long under the trees the hot sun causes the fruit to discolor. When the figs have been picked they must be carried to the drying yards, spread on trays and left to dry in stacks for ten days. The figs should then be washed in a solution of water, lime and salt. The formula is 40 pounds of salt and eight pounds of live lime to 100 gallons of water. The very dry figs should remain in the bath for an hour, but less time is required for the soft ones. The salt in the solution keeps the figs in a pliable state for packing. The lime acts as a preservative, preventing fermentation and consequent souring. The lime water has a peculiar property of throwing all solid impurities out of the solution and thus enabling the bath to be used a greater number of times.

It is almost always necessary to bleach White Adriatic on account of the dark color after washing. The Smyrna figs need very little sulphur or none at all on account of the lightness in color. One quart of sulphur is required to each sulphur house containing 100 small trays of White Adriatic, and half the amount is necessary for Smyrnas.

The figs should then be spread on trays and transferred to the sulphur house over night to go through a sweating process besides the sulphuring. The figs can be removed in the morning but must be left to dry in the stacks, at least from one to three days, depending upon the condition they are in.

They are now ready for boxing and can be delivered to the packing house. This is my way of curing, and I have met with exceedingly good success. On reaching the packing house they are immediately graded into three different grades such as cooking figs (one or two crowns), choice and fancy's. The cooking figs are used mostly for fig bars and other confections, while the choice and fancy's are packed in fancy packages or layers. The figs again go through a sterilizing process (before they are packed) of hot water or steam when received by the packer.

### More Help

THE farm labor question is concerning nearly every section of the state, and in several sections the feeling prevails that appeal should be made to Washington. The following resolutions were passed by the committee appointed by State Commissioner Hecke as directed at the recent state 'fruit growers' convention:

Whereas, the only way in which a

realization of this object can be attained will be by an assurance on the part of the government authorities that the requisite amount of labor necessary to harvest this greatly increased production will be available; therefore be it

Resolved, that this committee use every endeavor to impress on our state council of defense, upon our state and national government, first,

he urgent necessity of largely increasing the available supply of agricultural laborers; and, second, Of raising the efficiency of all labor by abolishing the saloons for the period of the war. And furthermore, to it

Long Pruning

More long pruning is done in California vineyards than ever before, and every hint which will save a single movement or give more efficient service is of value. We note in the matter of tying vines to the trolley or upright, as the case may be, some Cali-

Fig. 1—Illustrating Bracing of End Post for Vineyard Trellis

ifornia vineyardists use fibre from palms, others raffia, others binder or cheap grade of twine. Here is a suggestion which is given, together with illustrations, from the Standard Cyclo-

Fig. 2—Tying with Wire; the First Movement

York, in which Figure One shows methods of bracing and tying end posts. Of course this trellis is not placed until the second or third year after planting. The book recommends Number Nine galvanized wire, the first to be about 30 inches from the ground, with about 30 inch intervals between wires. Many vineyardists use

Fruit Syrups

**A**N excellent suggestion is made by resolutions offered by Frank T. Swett of Contra Costa at a recent meeting of the farm bureau:

Resolved, That in view of the shortage of sugar due to war conditions the directors of the Contra Costa County farm bureau respectfully request Dean Hunt and the University of California to continue on an adequate scale experiments and demonstrations on the possibility of making grape syrup for use as table syrup and for use in the canning of other fruits.

Also be it resolved that the zymology laboratory under Professors Bi-jetti and Cruess be asked to investigate the possibility of making candy substitutes by the utilization of corn and fruit syrups and fresh or dried fruits.

Resolved, that if it is necessary a delegation be sent to Washington to present the urgent need of a largely increased labor supply for the California farmer.

only two wires. When putting the wire on the posts or tying the vines

Fig. 3—Second Movement

always keep on the windward side. Method of tying the vines is shown

Fig. 4—Third Bend; All Complete but Tying

so plainly in the engravings that further explanation is not necessary.

Fig. 5—Tie Completed

gloves are serviceable when greased or soaked with machine oil. Some men prefer miscible oils for dormant

spraying, as they are more pleasant to handle. Arsenate of lead and Bordeaux sprays in the summer are not so disagreeable.

He Wrote To His Brother "Get a JOHN DEERE Tractor Plow"

"You ask me what I think about your buying a tractor. Judging by my own experience, I'll say that you have done the right thing. But I want to give you some good advice that a neighbor gave me when I decided on tractor farming. 'Remember,' he said, 'that the tractor only pulls. It's the plow that makes the seed-bed.'"

"You ought to get the best plow you can buy to use with your tractor. That's just as important as buying the tractor itself.

"I bought a John Deere plow when I bought my tractor and I am mighty well pleased with the work it does. It is unusually strong and light running. It saves fuel, and fuel costs a good deal these days. It doesn't have any chains and sprockets to cause trouble. It is so easily operated and dependable that I can keep my attention on the tractor while plowing. And best of all, it leaves a perfect job of plowing behind it. The best advice I can give you in connection with your tractor is 'Get a John Deere Plow.'"

And that is the best advice anyone can give to a man who intends to buy, or already owns, a tractor—get a

JOHN DEERE TRACTOR PLOW

Successfully Used With Any Standard Tractor

Makes a Good Tractor Pay

A John Deere Tractor Plow repeats its first great value to you year after year. It continues to make better seed beds. Its use means repeated plow profits for you instead of repeated plow investments by you. Its seed bed-making service makes a good tractor pay.

Operating Economy

A John Deere Tractor Plow in your fields saves time, labor, fuel and plow up-keep. You operate it from the tractor seat. It requires little or no attention as you drive down the field. Its extra-quality bottoms scour perfectly. Its extra clearance prevents clogging. In turning at the end of the field, a slight pull on the trip rope causes the powerful power lift to raise the bottoms high and level.

Because of the location of the axles, the bottoms, when lowered, reach full depth instantly and stay in the ground. Perfect balance and superior bottom qualities make the plow extremely light draft—fuel-saving. There are no chains or sprockets to cause trouble. Every part is as strong as the best of material and workmanship can make it.

Use It With Any Standard Tractor

You can use a John Deere Tractor Plow successfully with any standard tractor. If your tractor is small, get the No. 5, carrying two to three bottoms. If your tractor is of the larger type, get the No. 6, carrying three or four bottoms. Insist on a No. 5 or No. 6—see them at your John Deere dealer's.

Get These Free Books

Write today for our free booklet describing both the No. 5 and No. 6 John Deere Tractor Plows. It has a message on tractor plow value that you will find profitable reading. Ask also for our big free book, "Better Farm Implements and How to Use Them." Its 156 pages describe a full line of labor-saving implements—tells how to adjust and operate many of them. It is full of practical information that will help you. Use it as a reference book. Worth dollars.

To get these books, indicate the farm implements in which you are interested and ask for package TP-2.

## FOOD

That is what we must have to win  
this War. There is no food surplus  
to carry ourselves and our Allies  
through, if there is a crop shortage  
this year. Anything edible that we  
can produce is, therefore, worth far  
more to the World than its mar-  
ket value would indicate. There  
may be plenty of Gold but we can-  
not eat that. Every family should  
raise some Poultry this year and  
plant a War Garden. Our new  
1918 Catalog will help you to get  
ready and is full of useful informa-  
tion. Free.

## Draining the Swamps and Damp Lands

Written for California Cultivator by William M. Bristol

WHILE it is true that the  
county of San Bernardino  
with its 20,000 square miles,  
the largest county in Cali-  
fornia, is chiefly desert, it is  
also true that it contains several  
thousand acres of land so wet that it  
must be artificially drained before it  
can be profitably used.

In the San Bernardino valley—  
which, specifically, means the well-  
nigh mountain-girt basin, about ten  
miles square lying immediately east  
of the Rialto mesa—there are perhaps  
4,000 acres which would be improved  
by drainage.

It is interesting to analyze the condi-  
tions existing in this valley, a fertile  
body of soil overlying a subterranean  
reservoir, characterized by the late  
Dr. Hilgard as one of the most re-  
markable formations in the world. It  
is walled on the north and east by  
the San Bernardino mountains, a vast  
elevated region culminating in Mt.  
San Geronimo, with an altitude of  
nearly 12,000 feet, and having a heavy  
annual rainfall. On the south it is  
hemmed in by a range of lower moun-  
tains which apparently prevent the  
escape of any underground water in

surplus now escapes by way of the  
numerous artesian wells that have  
been drilled, thousands of inches of  
it being led away in canals to River-  
side County.

Unlike the Dakota artesian area,  
where the water is found under a  
stratum of limestone, the San Bernar-  
dino valley owes its artesian condi-  
tions to strata of clay. A portion of  
the water fails to get under the clay  
blankets and consequently flows down  
on top of them. It is this water  
which finds its way to the surface and  
converts large areas into swamps.

All the water flowing down from  
the mountains contains mineral salts  
which it has dissolved out of the rock  
through which it has seeped. When  
this water comes slowly to the surface  
and is evaporated it leaves its min-  
eral salts on or near that surface;  
and, although the salts carried by the  
water are infinitesimal in percentage,  
the continuation of the evaporation  
process for centuries results in such  
an accumulation of mineral salts that  
it is designated as a deposit of alkali  
or an alkali soil.

Alkali soils, so-called, are found  
only in arid regions—regions where

Let Gas Do It  
Machine digging of trench for tiling quicker and more economical.

that direction. Across the western  
end of the basin there is known to be  
an impervious underground dike; and  
thus nature has provided storage ca-  
pacity for more than enough water to  
irrigate the fertile plain overlying it.  
It has been proven in well drilling  
operations that this reservoir, meas-  
uring downward from the surface of  
the soil to bed rock, has a depth of  
more than 1,200 feet. The only out-  
let for the surface waters of the valley  
is via the channel of the Santa Ana  
River, which flows out at the south-  
west corner between Colton and  
Riverside. My own belief, based upon  
observations of portions yet visible  
above the plain, is that the great west  
end dike extends from the mouth of  
Lytle Creek in a southeasterly direc-  
tion to Smiley Heights—in short, that  
the Smiley Heights portion of the  
dike simply was lifted higher than  
the remainder. There are good reasons  
for believing that the channel cut by  
the Santa Ana River through this  
dike, perhaps a few hundred thousand  
years ago and since filled with sand  
and gravel, is the only subterranean  
outlet of any importance from the  
great reservoir.

When it is considered that several  
hundred square miles of mountainous  
territory pour their waters into this  
valley, sinking most of them in the  
gravelly moraines at the mouths of  
the canyons, it is plain that in years  
of normal rainfall there must be a  
surplus in the basin. Much of this

the rainfall is too scant to wash away  
the residue left on the surface by the  
evaporation process. Artificial sub-  
terranean drainage is not only the  
remedy for an excess of water at the  
surface, but is also essential in the  
elimination of alkali from soils where  
water has reached the surface by  
capillarity only. Roughly speaking,  
the districts needing drainage have  
about equal areas of these two classes  
of soil.

It is a time-worn maxim in South-  
ern California that "Water is king."  
Evidently the high value set upon  
water by those who own land at the  
foothills has caused land owners lower  
down to hesitate about letting a thing  
of such value escape from their prem-  
ises. There is a story of a California  
woman whose land was tile-drained  
who caused the drains to be plugged  
every fifth year in order that the peo-  
ple who used the outflow during the  
other four years might not acquire a  
title to it. There is also a story of a  
Yankee lad who declared his inten-  
tion to ride a certain horse even if he  
froze, because it was a borrowed  
horse!

It is dawning upon the people of  
the lower portions of the San Bernar-  
dino valley, however, that too much  
of a good thing is a bad thing. A  
noteworthy beginning in systematic  
tile drainage, installed by the machine  
method, is being made by I. R. Fogler  
on his 65 acre tract on Tippecanoe  
Avenue east of San Bernardino City.

West India Gardens,

F. O. Popenoe, Mgr., Altadena, Calif.

This voracious excavator bites out a trench three to four feet deep at the rate of 200 lineal feet per hour; and one man easily lays the tile behind it. The six inch tile being laid costs six cents per foot; the trench costs two cents per foot, while covering and incidentals cost two cents more, a total of ten cents per foot. As Mr. Fogler is laying his lines 75 feet apart his total expenditure will be about \$50 per acre.

In seasons of scant rainfall Mr. Fogler's land has produced five tons of barley hay per acre. In seasons of normal rainfall it has produced about one-fifth as much. When drained it will yield the maximum every year and will produce other crops in like ratio. The lands which need drainage are, when drained, the richest and most productive in the region. If the man who makes two blades of grass grow where only one grew before is a public benefactor, what shall be said of him who trebles and quadruples the products of his soil in war time?

It is apparent, however, that the systematic, successful and economical drainage of the damp and alkaline lands of the San Bernardino valley can only be accomplished through the organization of a drainage district as provided by state law. A movement in this direction is now well under way and is being pushed by County Farm Adviser H. F. Bahmeier, who has recently returned from Australia where he had four years of experience in drainage work. No engineering difficulties confront the movement, and there is abundant fall throughout the district; but, as is the case in every extensive damp territory, a legally constituted district is necessary to secure rights of way for mains and to construct and maintain them.

## CITRUS EXPOSITION

The management of the National Orange Show are busy people these days, for February 20-28 are exposition dates. Assurance has been given by practically all the leading citrus communities that they are preparing for gorgeous scenes and designs which will make the exposition, as it has always been, a garden of California fruits and flowers. Entertainment features are being provided.

Fungous diseases are much more difficult to control in most cases than insects. One must fight something that he cannot see but feels sure will come later in the shape of diseases. There is little that can be done to destroy or control diseases after they have become visible to the naked eye. These diseases come from minute spores that float through the air in very large numbers and come to rest on the plants. When the proper time and conditions come, these spores grow and enter the tissue of the plant on which they feed. After the disease once enters the tissue of the plant there is no remedy. Nothing can be applied that will kill the disease and not harm the plant. It is the spores, then, that must be killed. With this explanation it is easily seen that the so-called fungicides are really "sporicides," and must be used before the spores grow.

## IT'S ALL IN THE POINT OF VIEW

Albert, aged three and a half, had failed to respond to verbal reprimand, and at last his mother said, "If you don't behave you will have to be spanked. You would not like that, would you?"

"I wouldn't like Daddy to spank me," was the quick response.

"Why not?"

"He doesn't know how. He hurts."

—Life.

## Turnips

Written for California Cultivator by D. F. Reichard

IN REPLY to the many recent inquiries about the planting of turnips we can say that there has been a heavy demand for this vegetable during the winter for shipping to Eastern and Canadian markets where the supply was short. Representatives have been contracting for and shipping large quantities of turnips and carrots. These contracts call for delivery before April first. This would necessitate sowing the turnip seed in our open cool valleys by the middle of November, while in the milder sections, with favorable conditions, as late as January first might be risked.

This is the first time that turnips have really come into prominence with the California growers. Although turnips are grown the year around they do not hold the utility place here that they do in the East and Northeast. Our climate is too mild. They do not store well. Besides it is not necessary to store them for they can be grown at any time except during the warm

summer months in warm valleys, to which the turnip does not take kindly. Conditions Required

Turnips must be grown in rich, loose, well worked soil that is naturally damp or which can be irrigated easily. These conditions are necessary for quick growth which means tender sweet roots. Poorly grown turnips are tough and hot and often bitter.

The variety used almost exclusively now is the Purple Top White Globe. This variety has proved to be the best shipper, and although not quite so quick to mature as the flat varieties, it is more reluctant to get pithy. The Early Purple Top Strap Leaf and Round White Six Weeks turnips are the best obtainable early varieties, very sweet and crisp, but should be used as soon as they attain their growth as they soon get pithy.

Rutabagas are planted to a very limited degree during the fall of the year. Our climate generally is not cold enough for them.

## Castor Beans

Written for California Cultivator

APPARENTLY some shrewd purchaser of castor beans has done some good advertising and started stories as to the value of castor oil as lubricant for airplanes. The number of inquiries which have come to the Cultivator are legion. We are unable to determine as to the source of the stories, and the most definite information to be secured from anyone is what is appearing in the papers. Safe advice has been to all to know as to your market before planting this new crop. Apparently castor beans can be grown to perfection in California. We do not know as to the value of the oil, but we know that years ago the beans were cultivated. One large plantation, at least 160 or more acres, near San Bernardino was planted and harvested. The greatest obstacle seemed to be the cost of harvesting and hulling and the indifferent price received at that time. Under present demand it is to be presumed that much more satisfactory market may be secured, but it is a class of product which should not be grown excepting under contract. There is no oil mill in California.

Oklahoma is the producing center of the industry. Alabama is at present producing large quantities. Presumably this is made possible by the cheap labor in those states. As to the plant and its culture, we quote from the Cyclopaedia of American Agriculture, by L. H. Bailey, published by the Macmillan Company of New York. The particular article quoted from, however, is written by E. Mead Wilcox, who was the first in the United States to undertake the systematic breeding of the plant for the express purpose of increasing its oil producing qualities. This work was started in Oklahoma, and is now continued there by others while Mr. Wilcox is in Alabama.

"The castor oil plant belongs to a family of over 4,000 species and is developed most highly in the tropics. It furnishes a great variety of useful products, among which may be named cassava or tapioca, caoutchouc and shellac. In the tropics the castor bean grows to a tree 30 to 40 feet high, but

in temperate regions it is a large annual.

"The original home of the castor oil plant was in Africa or India, but it is now cultivated in all the warmer parts of the world, either for its oil or as an ornamental plant. The highest yield of oil is secured in the tropics, and it is grown only for ornamental purposes in the northern part of the corn belt where it would be a failure if grown for oil. It is said, however, that the oil secured from beans grown in the temperate climate of the United States is superior for medicinal purposes to that grown in the tropics.

"In the United States the plant is now cultivated commercially in Oklahoma, Illinois, Missouri and Kansas. Oklahoma producing probably over half the total product. The product of the beans in the United States has fallen off very much in recent years and we are becoming more and more dependent on the supply from India. Soil

"The plant prefers a rich well drained sandy or clay loam and will not do well on either a stiff clay or a light sand. In this respect it may be said to do well in soil suited to corn and wheat. If virgin soil is not employed, one must apply either manure or commercial fertilizers to keep up the supply of available nitrogen, potash and phosphoric acid.

### Planting

"The seeds are planted either in rows four or five feet apart each way, or else in rows about four feet apart and only 18 inches apart in the row. When the plants are about six to eight inches high they are thinned to a stand of one plant per hill. It may be found desirable to pour water

## American Mastodon Pansies

SPECIAL OFFER—These four greatest floral novelties FOR 25c, with Booklet, "How to Grow Flowers," and Catalog. OUR BIG CATALOG of Flower and Veg. Seeds, Bulbs, Plants and new fruits FREE. We excel in quality and varieties. JOHN LEWIS CHILDS, Inc., Floral Park, N. Y.

nearly boiling hot, over the seeds and allow them to stand, without heating, for 24 hours. This treatment seems to insure a more uniform and prompt germination. The plants are cultivated level to keep down the weeds, as is corn, until they are about two feet high, from which time they should be able to take care of themselves. From four to six seeds are planted in a hill to allow for all accidents. At the greater distance (four by five feet) about one and one-half quarts of seed are required for an acre; at the lesser distance (four by one and one-half feet) about four quarts are required. Harvesting

"If the beans are planted from the middle of April to the first of May" (this, bear in mind, is presumably for Oklahoma conditions), "one may expect to see the first ripe fruits in July; and from this date to the first frost the pods will continue to ripen and the harvest must be continued. The pods are so constructed as to throw the seeds to a considerable distance when the wall of the pod breaks, and hence the necessity of collecting the entire fruit cluster as soon as it turns dark brown. These clusters are cut off with a sharp instrument and hauled away in a tight wagon-box. They are then spread on a tight floor in the barn and left to dry and crack open. When all the seeds are out of the pods they may be swept together and passed through a hand fanning mill and stored in some dry place until sold. Frosted beans should never be mixed with the good ones as they reduce the value of the whole lot. If gathered at the proper time and handled as indicated, the labor item may be reduced to a minimum.

"One of the points to be kept in mind in the breeding work is to develop a type in which the fruits in any one cluster will ripen at the same time to prevent loss. The work of gathering the crop is tedious and could be much reduced in this way.

#### Manufacture

"The manufacture of castor oil is largely concentrated at present in Jersey City and St. Louis. The former place presses much of the imported material; while the St. Louis mills handle largely the production of the Western states. The hydraulic press is the essential feature of these mills, as the common method is to crush by hydraulic pressure without any further treatment than the mere removal of foreign matter. The seeds are not decorticated, as is the practice with cotton seed in making cottonseed oil. In some cases the seeds are steamed before pressing, but though this permits of more rapid extraction it yields an oil of inferior quality for medicinal and other purposes. Most of the mills leave in the residue ten per cent or more of oil.

"The residue, called castor pomace, is a very good fertilizer material but is poisonous to stock and cannot be employed as cottonseed meal. In some places it is prized as a fertilizer for tobacco and other plants."

Later information from Washington indicates that the demand is not so extreme as at first anticipated. In any case it's an industry calling for special knowledge. If one wants to plant beans, plant beans—but with castor beans let's know "where we're at" first.

It is necessary for the spray materials to come in contact with the spores to kill them. If only half of the leaf surface is covered there will be plenty of spores left unharmed to ruin the entire crop.

#### Book Review

#### SOIL PHYSICS AND MANAGEMENT

"Soil Physics and Management," by J. G. Mosher, professor of soil physics, University of Illinois, and A. F. Gustafson of the same university, published by J. B. Lippincott, Philadelphia.

This is practically a combined text book for agricultural students, a reference book for every farmer's library, and again for general information of everyone interested in growing things in the soil.

"Soil physics is the application of physics to soils. It is so closely related to other sciences that it becomes necessary to trespass upon the ground

of some of them, notably botany, geology, chemistry and zoology, to present certain subjects clearly and completely. Soil physics dovetails in with the closely related phases of agronomy, as soil biology, soil fertility, crop production, and agricultural engineering, to such an extent that it is necessary to give material very closely related to all of these."

There are 442 pages with over 200 half tone engravings and line drawings scattered through the work. There are 28 chapters and a three chapter appendix. Some chapter headings are Soil Material and Its Origin; Weathering; Placing of Soil Material; Soil and Subsoil; Classifications;

Mineral Constituents; Maintaining and Increasing Organic Matter; Physical Properties of Soil; Control of Moisture Through Drainage, Tillage, Dry Land Agriculture, Irrigation, etc.; Alkali Lands and Their Reclamation; Temperature; Aeration; Soil Organisms; Tillage; Erosion; Rotation, etc.

Of the insecticides there are two kinds, the poisons that are used for chewing or biting insects, and the contact sprays that are used to fight sucking insects. The object of the contact sprays for insects is to stop their breathing pores and kill them, while the poison sprays are taken in to the body with the food.

## HERCULES DYNAMITE

### He Read the "Ad"

He was discouraged. An orchard that he had counted on for a good income was panning out badly. And then, one evening, he was reading the paper that you are reading now. The words, "There'll Be A Difference," at the top of an "ad" caught his eye. He read what was said about planting and cultivating orchards with Hercules Dynamite. At the bottom there was an invitation to write for a book, "Progressive Cultivation."

### He Wrote for the Book

It arrived promptly. After he had read it he had a new "slant" on the planting of trees and the cultivation of orchard land.

He gave Hercules Dynamite a trial. (Although he was a little skeptical at first.) Now you couldn't break his faith in Hercules with a crowbar. A fat balance in the bank is the reason why.

Perhaps you have an orchard that hasn't quite come up to scratch. Or perhaps you are about to plant a new one. In either case take a tip from the fellow above.

Write for a free copy of "Progressive Cultivation." You'll read with especial interest what is said about orchards on pages 17 to 21. Write today. The coupon below is convenient.

## Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Supplies for Rabbitry

Where can I get orders filled for supplies for rabbitry?—Subscriber.

Any poultry supply house advertising in the Cultivator should be able to fill orders for medicines, conditioners, or general supplies for rabbitry.

### Hemp

Please give us some information regarding hemp; amount of cold young plants will stand, also temperature mature plants will stand; best method of culture. — Subscriber, Warner Springs.

Hemp is being grown quite extensively in Imperial Valley and we doubt not would grow under conditions existing in San Diego County. As to the degree of cold which it will stand, we have no information. As to cultural requirements, we hope to have some more explicit information. There is more interest in this crop since the introduction of a machine which strips the fibre cheaper than can be done by cheapest hand labor. In the valley it is sown much like the corn crops, the fibre maturing in about 100 days. Time of sowing seed there is during January and February, harvesting May and June. After harvesting the land is used to plant sorghum grains. The average crop is around five tons of dry hemp straw, the price promised around \$17.50.

### Brown Leghorn

Is the Brown Leghorn a good chicken for California conditions? Where may one secure Rose Comb Brown Leghorns?—Subscriber, Chowchilla.

As indicated by the showing in producing yards and at poultry shows, the Brown Leghorn is not a long favorite in this state. There are probably hundreds of the White Leghorns to one of the Brown. From this we judge the White to be the more profitable for commercial work. We are not informed as to breeders of Rose Comb Brown Leghorns.

### Eating Grape Fruit and Drinking Milk at Same Meal

Is there danger in feeding young child grape fruit or permitting it to drink the juice at same meal with oatmeal and milk or meal in which milk is part of the diet?—Subscriber.

This question was referred to M. E. Jaffa, professor of nutrition of the University of California. He writes:

"I regret we have no direct evidence of injurious effects, if any, of the use of grape fruit juice in the diet of a child of five to six years old. Sweet fruits are recommended for young children, and we might suggest several reasons for this. Too much acid may retard the gastric juice. Again, under normal conditions, starch digestion continues in the stomach for a certain length of time, say 30 to 40 minutes, until the gastric juice reaches its maximum acidity, when starch digestion will be inhibited, as far as the starch is concerned. The addition of any large amount of acid to the stomach contents might tend to prevent this action on the starch, which action, of course, is very desirable. If grape fruit juice is eaten just previous to mush and milk, then the action on starch just referred to would prob-

ably be stopped, due to the acidity of the grape fruit. Furthermore, grape fruit juice tends to curdle milk quickly, whereas this curdling would go on much more slowly in the stomach under normal conditions. Therefore we see what might be in some cases an added objection to the use of grape fruit juice with a starch meal where milk is included. The consumption of this juice between meals would be entirely different. In the case of adults, the same conditions would obtain, particularly in the case of those with weak digestion. There are many, however, who have absolutely no trouble whatever with the combination mentioned."

### Walnuts on Pecans

Additional information regarding grafting walnuts on pecans is received from Mr. Horton of Fancher Creek Nurseries. He writes:

"The results from grafting pecans on walnuts would in all probability be unsatisfactory as there is no affinity between the two kinds of wood. While in some instances the scions do grow, the trees seldom ever bear. In most instances where scions do adhere the growth is very poor and of an unsatisfactory nature. Therefore, we would not suggest the advisability of working trees in this way under any conditions."

### Not Gum Disease

A citrus grower at Covina recently submitted material gathered from roots of orange trees, wishing to know as to whether it was indication of gum disease. It was referred to Professor J. T. Barrett of the citrus experiment station at Riverside and he writes:

"The material which you sent in for examination, collected in Covina, appears to be nothing more or less than soil which has been permeated with a gummy exudation from the tree. When soaked in water and examined it has every characteristic of the gum in solution."

### Goat not Breeding

What is the matter with does? They will not breed. The fault is not with the male, for I have bought a new one of entirely different stock. Still no results. Does in good condition, not too fat, plenty of green feed, dry alfalfa, bean straw, and beet tops. No grain for nearly a year. Oldest three years old.—Subscriber, Anaheim.

This query was referred to M. W. Howland who answers: "From the meager data it is difficult to answer this query. Is the buck a tested animal? If you are positive he is then the fault is with the does. Have they kidded before? Some grain should be fed, say a pint each daily. It would seem they are not having a balanced ration on the feed mentioned. I would advise turning the does out to pasture if possible and the fault lies with them, then breed them next fall to a buck you are absolutely sure is fertile."

### White Diarrhea

My little chicks are dying. When opened they show a hard lump of egg yolk and their galls enlarged and black, burst in some cases. Some have bowel trouble; others just get lighter and lighter and die. They are three weeks old, what I have left, 17 out of 51. They have been dying ever since I got them. They were high-priced chicks, cost me 22 cents each, so I would like to save some at least. I have raised chicks for 17 years, and I seldom lose one. They have the best of care.—Subscriber

The symptoms are those of bacillary white diarrhea. One or two chicks in a brood like this might die with diarrhea caused by chill, but when the whole brood goes, unless there is gross carelessness in protecting them from chilling, the fault is almost certain to be in the breeding stock. The fact that you have had many years' experience and no doubt understand the care of chicks, leaves little doubt that there is some bacillary infection among the hens that laid the eggs, but in order to be absolutely sure you would have to send a little of the blood of these hens to the laboratory of Agricultural Experiment Station, Berkeley, for examination. If you or the owner of the hens cared to write Professor Dougherty at Berkeley he will tell you how the test is made. The chances are that by this time all the chicks that are infected are dead, and you will have no difficulty in raising the rest.—J. A. K.

#### Native Grasses

I am sending three native grasses, marked 1, 2 and 3. What are the names of each and their value for stock raising?—Subscriber, Crutts.

We referred these to a botanist who answers:

"No. 1 is Panicum urvilleanum, a well known and useful desert bunch grass; Nos. 2 and 3 have no fruit only the bare stalks, so it is impossible to name them."

In sending specimens of plants for naming, inquirers should always be sure and send not only the stalk and leaf, but flowers or fruits as well.

#### Land Value

Will I be required to pay income tax on land valued at \$4000 given to me by my father?—Subscriber, Cutler.

"The value of property acquired by gift, bequest, devise, or descent is not included in income of individuals or corporations, but the income from such property must be included." Bear in mind "income tax" is not in any sense a tax on land values. The gift, if a bona fide gift, may have been \$4000 or \$4,000,000; it would not be affected by the income tax law.

#### Wages of Partnership

A and B enter into equal partnership and buy a ranch. By contract A agrees to live on the ranch and operate the same, for which the firm pays him a stated salary. In the course of A's residence in the community, occasion arises for him, as a matter of policy, to do several days' work for neighbors, for which is paid the prevailing daily wage. To whom does that wage belong, to A personally or to the joint account? There is no agreement that all of A's time is to be given to the jointly owned ranch and he does not feel that the interests of ranch were lost sight of in the work performed for his neighbors. — Subscriber, Visalia.

As this is more a matter of fact than of law it is not referred to the legal department. However it appeals to us that it is simply a matter of wording of the agreement. It seems to us that the employee's time is entirely that of the partnership, and any remuneration received for work off the ranch would be due to both partners, otherwise there would be no limit excepting the desire of the employee to devote his time to earning extra money. In farming it is hardly thinkable that on a farm of any size there would be much occasion for leaving the farm as opportunities for energy and work on every farm seem unlimited so that it should offer fullest opportunity to both partners.

The Central California Bean Growers' Association now includes nearly 500,000 acres in its membership.

#### AFLAFLA GROWERS GROWING

California Alfalfa Growers' Association Permanently Organized. Most of Officers Southern Californians. It is Hoped Membership May Extend Over State.

Thirty-five alfalfa growers controlling 2500 acres met at Riverside last week and organized the California Alfalfa Growers' Association, with 35 signing the constitution. The directors and officers are: President, Dr. E. H. Wood; first vice president, H. R. Moses; second vice president, G. J. Lyttle; secretary and manager, J. L. Farrar; assistant secretary, H. Green. Directors: Hemet, J. B. Hollingsworth; Ethanac, J. T. Crimmins; Perris, H. R. Moses, G. J. Lyttle; Arlington, Dr. E. H. Wood, J. E. Cook; Wineville, H. Green; Chino, F. S. Kimball; Riverside, J. L. Farrar.

One of the members present asserted that under the most favorable conditions alfalfa cannot be produced for less than \$15 per ton, hence the handling of this product so as to secure fair returns will be the object of the next association. A membership fee of 50 cents is charged with an additional fee of 10 cents per acre.

#### NAPA BUREAU RESOLUTIONS

The situation as to feed for live-stock and poultry is certainly most strenuous, and members of the Napa County farm bureau in its regular session called attention in a series of resolutions to the fact that the live-stock and poultry industries of Napa County have been depleted to an alarming extent and as the nation appeals for greater production of meat and,

"Whereas, corn is selling at from three to four cents per pound, and hogs are bringing 14 to 15 cents per pound, live weight, and the farmer would be engaged in a losing business if he continued to produce meat under the existing conditions, and"

"Whereas, we find that this will result in a very serious depletion of live stock on the farms in Napa County."

"Therefore, be it resolved, that we request the state food commissioner to control the prices of grains and other feeds of live stock so that our

farmers may be able to produce meat on the farms and the threatened shortage of meat be avoided."

These resolutions are signed by Committeemen Bentley, Forbes and Martin, and attested by President Dr. Ben Stetson and Secretary Bertha O. Haines.

Berkshire Congress at Davis University Farm, February 21, 22.

## The "BEAN" for Results

A spraying outfit may have all the other virtues you might possibly think of—but if it doesn't drive the spray material onto the trees at heavy pressure, and if it doesn't keep up uniform work—it's a failure, and your time and money are largely wasted. The BEAN gets results. The sturdy Novo Engine and the Matchless Bean Pump drive the material out at tremendous pressure—so that it reaches every crack and crevice — and does the work thoroughly and completely. You should become familiar with the

### 10 Big Distinctive Features

that give the Bean its prominence. You should know about Bean Porcelain-lined Cylinders, the Bean Pressure Regulator, the Pump without a Stuffing Box, Bean Underneath Suction, the Bean Re-filler, Bean Eccentrics, the Bean Rocking Bolster, Bean Direct-connected Engine and Pump, Bean interchangeable Parts, and

#### Bean Threadless Ball Valves

—the valves that cut sprayer troubles in half. Simply ball metal balls revolving on reversible and interchangeable brass seats. No threads to rust, corrode, or stick tight. Can be opened entirely in less than two minutes without lowering the pressure, without stopping engine, without drawing the liquid from the pump.

## PLANT TREES

Do your "bit" toward insuring a supply of food for the world's millions.

The best varieties of trees are selling out fast.

Shipping Plums, Prunes, Cherries, Pears, Olives, Almonds, Apricots, Peaches—all are equally profitable according to your location. No other investment their equal.

Our foothill trees are free from the root diseases common to other localities. Pedigreed parentage—roots fibrous and well branched—trees hardy and of toughened fibre—features that spell success in tree planting, and in your orcharding.

Submit me a list of your wants for special quotations. Do this now while our assortment is complete. Mail your list right now to Dept. J

Remember! We will take your Liberty Bonds in full or partial payment for trees.

## Economy never means neglect

**I**F your house, barns, cribs, implements and other farm equipment need painting, then painting is imperative. Delay means decay and decay means loss. The Sherwin-Williams Company have been making paints and varnishes for the farm for fifty years. Every farm surface has been studied and a special finish made for it. This "right finish for every surface" gives you a wearing quality that makes the first cost of the paint unimportant.

Do not get just a can of paint—get the specially made Sherwin-Williams finish for the particular surface to be painted. Your dealer will supply you.

## Save Your Crops with Sherwin-Williams Arsenate of Lead AND Dry Lime Sulfur in powdered form

These insecticides are deadly to pests but harmless to growing trees and plants. Being dry powder, they cannot freeze, leak or deteriorate when carried through the winter. In using, just add the powder to water.

It dissolves instantly and stays mixed, spreading easily over the foliage and sticking fast. Ask for Sherwin-Williams Dry Powdered Arsenate of Lead and Lime Sulfur at the store. Spraying booklets sent free on request.

# SHERWIN-WILLIAMS

## PAINTS & VARNISHES

INSECTICIDES, COLORS, WOOD PRESERVATIVES, DYES AND DISINFECTANTS

## Simple Concrete Step Construction

Steps are not only subject to hard usage, but when constructed of wood with the lower part in contact with the ground and subject to alternate wetting and drying, decay is very rapid, making them unsafe and dangerous. Steps at the rear or kitchen entrance of the house encounter especially hard usage, but it is a very easy matter to have them durable and safe by constructing them of concrete. A simple method of doing this is shown in the accompanying drawing. The three forms consist merely of that many boxes open at top and bottom and also at the end adjoining the door-sill.

A rise of eight inches and a tread of ten inches will be found convenient. For this reason the height of each box should be eight inches, since every box will form a step. All of the boxes should be of the same width, but each

ately, being careful that no dirt or other foreign matter falls or collects on the surface of the first batch of concrete, as this would prevent a good bond between the two layers. Finish this step or slab in exactly the same manner as described for the first step. The last or third step is constructed in exactly the same manner as those previously described.

The brace between the two back cleats is for the purpose of preventing the boards from spreading at the side next to the wall. The outer surface of the top step is carefully leveled off with a straight-edge and finished by troweling to a smooth surface. Excessive troweling, however, must be avoided. Not more than a half hour should elapse between placing the concrete for each step so that the concrete first deposited will not harden and set up before the next form is

Concrete Steps  
Simple method of placing planking forms for steps.

one is ten inches shorter than the one beneath it, thus forming the tread of the step. If the steps are few in number and not too wide, one inch boards will be stiff enough to hold the concrete without bulging, but if there is any doubt about this it is better to use two inch plank. The concrete for the steps should be mixed in the proportion of one bag of Portland cement to two and a half cubic feet of clean coarse sand to four cubic feet of crushed rock or pebbles. The earth beneath the steps should be excavated to a depth of six inches below the surface, the excavation being the exact size of the bottom of the steps. Make sure that the earth is level and compact at the bottom of the excavation. Place the largest box in position around the edge of the excavation, staking it in place at two or three points to prevent shifting. Level the first box carefully by means of a carpenter's spirit level. The concrete, mixed rather dry, should be deposited in the box and thoroughly tamped and compacted until moisture rises to the surface. Work or spade the concrete thoroughly along the sides of the forms so as to produce a smooth surface. At the front end of the box, where the concrete becomes the tread, the surface of the concrete is carefully leveled off and smoothed with a trowel for a distance of about 12 inches from the outer edge. Immediately after this is done the second and smaller box is placed on top of the first one, being fastened thereto by a few nails through the upright cleats shown in the drawing. The nails must not be so long as to project through the forms and into the concrete. Fill the second box with concrete immedi-

filled. After the steps are about one week old, the forms may be removed and the steps used. After the forms are removed any roughness or irregularities may be smoothed down and the surface of the entire steps finally finished by rubbing with an old piece of emery wheel and water or carborundum and water. Where the work includes many steps, a hollow space is generally left under the main body of the steps to effect a saving in materials. Where this is done the platform and steps are reinforced with steel rods or heavy wire mesh to prevent cracking.

### ANT POISON

Another formula we have repeated in our columns is that for ant poison, which has proven remarkably effective. There is one serious objection to it in that it is so simple of compounding that many think it will not prove effective. Try it.

Fifteen pounds sugar, seven and one-half pints water, one-fourth ounce tartaric acid. Boil 30 minutes and cool. Three-quarters ounce sodium arsenate. Dissolve in half pint hot water. Cool. Mix together and add one and one-half pounds honey.

Fifteen pounds of sugar looks alarming, but for purposes of this kind grocers will allow purchases larger than for household use.

Cut away all broken, bruised or diseased roots from the trees you are planting, and do it with a sharp knife, making a smooth cut. Cut back the top and little branches to balance the roots.

Riverside County's farm adviser has closed a busy two weeks' series of farm center meetings.

## Another Angle of the Farm Labor Situation

Written for California Cultivator by R. S. Vaile

There is apprehension of a serious farm labor shortage in California during the coming crop season. That this apprehension will have an effect on the total area planted to crops must be evident to anyone familiar with farming sentiment, unless some definite scheme to insure relief is adopted and made public at once. Not the least persistent suggestion for relief is the importation of Chinese laborers in large numbers with military-like organization, and under strong leadership and control. The feature of this suggestion which appeals to the writer is the argument that we permit bands of Chinese, amounting to several thousands in number, to come into our country for the few years of war emergency; that we keep them together in units of moderate size; that we teach them not only our methods of farming, but that we have definitely organized night schools at public expense to

teach them the rudiments of the English language, the ideals of our Western civilization and the broad principles of a Christian democracy. It is easily conceivable that these thousands of Chinese, taken from among the young men of China (possibly from the same range of ages as our draft army), returning to their homes at the close of the emergency, might serve as a stronger leaven in the development of a new era in China than all other outside influences combined.

The writer desires, however, to apply the same arguments to another case. There are certain farming concerns in Southern California that have built up a policy of human helpfulness to the Mexican laborers, merely as a private proposition and largely on commercial grounds. These attempts have been successful in practically eliminating labor troubles, and to the mind of the writer, they stand as a demonstration of the possibilities that

exist for wise, sympathetic state leadership. If 10,000 young Mexicans could be brought into this state as laborers, given good accommodations, taught certain rudiments of fair play, justice and loyalty, and then returned to Mexico, their influence would be incalculable.

### IT PAYS TO FERTILIZE

The University of Illinois has been doing some extensive investigating as to the effect of fertilizers on grain crops. Illinois is a great wheat state, so we refer to one particular experiment conducted on lands which were yielding about eight bushels of wheat per acre. Limited fertilization increased this to about 15 bushels, then 20½, 28, 32, and even on up above 44 bushels per acre. A card is sent to wheat growers, giving all particulars of the experiment in ten different fields, in every one of which there were checked places in which no fertilizer or other soil treatment was given other than crop rotation. Then a plot was treated with farm manure, another with farm manure and limestone, yet another with limestone, manure and phosphate rock, etc.

One field showed in its check plot a production of 11.8 bushels per acre. With farm manure applied it produced 12.2; with manure and limestone, 25.8; manure, limestone and phosphate rock, 32.8; crop residue, lime-

stone, and phosphate rock, 44.2 bushels. This was a larger return than most of the fields, the averages of which were in check plots, no treatment except rotation, 6.7 bushels; farm manure, 10.2; manure and limestone, 22.9; limestone, manure and phosphate rock, 27.4.

These experiment fields are operated by the University of Illinois. The farm manure is applied in proportion to previous crop yields. The crop residues include corn stalks, straw, clover chaff, and cover crops (as sweet clover seeded with small grain and plowed under the next fall or the following spring before planting corn). Yearly acre-rates of applications are 1000 pounds of limestone, 500 of raw rock phosphate, and 200 of kainit; or 4000, 2000, and 800 pounds, respectively, every four years. (The initial application of limestone is usually four tons per acre. After four or five crop rotations, the phosphate application may be reduced to 200 pounds a year).

The average increase of 5.2 bushels of wheat from 500 pounds of rock phosphate on these ten fields may be compared with 4.2 bushels from 200 pounds of bone meal on two of the fields, which are located on southern Illinois soils. An increase of 4.2 bushels was obtained in 60 tests involving duplicate trials which extended over a period of 15 years.

Riverside's banner car of Navels for this season sold in Winnipeg for \$1953.

## Poison for Squirrels

Here it is again!

We have given this formula several times, but in view of the present campaign against ground squirrels in practically every county of the state, it is of much value. This formula for poisoned grain is the one used by the biological survey and other federal departments and county and state organizations which have united in the campaign of squirrel eradication. This formula is taken from sheets being supplied by County Horticultural Commissioner Wood of Los Angeles County:

### Directions for Poisoning California "Digger" or Ground Squirrels

Barley (clean grain), 16 quarts; strychnine (powdered alkaloid), one ounce; bicarbonate of soda (baking soda), one ounce; thin starch paste, three-quarter pint; heavy corn syrup, one-quarter pint; glycerine, one tablespoon; saccharine, one-tenth ounce.

Mix thoroughly one ounce of powdered strychnine (alkaloid) and one ounce of common baking soda. Sift this into three-quarters pint of thin hot starch paste and stir to a creamy mass. This starch paste is made by dissolving one heaping tablespoon of dry gloss starch in a little cold water, which is then added to three-quarters pint of boiling water. Boil and stir constantly until a clear thin paste is formed. Add one-quarter pint of heavy corn syrup and one tablespoon glycerine and stir thoroughly. Add one-tenth ounce of saccharine and stir thoroughly. Pour this mixture over 16 quarts of clean barley and mix well so that the grain is coated.

For mixing small quantities an ordinary galvanized washtub is convenient. For larger quantities a tight, smooth box may be used and the mixing be done with a spade.

Each quart of the poisoned grain is sufficient for 40 or 50 baits. This quantity scattered along squirrel trails or on clean hard places on the surface about the holes will not endanger stock.

**N. B.**—Strychnine in any form other than the powdered strychnine is not effective in the above formula.

**Caution:** All poison containers and all utensils used in the preparation of poisons should be kept plainly labeled

and out of reach of children and irresponsible persons and livestock.

## no limitations of weather

Wet or dry; hot or cold; the Yuba Ball Tread tractor glides over any ground.

The Yuba owner is first in the field in the Spring—and works as late as he desires.

He has no trouble starting the Yuba on a cold morning—it obeys orders like a soldier—instantly.

No matter what job on the farm comes up requiring a power plant—the Yuba is the efficient ma-

chine—sturdy, strong and requiring little repairing—it's the constant-working that commends it to practical farmers.

The YUBA will pull a plow any place a plow should go.

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

**THIS WEEK'S COVER**

State after state has enacted its sheep protection laws in which the dog has been named the culprit, and, unfortunately, some dogs do get out by their "wild, wild lones" and many sheep are found dead the next day. As there are folks and folks, so there are dogs and dogs, and while there are culprit dogs, there are more whose faithfulness has been proverbial. We believe our cover could show no truer friend of man than it shows this week, ready to serve at a minute's notice.

**CHEAPER FEED**

Reports of receipts at the stockyards of the United States in which there is comparison of the two years, 1917 and 1916, show that 1916 made far greater deliveries than 1917. We have report from the bureau of markets for only the first nine months of 1917, but in every one of the larger packing centers during that period the 1916 deliveries far exceeded those of the corresponding nine months of 1917.

Asked why, a hog feeder makes response that at present prices of hogs it is only the shrewdest feeder who can turn this high priced feed into pork and not be ruined in the process. We must produce more pork, and our hog producers and conservationists generally must aid in the problem. The first step is for the farmer to take, and that is to produce more of his own feed. Some are situated so that they can do this.

**GROW BEETS**

Beet growers are planting beets. The committee on its return from Washington gave assurance to the growers that the food administration will guarantee satisfactory prices. The

work of the committee on arriving at Washington was made much more effective by thorough cooperation of all western senators.

There are many details to be worked out between now and harvest time, but the first step to take is to plant beets, and we trust excellent returns will be secured from every one concerned in the industry.

The world is suffering for sugar and our little five pounds per purchase in this country is only a very limited indication of that suffering. Like many other things sugar is not appreciated until it is allowed to prove its worth by its absence. Sugar and fats are now realized to be far more important in the world's energy than was ever realized before.

**YOUR MONEY OR YOUR LIFE**

One of the Camp Kearny soldiers in addressing a bunch of business men suggested that the boys at the camp were prepared to match their lives against the dollars of the business people of the world in the campaign for extending liberty and maintaining the liberties we have. He referred to the spirit which prevails amongst the boys; they are willing to do and to dare anything at the command of the officers, and the intelligence of American boys will prove a factor in making the wonderful fighting army which is being whipped into shape. But he did appeal for the sake of the spirit of those boys and to give them knowledge that there was "a man behind the man behind the gun," that when liberty loan number three is offered, that the American people show their spirit by the manner in which they subscribe for that loan. It is not long before loan number three will be before us. Let us be ready for it. Meanwhile there are thrift savings stamps.

**TRACTOR SCHOOL**

Those who are within reach of the University Farm School at Davis, where practical tractor training under expert direction may be secured, are fortunate. This school will prepare many a man to serve his country in ways other than carrying a musket. Tractor experts are to be transferred from the university farm to Southern California for one week in February. That week will be used to advantage by many who are desirous of getting practical experience so far as they can within the limited time.

The announcement of this short school has brought to the Cultivator inquiry as to where one may have the advantage of expert advice without going to the northern end of the state. There are auto schools which have been conducted for years, which have proven most satisfactory in fitting people for driving and caring for their own machines. People who are far removed from the state university are appealing for these advantages in respect to tractors to come nearer. Sure it is, the university is so far from the boundaries of California that were we in the East we would have to cross several states to reach it.

**STOCKYARDS**

A report from the bureau of markets gives comparison of the first nine months of 1917 with the same period of 1916 as to number of head of stock received at various stockyards of the United States. There are reports from stockyards in nearly 50 states. The larger packing centers, Chicago, Fort Worth, Kansas City, Omaha, and a few others show im-

mense receipts. Some show receipts of millions of cattle; some millions of hogs within the nine months. But there are other points like El Paso, Evansville, Indiana, and even Logansport and Spokane, smaller than several of the cities of California, with their stockyards giving advantages to live stock producers, yet the name of no city in California appears in the long list. Why? Simply because there isn't a stockyard in the state, and the live stock industry which we are all endeavoring to push to its utmost in these times of need languishes instead of growing.

Last week's Imperial Valley papers gave account of cars of stock being shipped to Eastern packing centers. Close observers of market reports a few weeks later will perhaps see chronicled the fact that the bacon, lard and other products from that pork are being shipped back to California. Yet our railways are congested. There is abundant opportunity for efficiency in these United States. This opportunity should be made the most of.

**RING TRUE**

The farmer today is not exactly resting on flowery beds of ease. He has been accused of being a money maker, even of being a grafter and demanding high prices for his produce, which have been paid by the poor people only because they must. Other similar boquets have been tossed to him until he feels like asking to be shown some of the good things he is accused of grabbing.

It is true that there is hardly a farm product but commands today nearly double the price of a few years ago, but we must use horse sense in the consideration of the factors necessary to their production. It is a wise farmer who can look ahead and be sure of getting a profit from any particular crop. Last year beans were planted; wheat was planted; other staples which would aid in feeding the world were planted. Prices were fixed; there was the uncertainty which comes because of other possible price fixing, and now the grower is in anything but a comfortable frame of mind. Price fixing was resorted to a few days ago in the effort to bring stock feeds within reach of the live stock feeder, but after the price was set and the cost of sacks, overhead, and a few other factors computed, it was found that the prices fixed were practically the same as markets had been quoting.

The sugar beet grower did his best in an unfavorable year to produce sugar, and failed to make the cost of his crop; the manufacturers made millions. These latter admit it was a very satisfactory year but call attention to the fact that other years were not so satisfactory. This may be true, but as the situation stands the grower takes all the chances, and that over a period of many months, whereas the manufacturers can cold-bloodedly face only a few weeks' campaign with absolute certainty as to returns. So far the food administration has seemed unable to meet the situation and induce manufacturers to be entirely fair to the producers.

The great point is to win the war. Win or be Belgianized. The awful cruelties of the Prussians have ceased to be "English lies" and have become such realities that America shudders when the bringing of the war near home is suggested.

Hoover said: "If we discontinue food exports to the Allies we will move the German line to the Atlantic seaboard."

So, "Produce more — Save more," must be our slogan.

While a farmer cannot long produce a dollar's worth of pork with feed worth \$1.25 nor sugar with beets grown at a loss, yet he must produce food and help save the world. How? It's for him to decide and, incidentally, it's for the food administration to lend its powerful arm to the task.

It's doing it, but, Folks, we're facing some awful long questions these days. Let's all ring true.

**This Week's War News**

England has two meatless days each week.

Four deserters from Camp Kearny were arrested in Los Angeles on Tuesday.

Line in northern Italy has been pressed back still farther by the troops of the Italians and Allies.

Women of the British labor party of England in convention appealed for league of nations to maintain peace.

The Constituent Assembly met in Petrograd; opponents of the Bolsheviks secured control when the "Bolsheviks left the hall" and the assembly was dissolved.

Conditions in Palestine remain the same, excepting that the English troops have strengthened lines and advanced slightly to more advantageous positions.

Starving Germans in Berlin in riot throw busts of Hindenburg to the ground, and it is reported more than 21,000 deserters from the army have been imprisoned.

The rumor that Vladivostok is in possession of the Japanese continues to bob up, but it is denied by Japan. There are Japanese war vessels in the harbor prepared to protect Allied interests.

Reports from the International Institute of Agriculture indicate that the coming season's crops in Europe will spell famine and starvation for millions and that the greatest responsibility rests on the United States.

On the French and Belgian fronts there have been no actions of importance, though in sector occupied by American troops artillery dueling has been almost continuous with occasional casualties to American boys.

United States government has entered into contract with Holland for the use of a large number of her merchant marine which were lying idle in this country, contract specifying these particular vessels not to be used in the war zone.

"Patriotic criticism" is becoming more general in congress and on the outside ex-President Roosevelt and others have joined in the "contest." There is demand for a shake up in the war department. The president insists Baker will yet make good.

Engagements between British and Turkish cruisers in action in the Dardanelles resulted in the sinking of the Breslau and the beaching of the Goeben, two German war vessels which before the declaration of war by Turkey were "purchased" by her.

Police and federal authorities have raided many I. W. W. headquarters and places where spies congregate and many arrests have been made. Apparently there is a nation wide drive on spies and deserters. The editor of a German paper in South Dakota has been placed under arrest.

Apparently Austria and Hungary are facing a terrible crisis. Riots occur daily in Vienna, and the people are sending up one continual cry for peace. Count Czernin and his entire cabinet have resigned, and it is rumored that Emperor Charles is anxious to make a separate peace.

The coal famine in nearly all Eastern states has been lessened by Garfield's drastic order closing all factories not absolutely necessary for public service or for war purposes for a period of six days and each Monday to come. There is still much suffering and the coldest season in years prevails.

Russian conditions have gone from bad to worse. The Ukrainians of South Russia have set up a separate government with Kiev as capital, have made a separate peace with Austria. The Bolsheviks still control Petrograd, have caused the murder of many opponents, arrested and imprisoned the minister of Roumania, with protest from America and ambassadors of other nations, and a condition of chaos obtains in Petrograd, Moscow and all other sections.

# Agricultural News Notes of the Pacific Coast

## Northern California

Sutter County has over 2000 acres of bearing almonds.

Pear growers are spraying with sulphur to prevent scab.

A farm center has been organized at Thermalito, Butte County.

California Wool Growers will organize a cooperative marketing body.

Raisin growers of Sutter County are signing up the new contracts with the Associated.

The county clerk of Sonoma County recently paid bounty on eight coyote scalps in one day.

Glenn County farmers are appealing for sufficient water to cover 10,000 acres of rice land.

The Sacramento County farm bureau is canvassing the county for selected sorghum grain seed.

Orange growers of Butte County anticipate approximate average per box for Navels shipped around \$2.40.

Humboldt County dairymen recently met at Ferndale and enjoyed a banquet and a good time generally.

The tonnage of Cling peaches of Sutter County has increased from 9000 in 1915 to more than 17,000 last year.

The state and the federal government unite in the building of levees along the Feather River in Butte County.

Purchases of pure bred made at the International Live Stock Show at Chicago for the University Farm at Davis are arriving.

Vacaville Fruit Company at its recent annual elected officers and reported that one concern shipped 242 cars of fruit into 49 markets.

The Tehama County Cattle Growers' Association recently met in annual session. The president for the coming year is Theo. A. Spencer; secretary, D. B. Lyon.

A rice producer of Biggs, Butte County, realizing that every grain should be saved, put a force of men at gleaning after harvest and secured 380 sacks, or \$1200 worth.

Shasta County's new farm bureau held its first meeting at Anderson, December 29. Farm Adviser Talbot is planning a demonstration of preparation of raw land for irrigating.

Sacramento Valley experimenters claim they can grow a bale of cotton and \$100 worth of seed from a plot of land, which proves the Sacramento Valley fitted for cotton production.

The State Wool Growers met in convention at Davis last week. F. A. Ellenwood, for years secretary, was named president, and Prof. R. S. Miller, secretary; C. A. Kimble, vice president.

County Horticultural Commissioner Mills of Butte County has issued warning to fruit growers that stock will not be admitted to that county from sections infested with peach root borer.

The annual meeting of the Humboldt County Dairymen's Association was the occasion of a banquet and review of annual business. The president for the next year is H. F. Harbers; secretary, Robert Flowers.

The Ward Bulb Gardens in Humboldt County are attracting more attention than ever, and it is thought these gardens may aid in the production of bulbs which have heretofore been largely secured from Germany and Holland.

## Central California

One Stanislaus County cherry tree netted \$50.

Owners of cattle brands must register prior to February 1.

The creamery at Modesto is now manufacturing Edam cheese.

Turlock is agitating for the installation of a new storage reservoir.

A large tract of wheat land at Oakdale is to be changed into a dairy ranch.

Tulare County's citrus shipments total about 40 per cent of those of last year.

Irrigationists of the Terra Bella district find the cost per acre-foot to be \$6.80.

Tulare County expects to finish her 220 miles of county paved highway within the year 1918.

Tulare County will hold examination for candidate for horticultural commissioner, February 2.

A Modesto creamery man received the highest scoring at the recent state butter scoring contest.

The lack of rain is causing serious losses to stock men in all portions of the San Joaquin Valley.

Every fig grower of the state is desired to join the new association recently organized at Fresno.

Arizona cotton seed is being brought to Stanislaus County for extensive cotton growing tests.

The Oakdale, Stanislaus County, creamery has paid to its patrons over \$200,000 during the past year.

The recent rainfall was sufficient in some sections of the valley to permit shallow plowing for grain crops.

Stanislaus County's campaign on squirrels is in full force and will continue until the middle of February.

The Modesto Farmers' Union has elected J. H. Hardie, president and Mrs. Chas. T. Whitmore, secretary.

It is now reported that Germany expects immense quantities of wheat and other cereals from southern Russia.

Stock Inspector Griffith of Kings County reports stock of the county in good physical condition with no anthrax.

Bean growers of the San Joaquin Valley are holding a series of meetings and planning a marketing organization.

The sugar shortage has been materially relieved and it is now expected that the allotment will be materially increased.

The castor bean propaganda is now affecting Central California and farm advisers are endeavoring to secure cultural information.

The land settlement board is still discussing purchase of tract of 5000 acres or more, and it is thought an early decision will be made.

R. L. Adams of the University of California has been made farm labor specialist for California in the national campaign for more efficient labor.

"Education, legislation, cooperation" was the slogan of dairymen in attendance at the mass meeting of dairymen of Central California held at Modesto recently.

The Grange Patrons of Husbandry at Aromas recently met in annual session and installed officers for the coming year. The installation was done by Past Master F. H. Blohm.

## Southern California

The Covina citrus district received over \$2,000,000 from last year's citrus crop.

"Pima Cotton" clubs are being organized in the high schools of Imperial.

Hueneme, Ventura County, is planting tomatoes for the coming canning season.

Southern California alfalfa growers are taking the lead in organizing a state marketing association.

Brawley's output of produce for one week aggregated 132 cars; of milo, barley, hay, lettuce, cotton, etc.

The annual meeting of the Tri-Counties Reforestation Committee was held at Orange, January 10.

Walnut growers of Orange County recently made an auto trip through walnut groves of Ventura County.

The Central Lemon Association of Villa Park has elected W. E. Gurton, president, and E. B. Collier, secretary.

The ice plant at Coachella, Riverside County, is being enlarged. It will have a storage capacity of 2000 tons.

Forty employees are busy handling pickled olives and olive oil at the big Lakeland Ranch, Elsinore, Riverside County.

Calexico, Imperial County, is planning a new ice plant, calling for an investment of \$150,000. It will have 50 tons daily capacity.

San Bernardino County produced in 1917, according to annual crop report of County Horticultural Commissioner Coy, \$17,212,862.

San Luis Obispo County live stock men are discussing ways and means for securing feed for 150,000 cattle. Many have already died.

The California Lima Bean Growers' Association has materially increased its membership. Over 80 per cent of its 1917 output has been marketed.

Directors of the San Bernardino County farm bureau have endorsed a movement to establish a branch of the university farm school at Riverside.

The shortage of Navel oranges fits itself to the shortage in cars. The total output will be larger than anticipated because of immense size of most of the fruit.

Even the shells of cull English walnuts are utilized for war purposes after the nuts have been cracked and the meat extracted. They command about \$8.00 per ton.

Special trainloads of Imperial Valley live stock have been sent to Eastern packing houses. The prices are more satisfactory to producers than Coast packers are paying.

Earl L. Morris, formerly of Santa Clara County, has been appointed horticultural commissioner of Orange County in place of Roy K. Bishop who has held the position for eight years.

Specialists of the department of agriculture are endeavoring to determine what becomes of the ladybirds released every year in the Imperial Valley melon fields. The state insectary will unite with the federal specialists in this study.

The contention between sugar beet growers and factory people is still unsettled although Washington has agreed to take a hand in price fixing. The growers are asserting: "The government should forthwith assume control of the sugar refineries as a war measure."

## The Coast and General

Idaho dairy products for 1917 totaled nearly \$8,000,000.

A new cheese factory is to be installed at Gold Beach, Oregon.

Pacific Coast organizers for the third liberty loan are already in action.

California's total fresh deciduous fruit shipments aggregated 24,628 cars.

The output of bituminous coal mines has been increased by about 500 cars daily.

Lane County, Oregon, will increase its acreage of beans from 600 last year to 3300 this year.

One of the most abundant fruit trees along the coast of Hawaiian Islands is the mangrove.

Leo. L. Laythe is the new county agricultural agent for Pima and Pinal Counties in Arizona.

Assessors of Idaho have united on a valuation of \$8.00 per head and \$6.00 per hundred pounds on hogs.

The late December freeze in Florida did not destroy all the truck crops, and limited shipments are now being made.

There will be a session of the International Irrigation Congress held next year; the place not yet announced.

On account of lack of pasture sheep men of Oregon are planting more largely to grain and reducing the number of sheep.

Prune growers of Oregon are endeavoring to have the war department put Oregon prunes on an equal basis with California prunes.

With all rolling stock so far as possible used in transporting coal, a temporary shortage in cereals has been suffered by many of the Eastern states.

Entomologists connected with the department of agriculture at Honolulu are making a special study of fruit flies and parasites which may be introduced.

The United States circuit court of appeals has upheld the reclamation service and protected its appropriation of waters for the Yakima project in Washington.

The Arizona council of defense is endeavoring to save the grazing on state lands of that state for home herds and is asking the stopping of importation of animals for grazing on these lands.

Implement dealers in convention have ruled that hereafter there shall be no more left-handed plows built. There is only a small section of Indiana and Ohio where there is demand for left-handed plows.

The Oregon State Agricultural Society held a most interesting meeting at Salem the early part of December. Among other resolutions passed was one asking the Oregon agricultural college to make a survey of the state with a view to furnishing expert advice as to locations best adapted to various crops and to canning establishments to care for them.

The order of Fuel Administrator Garfield that nearly all factories east of the Mississippi, consuming large quantities of coal, should close for five days and on each Monday for a period of ten weeks is being responded to by nearly all manufacturers in a true patriotic spirit. This order was made to secure the distribution of coal already mined, which distribution was prevented by congestion of traffic.

## MORE WORK FROM YOUR HORSES

Heavy spring work takes the surplus flesh from the horse. His collar no longer fits. His neck and shoulders chafe and gall. He can't do his full share of work and you lose money. Prevent these evils by using TAPATCO Pads.

### A NEW AND BETTER HOOK ATTACHMENT

Consisting of wire staple, reinforced with felt washer (note where arrows point). This gives the hook a better hold and prevents pulling off. The weakest point is made strong and life of pad greatly lengthened.

Found Only on Pads Made by Us.

Look For The Felt Washer.

SOLD BY DEALERS EVERYWHERE

The American Pad & Textile Company

GREENFIELD, OHIO

Canadian Branch: Chatham, Ontario.

Pat. in U. S. Dec. 1, 1914.  
Pat. in Can. Apr. 6, 1915.

## BAG BALM

MADE BY THE KOW-KURE PEOPLE

is a great healing ointment that should find a place in every dairy. It assists the normal, easy milk yield by keeping the udder healthy and free from sores, cuts, chaps, bruises, cracks, bunches and inflammation. Caked Bag responds quickly to the penetrating, healing powers of Bag Balm. Cow Pox, fever spots and any exterior sore are promptly removed. Have Bag Balm on hand to keep little hurts from getting big.

Sold in generous 50c packages by food dealers and druggists. Write for free booklet, "Dairy Wrinkles."

DAIRY ASSOCIATION CO., LYNDONVILLE, VT.

## AYRSHIRES

The Economical Breeds  
when Feed is High

## CHESTERS

A Few Would Give You  
A Good Start

Melone Co. Oak Knoll Napa, Cal.

Lady Beatrice  
Senior and Grand Champion cow  
at the 1917 California State Fair  
and a big winner in the English  
show yards. Record 8538 pounds.

## INNISFAIL MILKING SHORTHORNS

Our herd consists of animals from the leading herds of England and the United States. All milk records from females are official. Average records 8000 pounds and over. Young bulls for sale suitable either for dairy or beef herds.

Alexander & Kellogg

Farm on Grizzly Island SUISUN, CALIFORNIA

## Poland Chinas, Medium Type

Choice breeding stock, both sexes from Panama-Pacific International Exposition prize winning strain; 12 firsts, Junior Champion and Reserve Grand Champion Boar. Junior and Senior and Grand Champion Sows, \$2145 cash awards. Write to

M. Bassett

Hanford, Kings County, Cal.

## Hauser's Digester Tankage

GIVES GREATEST VALUE FOR LEAST MONEY  
IT MAKES THEM FAT.

Hauser Packing Co.

Los Angeles

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

## Who's Who

With the issue of August 11 the Cultivator started its series of "Who's Who" articles to bring before its readers some of the livestock producers of California who are responsible for the large development of the industry. Where did they come from and how long have they been engaged in California development, also how do they look, so pencil and camera are to be used, and some homely, everyday photographs and notes regarding them will bring us closer together. Bear in mind we say "homely photographs" and not photographs of homely people. The idea we wish to convey is that so far as possible we will secure photographs in everyday surroundings at the homes of the livestock producers.

Written for California Cultivator by C. A. Briggs

### FRED D. ROSS

MONG the younger breeders in the state none are more deservedly popular than Fred D. Ross of Hanford.

He is enthusiastic over the merits of his chosen breeds, Holstein cattle and Poland-China hogs, and is throwing all of his energy into their improvement.

Mr. Ross was born in the Keystone State (Pennsylvania) at Beaver Falls. He is 41 years of age. After leaving his native state he lived a number of years in Kansas, but has spent more than half his life in California in Kings County and in Hanford. His opinion of that section of the state, where alfalfa, tall Indian corn and mammoth pumpkins grow, is that no other part of the state can quite equal it as a stock country. And at that he's not far wrong. Previous to his taking up farming and stock breeding Mr. Ross had a business training that helps him in his chosen life work. At the time he gave up what we usually call business to engage in the most important business of all—farming—he was treasurer of the H. G. Lacy Company, who conduct the electric light and power company and operate flouring mills at Hanford.

He has a fine home, a good equipment of farm buildings and 140 acres of the rich land that goes to the making of "The Little Kingdom of Kings." Everybody likes him and everybody calls him "Fred."

Fred D. Ross

## Rice Straw

Regarding rice straw, there is a large opening for livestock people in the Sacramento Valley or any section where it is grown, but as to baling and shipping to far away sections it is probable that it is hardly rich enough in food values to justify. We wrote to Secretary Beard of the Sacramento Valley Development Association and he answers as follows:

"Replying first to the inquiry, I beg to state that it will be practically impossible to get any rice straw delivered at Los Angeles, first, because little of it has been baled; second, because of the difficulty in securing cars. The Dodge Rice Company at Chico has some baled straw. They quote the price \$12.50 per ton f. o. b. (S. P. or N. E. Ry.) Durham Station, but inform me that they think it will be practically impossible to secure any cars.

"At the time I wrote Mr. Nares about the use of rice straw for stock great quantities of straw still remained in the rice fields in stacks as left by the stationary threshers. Much of it has since been burned, and I do not know at this moment how much may still be available for use to those able to reach and secure it.

"Rice straw in the field can be had for a very nominal price. I have been buying it for my ranch near Marysville, paying \$1 per load in the field. In season any quantity of it could be had for this price or even less, and what the stockman should do next year is to get into the field when threshing is in progress, secure their straw and make all proper arrangements for connecting it up with their feed yards, which might involve moving the cattle to the straw.

"Rice straw makes a very good feed where some green feed is available to

go with it. The Dodge Rice Company feed it to their work stock with barley, and Mr. Jacobson, manager, told me a few days ago that some contracting firms in that vicinity are feeding it to work stock with success.

"There was planted to rice in this state last year approximately 81,000 acres, the greater part of it in the Sacramento Valley, and it is safe to say that the average production of straw is at least one ton to the acre.

"The rice growers are not usually stockmen, and as they have not yet developed any profitable market for it they have been burning it in order to get it off the land.

"The existence of this supply of feed, which will no doubt increase rapidly in quantity from year to year, should certainly be taken into account by the livestock growers of the state as it affords a new and, under proper conditions, cheap feed."

### ANGORAS MORE POPULAR

The Arizona Angora men, realizing the importance of the mohair industry to that state, have organized a state goat raisers' association of which T. L. Morris is president. There are in Arizona nearly 300 Angora breeders, and these men own somewhere around one and one-half million goats. It is asserted that the number of Angoras in the state has more than doubled in the past 18 months. With mohair around 65 and 70 cents and Angora mutton more appreciated, it is anticipated that still greater increase will be observed in the industry.

### MOHAIR GROWERS

The National Mohair Growers' Association recently held its annual convention at El Paso, transacted its annual business and elected U. S. Grant, president, and F. O. Landrum, secretary. Phoenix, Arizona was selected as the place of meeting for the 1918 convention to be held at the time of the state fair.

## Farm Curing of Meats

By W. V. Cruess

IN SPITE of the present high price and demand for meats there has been a pressing demand for information on the home and farm curing of pork and beef. To furnish this information the recipes given below have been assembled. They have been tested by the United States department of agriculture and were published by the department. The publication is, however, now out of print and cannot be found in either United States Department of Agriculture or University publications.

### Home Curing of Plain Salt Pork

(a) Prepare a clean hardwood barrel by thoroughly scrubbing the inside with hot water and washing soda or a little lye and rinsing thoroughly with water. Syrup barrels, alcohol or whisky barrels that are still sound and sweet may be used. A large stone-ware crock is also suitable.

(b) The meat must be properly and thoroughly cooled, because if salted before the animal heat is out the shrinkage of the muscles causes the retention of injurious gases giving off an offensive odor to the meat. It must not be frozen because the salt will then not penetrate. Ordinarily 24 to 36 hours cooling after slaughtering will be sufficient.

(c) Cut the carcass in pieces about six inches square. Rub each piece with fine salt and pack closely in a barrel. Let stand overnight.

(d) The next day weigh out ten pounds of salt and two ounces of saltpeter to each 100 pounds of meat and dissolve in four gallons of water. Allow this brine to cool thoroughly.

(e) Cover the pork completely with this cold brine and weigh it down with stones or other heavy weights to keep it completely immersed. The pork should be kept in the brine till used.

### Corned Beef

(a) Cool the carcass thoroughly but do not allow it to freeze. Cut in pieces about five or six inches square. The cheaper cuts such as plate, rump, cross-ribs, brisket, etc., are usually used. Fat beef gives better results than too lean meat.

(b) Weigh and cut meat carefully and allow eight pounds of salt to each 100 pounds of meat. Sprinkle a layer of salt one-fourth inch thick in the bottom of the barrel. Pack in as closely as possible the cuts of meat making a layer five or six inches thick. Then put on a layer of salt, following that with another layer of meat. Repeat until the meat and salt have all been packed into the barrel, care being used to reserve salt enough for a good layer over the top.

(c) After the package has stood over night add for every 100 pounds of meat four pounds of sugar, two ounces of baking soda, and four ounces of saltpeter dissolved in a gallon of tepid water. Three gallons should be enough of cold water to cover this quantity. In case more or less meat is to be corned make the brine in the proportion given.

(d) A loose board weighted down with a heavy stone or other weight should be put on the meat to hold it down under the brine.

(e) In warm weather the brine may become slimy or ropy. If this happens, make a new brine of eight pounds of salt, four pounds of sugar, two ounces of baking soda and four ounces of saltpeter to four gallons of

water. Pour off the old brine and wash the meat thoroughly. Add the new brine. If the meat is kept a long time the brine should be changed occasionally. The meat will usually be corned and ready for use in six weeks.

### 3—Sugar Curing Hams and Bacon for Smoking

(a) Cut bacons in proper sizes and trim hams and shoulders after meat has cooled. Weigh.

(b) Then pack it in a barrel with the hams and shoulders in the bottom, using strips of bacon to fill in between or to put on top.

(c) Weigh out for each 100 pounds of meat eight pounds of salt, two pounds of brown sugar and two ounces of saltpeter. Dissolve all in four gallons of water and cover the meat with the brine. For summer use it will be safer to boil the brine and allow it to cool before using. Place a few pieces of board on the meat with weights to keep the meat immersed in the brine.

(d) Bacon strips should remain in the brine four to six weeks and hams six to eight weeks before smoking. In case the brine becomes slimy or ropy, remove it, wash the meat and cover with a fresh brine made as above.

### 4—Dry Curing of Pork for Smoking

(a) Cut bacons to proper size and trim hams and shoulders. Weigh.

(b) For each 100 pounds of meat weigh out three pounds of salt, two pounds of granulated sugar and two ounces of saltpeter and mix them thoroughly.

(c) Rub the meat once every three days with a third of this mixture. While the meat is curing it is best to have it packed in a tight box or barrel. For sake of convenience it is advisable to have two barrels and to transfer the meat from one to the other each time it is rubbed.

After the last rubbing the meat should lie in the barrel a week or ten days, when it will be cured and ready to smoke.

It cures best in a cool moist place, and the preservatives will not penetrate satisfactorily in a dry warm place.

### Ham and Bacon

(a) Cure the ham in brine or salt as described in recipes three or four. Rinse off adhering salt and allow to drain. Hang in the smoke house.

(b) Smoke continuously for two or three days, or smoke three or four hours each day for about two weeks. Use hardwood or spent tan bark for smoke. (Spent tan bark may be obtained from tanneries. Do not use the fresh tan bark.)

(c) As soon as the meat is sufficiently smoked, open the doors and windows of the smoke house and allow meat to cool. When thoroughly cooled remove and wrap each piece closely in paper. Put the wrapped pieces in strong sacks and tie well at the top. The sacks should be hung where they are to remain until the meat is used. The sacks should be coated with a thick paste of lime, water, and enough glue to make the mixture stick. Do not stack in piles. Hang so pieces do not touch.

### A HOOVER ASSISTANT

Written for California Cultivator  
By C. A. Briggs

A Berkshire sow, Symbaleers' Belle 192393; sired by Symbaleer 5th; dam Tillie Robinhood 4th; bred by N. D. Browning of Jackson, Missouri; and now owned by H. L. and E. H. Murphy of Perkins is making a remarkable production record. She is four years old and a fine individual of the breed. Since coming into her present ownership she has had a litter of 15 pigs in October, 1916, raising 11. In May, 1917, she had a litter of 17 and raised nine. She is now in pig again to Wilsonia King Laurel 240674.

## IN THE FIELD MAKING MONEY—

## or in the Barn Wasting It

WHETHER your horses work or not, their feed costs you big money. When a horse is laid up you not only lose the cost of feed, but also the profit that the horse would have paid it able to work in the field. Since there is no way to prevent spavin, curb, splint, ringbone, sprains and lameness, your thought should be given to their quickest, surest and most economical treatment. For over 40 years, thousands of horsemen have depended on Kendall's Spavin Treatment. It's the old, reliable, safe remedy that has saved thousands of dollars' worth of horse flesh, to say nothing of the worry, time and trouble it has saved horse owners. You should get and keep a bottle of—

## KENDALL'S SPAVIN TREATMENT

Known for 40 Years as Kendall's Spavin Cure

for emergencies. You never can tell when you'll need it, and when the time does come, you'll be mighty glad you had the foresight to prepare. Here are samples of the thousands of letters we receive from grateful horse owners every year. Mr. J. J. Sandlin, New Hope, Ala., writes:—"I am a great believer in Kendall's Spavin Treatment. A few applications have just taken an unnatural growth off my horse's back, thereby increasing his value \$25.00 at least." Mr. J. B. McCullors, Halesville, Ala., writes:—"Last July I bought a mule for \$65.00. He had a bad Spavin and was unable to work, but after using three bottles of your Spavin Treatment it yielded and he was sold in March for \$180. I advise all horse owners to use Kendall's Spavin Treatment." And Mr. Wm. Booth, of Grovett, Ark., writes:—"I have removed both Blood and Bone Spavins, taking the bunch all off and leaving the horse as sound as he ever was."

Why experiment with other remedies—when you know what Kendall's has done and can do. You can get Kendall's Spavin Treatment at any druggist's, \$1.00 per bottle, 6 for \$5.00. Ask for free book, "Treatise on the Horse," or write direct to

## Field Notes from the Live Stock Men

N. H. Locke Company writes: "We recently sold King's Financier, first prize two year old, at California Land Show, shipped to Honolulu; Wild Rose's Valet of L., second prize, Land Show yearling to John Stewart, Napa; Laddies' Letty's Valet of L., first prize Land Show, calf to J. P. Kelly, Marysville.

Gibson's Goods, although he died after only a few years' service in Roselawn herd of registered Shorthorns, has left a marked impress of his great breeding qualities upon the herd. Bought as a calf at what was then a long price by the late T. B. Gibson, this bull developed into a very useful sire. His get have been conspicuous winners in both group and individual classes at California State Fair and at the Portland International, and more of them will yet be heard from.

W. M. Carruthers, San Francisco and Mayfield, has upwards of 150 head of registered Shorthorns in his herd at present. A crop of choice calves is coming on, many of the most promising ones being by the two times grand champion bull, Count Glory. This excellent sire is being given heavy service in the herd at present, and from some of the young things noted around the paddocks and in the

pastures at Carruthers Farms, the get of this sire will need to be reckoned with in the young group classes at the 1918 Western fairs. A part of Carruthers Farms was recently taken over by the government, the land being needed for operations at Camp Fremont.

H. M. Elberg, manager of Roselawn Stock Farm, Woodland, recently returned from the Middle West, bringing back a few head of especially good registered Shorthorns to add to the Roselawn herd. For a junior herd sire the yearling Crescent Dale was selected. He is a red of pleasing form, well covered, and with unusually good rear quarters. He is of distinguished breeding, being by Whitehall Rose Dale, by Avondale, and out of Cressie Belle. A prospect for a future herd sire was secured when Mr. Elberg purchased the good Scotch cow, Mischief E 3d, a daughter of Village Bridegroom, with a bull calf at foot. This youngster is a pure white by Eastlawn Champion, he by Champion of Scotland. He is a most promising calf and on pedigree and present promise should develop into a herd sire fully worthy a place at the head of the good Roselawn herd. Mr. Elberg was accompanied on the buying trip by the capable Roselawn herdsman, Carl Johnson.

## Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

### Stomatitis

Our cat has sores on her chin and by her whiskers. At first there were black specks on the chin and at the roots of the whiskers, but now they have broken out into sores. Have dressed it with peroxide but it is not improving. Please advise us what to do.—Subscriber, Eubanks.

Probably the main trouble is in the stomach. Give ten grains of phosphate of soda dissolved in a tablespoon of water every morning for a week. Also swab out the inside of the mouth and on the sores outside with a solution of alum and borax; half a dram of each in four ounces of water.

### Swelling on Jaw

Have a two year old mare that has a large flat swelling on the right jaw bone. The swelling is quite noticeable and has not changed much since we first saw it about two months ago. It is not sore and the mare began running at the nose about a week after we noticed the swelling. What would you advise doing with it?—Subscriber, Nestor.

The swelling may be due to an ulcerated tooth or it may be due to barley beads or foxtail working through the membranes lining the mouth. The discharge from the nose may be caused by the irritation from the jaw and will disappear when the jaw is cured. Better have a veterinarian examine her.

### Snuffles

Since my mare has recovered from the strangles she has begun to snuffle and is short of breath. Have smoked her with pine tar and have used turpentine and hot water but so far she does not improve. What would you advise?—Subscriber, Nestor.

The snuffling or difficult breathing is probably due to paralysis of the vocal cords as is sometimes seen following a case of strangles. The trouble is called roaring and is hard to cure. Only an operation on the throat seems to be successful and that can only be

done by a well qualified veterinarian. Sometimes when they are fed very scantily for a time and then have a run at grass they make a very good recovery. You might try that first.

### Fistulous Withers

I have a horse that has a swelling just at the top of the shoulder blade and over the withers. It seems to be puffy on both sides of the withers, the left side being the largest. We first saw it about a month ago. We have been rubbing it every day. It does not grow any larger. Can it be rubbed away?—Subscriber, Artesia.

It is nothing more nor less than an abscess caused by a bruise. The parts may be bruised when the horse is rolling if he rolls on a stone or any hard substance, or in passing under a low beam in the stable or the limb of a tree. There are many ways that the withers may be bruised. It is hard to cure because the parts are mostly bone with very little flesh between. Also very little blood goes to those parts and the abscess being on the top it does not drain well. It is full of pus which will not absorb. It will have to be opened and all the pus and bruised tissue removed then thoroughly cleansed out to the very bottom, once a day until filled with healthy tissue. You will have to get a veterinarian to open it for you and then he can give you the medicine and instructions how to care for it.

### Bitter Milk

I have a Jersey cow about ten years old. Two weeks ago her milk began tasting badly after standing from ten to 12 hours and next day the cream had a bad odor and tasted badly. Butter made from this cream also tasted and smelled badly. Last year about this time we had the same trouble with her milk and dried her up. She was dry about five months. She is giving over two gallons of milk a day and would like to keep her milking if the trouble can be remedied. She is fed alfalfa hay that is mixed with Bermuda grass and has plenty of clean water. What is the remedy?—Subscriber, Hynes.

The conditions you describe are not common but those who treat diseases of animals see a few such cases ev-

ery year, about this time. It is thought to be due to a germ that gets into the system through the drinking water or possibly through the feed. It does not seem to affect the general health of cows very much but shows up in the milk as you have observed. Look well to the source from which the drinking water comes and if there is any possible way for any drainage to get into it see that the conditions are changed. Give the cow two drams of the bisulphite of soda once a day for ten days. Also give her one dose of salts. One pound epsom salts, half a pound of common salt and a large tablespoon of ginger. Dissolve all in a quart of hot water and when cool give at one dose. Green feed is hard to get at this time but anything fresh and green in place of the hay will also help.

**Hog Cholera**  
Have been having some trouble with our hogs. Have lost five and have several more sick. Am at a loss to know just how to handle it. We have them in a warm dry place and have good feed for them. The sick ones are in a hospital pen and get a mixture of soaked corn, barley, middlings, tankage, condition powders, etc. We had some trouble several weeks ago and thinking it was cholera vaccinated them and several of the sick ones got well. Our veterinarian said he thought the improvement was due to the protein in the injection rather than to the serum itself. Have held post mortem on those that died and found some well marked cases of and discolorations of cholera so it pneumonia while others had lesions seems to be a conglomeration of troubles. Please give us your opinion on the subject.—Subscriber, Southern California.

From your description we would judge it to be hog cholera. It does not affect all alike. Some have pneumonia while all have more or less trouble with the digestive organs and the spleen of a cholera sick hog is said to be always enlarged. It is rather late now to expect the regular hog cholera serum to save the bunch. It is more of a preventive than a cure. Some claim now to have discovered a remedy that cures a large percentage of the sick ones and does it quickly. We hope this is true and we will have to try their remedies until the right one is found. There was a time when veterinarians dreaded to be called to treat a case of milk fever in cows knowing that a large per cent of them would die in spite of all he could do but now it is like play to treat a case of milk fever because we know we can save every one. The hog raisers will just have to keep on employing the veterinarians to treat their sick hogs hoping they have or soon will find a remedy that will cure quickly. The only hogs the veterinarian has to experiment on belong to the other fellow and he must have some pay for his time for he can not live on air and sunshine alone. This may be poor consolation for the present but in time he will pay back with interest compounded many times for all he is getting now. At the present prices of pork it would seem that the farmer could afford to spend a little to help the good work along.

In addition to high food value silage supplies succulence which makes it easily digestible. This tends to provide June conditions in the dairy in January and results in a full milk flow.

Be careful with your sires. Select them with the utmost care. From chickens to horses observe the same rule and observe it strictly.

Whether or not a man can make his dairy pay depends wholly upon the attention he pays to the cows.

# Cleveland Tractor

## Does the work of 9 horses and 3 men

Even if horses and men were plentiful, the Cleveland Tractor would do your work faster and at much less cost.

With the Cleveland pulling two 14-inch bottoms, it can plow up to 3½ miles an hour—8 to 10 acres a day. That is more than you can do with three good three-horse teams and their drivers.

But labor is scarce. Horses are scarce. The urgency of the situation demands farm tractors. The Government urges their use.

The Cleveland Tractor not only works faster and cheaper than horses and men — but far better. With its aid, you can increase production and reduce the cost.

That means more grain for Uncle Sam—more money for you.

Because the Cleveland crawls on its own tracks, it can go almost anywhere. It weighs less than 3200 pounds and has more than 600 square inches of continuous traction surface—a bearing pressure of about five pounds per square inch.

Because of the small size of the Cleveland Tractor it can be turned in a twelve-foot circle and housed in less space than it takes for a horse.

Its small size enables it to pass through narrow spaces between buildings, through wooded grounds, through doors and other places where larger machines cannot go.

The work in which The Cleveland Tractor can be used to accomplish more, and with greater

economy, is almost endless—plowing, harrowing, discing, seeding, pulling a mower or binder, hay loader or manure spreader.

It is the tractor par-excellence for hauling of any nature, in excavating, road grading, pulling a snow-plow or stone-boat, in fact almost anywhere that motive power can be utilized.

Delivering 20 horse-power at the pulley, it supplements its hauling capacity by almost innumerable uses for stationary work, such as wood sawing, pumping and irrigation work, feed grinding, hay baling, corn shredding, corn shelling, ensilage cutting, silo filling, threshing, and many other uses where power is needed.

Rollin H. White, the famous motor truck engineer, is the designer of the Cleveland. He uses only the finest motor truck gears and materials. Gears are enclosed in dirt-proof, dust-proof cases.

Get ready now for spring work. Prepare for the bigger, better crops America expects of you and must have. Write us today for a complete description of the Cleveland Tractor and the name of the nearest Cleveland dealer.

## THE SELF-OILING WINDMILL

has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making their self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash-Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws. Write AERMOTOR CO., 2500 Twelfth St., Chicago. SMITH-BOOTH-USHER CO. Southern California Distributors for AUTO-OILED AERMOTOR Los Angeles

## The Coming Western Berkshire Congress

By F. R. Steel, President Western Berkshire Congress

When the first Western Berkshire Congress was held at the Panama-Pacific Exposition in 1915 consignments were made to the sale that was a chief feature of the event with many misgivings by the consignors. The success of that first Western Berkshire Congress sale is now a matter of history; and the happy result of the second sale at Sacramento and of the third at Davis is also well known. The reason for this continued success appears in the strict protection of the interests of the buyers at these sales. The management insists that only bred sows or bred gilts (the thing for which there is the greatest demand and which has proven the most satisfactory in public sales of swine) shall be consigned. It also allows nothing but really superior animals to be sold. A secret committee passes upon each sow or gilt before she is permitted to go through the sales ring, thus insuring the buyer that only worth while and valuable breeding foundation material will be sold at Western Berkshire Congress sales. Then again each sow and gilt has to be guaranteed safe in pig at the time of sale by the consignor; and this year practically all animals sold will also be far enough along in pig so that they will plainly show their own guarantee.

An innovation this year will be the publishing in the catalog of the weight of each animal consigned; and also the official weighing at Davis of each sow after her arrival there, which weight will be announced at the sale ring. This, together with the pedigree published in the catalog and the show record, if any, of the animal and

her immediate ancestors, will give buyers who can not attend the sale in person, but who wish to send in bids nevertheless, by far the best chance that has ever been given at any public sale to intelligently and profitably select bred sows or bred gilts to add to their herds or with which to start new herds. This matter of so arranging the coming Western Berkshire Congress sale at Davis February 21st and 22nd that a good many animals can be profitably bought by people not themselves present at the sale is being given special and careful attention by the management.

The questions of the year most important to Berkshire breeders of the West will be thoroughly discussed and action decided upon. Chief among the paramount questions to be decided at this time will be the way in which Berkshire breeders of the West and the Western Berkshire Congress as an organization can be of most substantial use to our government in winning the war. The matter of an Advanced Registry for Berkshires will be brought to a head, and definite recommendations concerning this important move formed. The general advertising campaign for Berkshires will be thoroughly discussed and the opinion of the West brought to bear upon the movement. The campaign recently started by the American Berkshire Association through the various state vice presidents of that association for the definite advancement of Berkshire interests in each state will be outlined and explained.

Come to Davis on February 21 and 22.

## The Dairyman's War Obligation and Opportunity

**O**F COURSE it is the regular stunt to urge greater production—and none the less our duty even if it is being peached into us from all sides. The department of agriculture is chief in pushing for this increased production, and California's response has been most gratifying. Here is a general statement issued by the assistant secretary which covers much of the same ground heretofore touched, but at the same time it is a statement of sufficient value to be given entire.

We believe dairymen are doing their best to make response, but if any dairyman in the world ever was confronted with one big problem it is the California dairyman at the beginning of 1918. The statement follows: All individuals and all industries have war problems to solve and war duties to perform. Perplexities that were unknown in the past are faced today by every person and every business—and opportunities for patriotic service are found that were never known before.

The dairy industry is not an exception. Its problems are difficult but its privilege is great, for by solving its problems it will do much to help win the war.

In order to measure up to the food requirements of the war we must bring about all possible increases of every staple food that we produce and conserve to the utmost these foodstuffs

after they are produced. Milk and dairy products are fundamental food requirements. We can not reduce consumption without inviting serious impairment of health and lowering of vitality. The war has greatly increased the foreign demand for our dairy products. In order to be able to meet these demands and at the same time maintain the domestic supply, the dairy cattle of our country must be conserved now and breeding programs so conducted that herd increases will be assured for the future.

The dairyman's war obligations are to maintain and increase herds, to utilize more effectively milk by-products that have been wasted or only partly used as human food, and to apply to the industry, if possible, improvements in methods of feeding and management whereby production may be economically increased.

One of the most important points to be remembered is that if a dairyman decides he must sell some of his profitable cattle he should make every effort to sell them to another dairyman who is so situated that his herd is not to be reduced, or to sell them to a farmer who can carry a few more milk cows. It is deplorable for a dairy cow of good qualities to be slaughtered at a time when the maintenance of the dairy industry will help win the war and will assist humanity in meeting its food problems after the war.

BEN A. RHOADES, Auctioneer  
1501-3-5 So. Main St., Los Angeles, Cal.

have been slaughtered for meat during the last three years. The continental dairy countries imported much of their feed before the war. The war brought about a reduction of such shipments. There wasn't enough ocean tonnage to be spared for hay and concentrates because guns and powder and human food were the urgent military needs. At the same time the armies and civilian populations had to have more meat. So dairy cattle were killed to supply this demand and because there wasn't enough feed to keep them alive. As the war continues these conditions may be expected to become more acute and the slaughter of European dairy cattle to increase. Therefore the demand for American dairy products, which has grown by leaps and bounds during the last two years, will be larger and larger as the war lasts. And when the war ends we must continue to supply these nations until they can rebuild their herds, and we will be called upon for the breeding cattle from which these devastated dairy herds will be replenished. If we are to be prepared to respond to these demands, we must begin now to increase our own dairy herds.

Before the war we imported much larger quantities of dairy products than we exported. The trade balances have shifted until the situation is now exactly the reverse—we export much more than we import. For the fiscal year of 1914 we imported \$15,000,000 worth of dairy products and exported \$2,966,000 worth. For the fiscal year of 1917 our dairy imports decreased to \$8,000,000 and our dairy exports climbed to \$49,000,000.

During 1914 we imported 64,000,000 pounds of cheese and exported 2,500,000 pounds. For the fiscal year of 1917 we have imported only 15,000,000 pounds but have exported 66,000,000 pounds of cheese. Our 1914 exportations of condensed milk were 16,200,000 pounds, while the 1917 exportations were 259,100,000 pounds.

It is apparent that if this ratio continues we must have a substantial increase in our dairy herds in order to meet both domestic and foreign consumption.

#### How Milk Is Used

According to experts of the dairy division of the United States department of agriculture, the 1917 milk production of our country is 89,547,500,000 pounds of milk, from 22,768,000 cows. We use that milk this way: 39,600,000,000 pounds for butter making (yielding 1,650,000,000 pounds of butter); 36,500,000,000 pounds for drinking; 4,200,000,000 pounds for cheese (making 420,000,000 pounds of cheese); 3,150,000,000 pounds for ice cream (making 210,000,000 gallons); and 2,437,500,000 pounds for condensed milk (making 975,000,000 pounds of condensed milk).

This shows that slightly more than 44 per cent of our total milk production is used to make butter. However, in butter making only four per cent of the milk actually goes into the butter and 96 per cent remains as a by-product, in the form of skim milk or buttermilk.

On this basis we have had, as a by-product of butter making this year, 32,679,360,000 pounds of skim milk. That amount of skim milk could be made into 4,901,904,000 pounds of cottage cheese. And that much cottage cheese would contain 1,024,497,936 pounds of protein—more protein than is contained in all the beef eaten in the United States in a year. (In 1915 the total protein in the beef eaten in

this country was 953,580,000 pounds.)

This will suggest the enormous opportunity for food conservation in the utilization of skim milk, in the form of cottage cheese, for human food instead of feeding it to live stock or throwing it away.

Of course, when skim milk is fed to young stock its food value is not entirely lost—but it is not fully utilized. For skim milk is worth much more as a human food than as an animal food. There is an urgent war need of producing more meat, but the point is that by feeding less skim milk to stock and eating more cottage cheese ourselves we derive the maximum food value of skim milk—and this can be done without decreasing meat production, for, generally speaking, pigs and calves are fed more skim milk than they convert into meat. Obviously it is not economical to use, unnecessarily, for stock feed, a food that can readily be used for human beings—more especially when other feeds that can not be used directly by humans can replace in whole or in part the skim milk ration for animals.

Fed to a pig, 100 pounds of skim milk, combined most advantageously with other feeds, will produce 4.8 pounds of dressed pork. The same amount of skim milk, made into cottage cheese, has the protein value of 22.5 pounds of pork. Furthermore, from 100 pounds of skim milk made into cottage cheese there remains about 80 pounds of whey, which has a feeding value of about half that of skim milk. Properly combined with other feeds the 80 pounds of whey should produce 1.9 pounds of pork. Accordingly, by making cottage cheese and feeding the whey to pigs, 100 pounds of skim milk has a protein value of 24.4 pounds of meat, as compared with only 4.8 pounds if it is all fed to pigs.

By a more efficient utilization of skim milk and other by-products, by conserving stock, breeding for herd

increases, applying the most advantageous feeding and management methods, the dairyman will be performing a patriotic service—and, of course, as he adds to the efficiency of his industry and reduces dairy product waste he will make the business more profitable.

#### CREAM REQUIRED TO MAKE BUTTER

If cream contains 15 per cent of butterfat it requires 5.71 pounds of cream to make a pound of butter. If cream contains 20 per cent of butterfat, 4.28 pounds of cream will be needed; if 25 per cent butterfat, 3.42 pounds; 30 per cent butterfat, 2.85 pounds; 40 per cent butterfat, 2.14 pounds.

There is little excuse today for a farmer not having pure bred hogs, or at least high grades of the same breed which will breed true to size and color. They cost very little more to start with than cross-breeds or scrubs and cost no more and oftentimes less to keep. The uniformity and beauty of a herd creates a greater interest in care and feeding, which always means money in the pocket of the owner.

Why do not farmers raise more sheep? They are the easiest to handle of any livestock on the farm. They can be fenced much cheaper than can horses or cattle or hogs. A fence two feet high will often turn them. Sheep are great weed exterminators. In this way one would be utilizing the weeds to some profit, where now they are going to waste.

Including creameries, cheese factories, elevators and other farmers co-operative effort, there are 12,000 farmers' cooperative organizations in this country. The annual business of these concerns is \$83,000,000. In the matter of cooperative purchasing organizations Minnesota leads.

Now Riverside County is getting ready for a squirrel campaign.

## International Tractor Service

WISE tractor buyers insist upon these three features in their machines:

The tractors must operate on the cheapest fuel a farmer can buy. They must be so simple that the farmer or his help can learn to operate them. They must do enough good work in the field and at the belt to more than pay for

of the machines, before and after purchase; the supplying of repair parts as promptly as circumstances will allow; and the furnishing of expert help to make the more difficult repairs properly.

Keep this service feature in mind when you come to buy your tractor. It applies equally to our Mogul 10-20-h. p., Titan

themselves. International, Mogul, and Titan kerosene tractors meet all three of these demands.

International Harvester tractor owners get, through our 89 U. S. branch houses, a service that enables them to keep their tractors going whenever there is work for them to do. It includes necessary instruction in the care and handling

10-20-h. p. and International 15-30-h. p. tractors. It will be difficult for us to furnish your tractor as soon as you want it. The demand is hard to keep up with and shipping facilities are very much handicapped. Send for catalogues now, make your decision as soon as you can. Be ready for the heavy rush work of early spring.

### Gas 'em!

Kill off the whole crew of crop destroyers—squirrels, gophers, prairie dogs, etc.

Gas 'em with Carbon Bisulphide quick'y, easily and economically. One burrow of squirrels will destroy more grain than your family can save in fifty wheatless days. Remember—these ground pests cost the farmers of the Pacific Coast more than \$6,000,000 last summer. So be forehanded—be truly patriotic—conserve the seed in your fields.

The University of California says: "From November until the end of February (the rainy season in California) the best way to attack the ground squirrels is to fill their burrows with gas from Carbon Bisulphide."

So too in other states! If the ground is full of moisture, whatever the month may be, Carbon Bisulphide is the best killer of squirrels, prairie dogs, gophers, etc.

A squirrel killed before March is worth a dozen killed later. Because—most young squirrels are born late in March or early in April. So gas the old squirrels now. Write today for prices and interesting folder telling how Carbon Bisulphide—the profit-saver—works.

WHEELER, REYNOLDS & STAUFFER  
626 California Street

### Use CARBON BISULPHIDE

## The Baby Chick and Its Mother

Written for California Cultivator By Jean A. Koethen

**E**ACH spring when the lengthening January days begin to turn the fancy to thoughts of hatching, I sit down and with closed eyes try to visualize the needs of the beginner who is going to raise chicks this year for the first time and doesn't know how to do it. There is nothing new to be said. The baby chick is a very weak, simple little creature and its wants are equally simple. But sometimes new experiences turn the thoughts in a new direction and stray bits of knowledge are picked up where one would have thought nothing was to be found. A letter received the past week from a Cultivator subscriber reminds me of one phase of chick raising which I had almost forgotten. She says: "My chicks are dying, and when I open them I find they are all alike, each one containing a hard lump of the yolk of the egg. Some have bowel trouble, others just get lighter and lighter till they die."

That hard, undigested yolk, and the fact that 33 chicks out of 50 have gone the same way before they were three weeks old is sufficient evidence to my mind that these chicks are dying of bacillary white diarrhea. This kind of diarrhea is different from the ordinary kind, produced by chilling, in which the chick pastes up behind but frequently recovers when given sufficient warmth. The chick with bacillary white diarrhea never recovers, and it is better that it does not, for it would only serve as a carrier for disease germs. Bacillary white diarrhea is not caused by errors in the care of the chick. It is an infection from the hen that laid the egg and was in the egg—before it was hatched. The best of care would not prevent its development. Happily such cases are rare. Most of the chicks that die in our back yard flocks die from easily preventable causes, and the cause that is at the bottom of probably 90 per cent of the deaths that occur the first two weeks of the chick's life is lack of mothering.

There are three kinds of mothers; the artificial kind that cares for a thousand or more chicks at once, and does it very efficiently everything considered; the hen mother, a temperamental creature of whom there is no better description than that of Longfellow's little girl,

When she was good she was very, very good,  
And when she was bad she was horrid.

and the human intelligence, be it that of man or woman, that has to run either of the other two. Myself, I would rather run a good brooder than a bad hen.

Here is a case in point, another page out of the past year's experience. Last spring the hatching was not a success with me. In the first place I was hatching "boughten" eggs, expensive, blue-ribbon eggs that I was so anxious to make the most of that my own nervousness may have increased that of the hen. In the second place I was hatching with young hens, and the young hen, going through her first experience of maternity, is an uncertain creature at the best. At the worst she is an unmitigated failure. Not one of these hens, and there were four or five of them, failed to smash at least one of these blue-ribbon eggs before hatching time came, or to kill at least one chick before it was safely out of the shell, and one killed half

her hatch. Their mothering was a greater failure than their hatching, and nearly half those chicks died the first week in spite of all my efforts to keep them warm, with stuck-up eyes and rattling throats.

In striking contrast to these Buff Orpingtons was a little Rhode Island Red that last September hatched 16 chicks from 17 eggs and raised every one. She was a little thing, too tiny to cover a dozen eggs, you would have said, but of that quiet, gentle disposition that rejoices in motherhood and thinks of nothing but the comfort of the family.

Is any lesson to be learned from these two incidents? I learned one, and that is, select your hen mothers as you would a brooder. If the hen you have put your eggs under proves restless and uneasy, put another in her place as soon as possible. If there is no other and the restless hen must do the hatching, don't let her mother the chicks. A jug of hot water is a better mother and more easily managed.

The first need of the baby chick is warmth. No matter how carefully you feed, if the chick is not kept perfectly warm the first four days there will be trouble. It may be diarrhea, with the pasting up behind that is such an alarming symptom to beginners. It may be closed or sticky eyes or rattling in the throat. The chick may die at once or it may be stunted so that it never grows as it should. The chick that is warm lies and sleep the first 48 hours, and this is the best test of temperature. When your hen mother sits quietly on the straw in the corner of the coop with the chicks all covered by her wings or with a little head peeping out here and there, the chicks are warm. When you find her scratching and the chicks huddled in a corner be sure they are not warm. When you look into your brooder at night, and see the chicks all spread out, sound asleep with their heads poked out under the edge of the curtain, you may know they are warm. If they are standing or crowding together, do not be surprised if next morning you find dead chicks on the brooder floor. Don't let any one tell you the chicks died because they were crushed under the others. They died because they were cold and for no other reason. Some may have been crushed in their effort to get warm, but it was cold that was at the bottom of it.

When a brooder must be used, see that it is just large enough to hold the chicks you have comfortably. It is more difficult for chicks to keep warm when they are surrounded by air space than when they have something to cuddle against. The chick that is mothered in the natural way has from the first moment something warm close up against it. One has only to watch a little motherless brood on a chilly day crowding around a jar of hot water to realize how vital is this need not only of heat, but of something warm that it can feel. When chicks are raised on a large scale the temperature of the brooder house must be kept very high to make up for the lack of this soft motherly touch.

The use of the Philo fireless brooder is not as general as it was a few years ago, and yet the fireless brooder has some good points. The principle on which it is constructed is that of keeping the chicks warm by the heat of their own bodies. In order to do this, they must be warmly covered and have plenty of straw under them. It

is necessary that the brooder box be of just the right size, about a foot square for 25 chicks, and that there be not less than 25 chicks, for a smaller number than this cannot keep each other warm. I would rather keep chicks in a box like this in a warm room at night (the incubator cellar is not a bad place) than trust them to an

indifferent hen, but when any plan of artificial brooding is followed the caretaker is the real mother and must give incessant attention till the chicks are "brooder-broke," that is, till they have learned where to go when they are cold. Once they have learned this, they will keep themselves warm if only there is a warm place for them.

## When is a Contract a Contract?

Cooperation Is Strengthened by Court Decision in Matter of Suit of Poultry Association of Southern California to Enforce Contract

Something over a year ago poultrymen of Southern California, driven to some step to save the industry, organized a cooperative marketing organization. Prior to that Central California had organized along same lines, both asking aid of State Market Commissioner Weinstock.

Naturally cooperation necessitates sacrifice of individuality and means greater efficiency. After contracts were made and a year's expense planned, individuality on the part of a few members of the Southern California organization began to assert it-

self, and, regardless of contract provisions, some producers withheld eggs and marketed under private contracts. Result: chaos and disorganization—at least in sight — unless the contract could be enforced. Hence suit in the Superior Court of Los Angeles County.

After several days the trial ended with award of \$230 to the Association and a verdict that the contract is valid.

This will strengthen the hands of cooperators and be a long step in advance in the problem of marketing agricultural products.

## My Friend the Canary

**T**HE canary, the cheeriest of household pets, deserves a place in every home, says Loretta R. Moore in Rural New Yorker. She gives directions for their care. They are such lively, happy little creatures, perfectly contented all day long and will sing no matter where you put them. The cage should be at least ten inches long, seven inches high and wide, and preferably of brass, which is easier kept clean; should hang from four to six feet from the floor.

Birds require a temperature of from 68 to 80 degrees Fahrenheit. If the room is cooler than this at night the bird should be covered. Do not hang your bird right in front of the window. When hung from the ceiling a little at one side he will get all the light and not feel the cold that comes through the glass. Be very careful about drafts at all times, as birds are as susceptible to colds as concert singers, and not as easily cured.

### General Care

Birds love a sunbath, but never place them in the mid-summer sun without some shade, and keep out the summer sun at noon. It is best not to hang your bird out of doors in the summer as he is so apt to catch cold. Possibly on a sultry day when the wind does not blow he might be put out of doors for a couple of hours in the middle of the day.

So many people say to me, "My bird does not sing." I ask them, did he hang out doors last summer or in front of the window last winter. "Yes, he hung out all summer, and I do put him in the window." It is best to keep your bird well and you will not have to doctor him.

### Feeding

When purchasing a bird go to some reliable person and pick out a healthy bird, and there will be less danger of its getting sick. Young birds have pink feet. The two kinds usually found in bird stores are the Hartz Mountains birds, or natural singers that have received but very little training, and the St. Andreasburg Rollers, which have had the best of training from the first. Canaries are said to be the greatest gluttons in the animal kingdom, so beware and do not overfeed. Feed one-third rape and two-thirds canary seed. Give fresh water and gravel daily; in summer fresh water twice a day. Keep cuttle bone always in cage. Every few days give a bit of green food, lettuce, chickweed, apple if it is ripe and not too sour. Do not feed hemp seed. Once or twice a week and all through the moulting time feed the egg mixture (described later), and if he should be

ailing he relishes soft food more than seed.

### Insect Parasites

One of the greatest enemies the birds have is lice or mites, but if proper precaution is taken you will have little trouble. Place damp white cloth on cage for an hour in the evening, or allow to remain all night. You will see tiny red mites on it when removed. Scald cage occasionally and paint end of perches and where swing hangs with coal oil. Wash cage with soap and water once a week, and either wash and dry or scrape perches often. Dust bird with mite exterminator. Allow bird to bathe every other day, twice a week in cold weather.

### Other Care

Manicure bird occasionally; catch and hold to the light; cut the nails just beyond the red vein in the foot or toe. If feet are sore or scaly, soak in warm water for several evenings, dry and apply a little vaseline. Moulting season with canaries is in July, August and September. They are weaker during these months, and should have the best of care. Keep out of draft, feed cracker and egg mixture often, with a little song food and some green relish. The German remedy for all bird ailments is a small piece of salt fat pork, rubbed over with cayenne pepper. The egg mixture consists of the yolk of an egg boiled twenty minutes and three or four oyster crackers, pulverized, and a generous pinch of cayenne pepper. This can be slightly salted. Mash fine and mix well. Great care should be taken in selecting seed, as inferior seeds are substituted and are injurious to the birds. The small round brown seed is rape, and tastes sweet, and if your seed should be bitter do not feed it, as it is mustard or some inferior seed. The light seed is Sicilian canary, and should be bright and shiny. Some bird seed mixtures have millet, which will not hurt the bird, but he does not require it.

Birds kept by these directions will be healthy, happy, and very little trouble. It is necessary to know your birds and love them if you would be successful. Try to gain their confidence, move slowly when working by the cage, avoid all quick motions which might scare them. Give your bird a name and talk to it, and you will soon find that it will become well acquainted with you. If it is necessary to catch the bird, put the hand in slowly and do not attempt to catch him until you are sure the opportunity is right for it. Hold him carefully with his wings closed so he cannot flutter or ruffle his plumage. It is a good plan to let the bird out occasionally and fly around the room. Exercise is very beneficial and it makes them happy.

# Kill Squirrels Gophers

The only exterminator that is 100 per cent efficient and guarantees results or money back, is

**KILMOL**  
**SQUIRLGOPHENE**

It contains special chemicals. Kilmol fumes not only asphyxiate the squirrel or gopher, but eat away their lung tissues. Even should the animal reach fresh air, he can't survive. No other exterminator is as effective as Kilmol. That's why Kilmol costs a little more—but economy in labor warrants the advanced price. For best result use prepared waste balls saturated with Kilmol.

New formula of U. S. Government Poisoned Barley is effective in dry weather. Kilmol and U. S. Government Poisoned Barley are used and endorsed by the biggest and most successful ranch owners.

Remember, results guaranteed or money refunded.

Your local dealer carries Kilmol, Waste Balls and U. S. Gov't. Poisoned Barley.

# MOLINE Tillage Tools

No matter what your tillage requirements may be there is a Moline Harrow just suited for your work. For orchard or field, with horses or with tractors, Moline Harrows do thorough work, give long, lasting service, are easily operated and light in draft.

## Moline Spring Tooth Harrow

Built for hard usage. Two-inch channel bars, heavy tubular steel tooth bars and teeth of finest spring steel, hardened in oil, give exceptionally strong construction. Furnished either with runners or wheels in 1, 2 or 3 sections.

## Moline Reversible Low Down Disc Harrow

Just the harrow for orchard work. Wide or narrow frame extensions can be provided for harrowing under overhanging branches. Disc gangs can be easily reversed or tilted. Can be equipped with guards to prevent injury to overhanging branches. Well constructed with dust proof bearings.

## Moline Three-Lever Disc Harrow

An extremely flexible, deep penetrating, light draft disc harrow. Frames so constructed that the gangs do not bump or ride. Pressure of the disc gangs is regulated by a lever. Difference in pressure between gangs is perfectly equalized. A tandem attachment can be furnished to make a double cut harrow. A great variety of sizes with round or cut-out discs can be provided.

## Moline Engine Disc Harrow

A heavy, powerful disc harrow built especially for use with heavy tractors. Pull is direct from three large, dust proof bearings on each gang—the only correct method. Heavy springs take up end thrust of the gangs. Extreme flexibility between disc gangs.

You cannot go wrong in selecting from the Moline Line of tillage tools; they are correctly designed and built in the best possible manner.

See your nearest Moline dealer, or write us for illustrated folders. Address Dept. 56

## Honey Marketing Agreement

SINCE the Los Angeles convention of California bee keepers, in which it was endeavored to evolve some marketing scheme, committees have been at work on a form of marketing agreement. The one which has been most generally accepted is given in the form below. There may be some changes before signing up, and some producers are protesting against centering so much power in the hands of one committee, but unless the members can find an impartial and business like committee which will handle the affairs of the association we believe it is better not to form such an association. If people are to cooperate, they must cooperate, and that means they must secure someone capable of handling the business and trusting absolutely to them. The Cultivator believes that when a contract is entered into it should be so iron clad that association plans may be made for a year without any change, that the members will stand behind any plans for that year or for the term of the contract. The form of agreement is:

### Marketing Agreement

This agreement, between the ..... Beekeepers' Association, a non-profit association without capital stock, with its principal office at ..... California, hereinafter called the association, first party, and the undersigned beekeeper in said state, hereinafter called the producer, second party. Witnesseth:

In consideration of the mutual obligations herein, and of a prior agreement executed by the producer and of membership in the association and in compliance with the by-laws thereof, and in pursuance of the express aims of the association, for cooperative marketing, and of similar obligations undertaken by other beekeepers:

1. The producer hereby agrees to consign and deliver immediately after the crop is ready for market, under the conditions hereinafter set forth, to the association as his agent, or at the order of the association, as his agent, and not otherwise, all of the products of his bee colonies during the years 1918-19-20, except such portion of the crop as he may retain for personal use or may sell for local consumption only, or may reserve for feeding.

2. The producer hereby appoints the association his agent, coupling said agency with a direct financial interest as the common agent of producers hereunder, for consigning or marketing or storing or selling any and all such products; and for purchasing necessary materials for the use and account of the producers hereunder; and the producer authorizes the said association to pay on his account all actual costs of freight, cartage, loading, warehousing, insurance, selling and any other proper charges not here specified, and in addition, authorizes the said association to deduct and retain an association charge, in the discretion of the association, not in excess of 2½ per cent of total sales f. o. b. local shipping point, California, from the moneys due or payable to the producer out of the sale or marketing of any and all of his said products.

3. The association charge shall be used for meeting the expenses of the association.

If, at the end of a year's operations, any surplus remains out of the said charge, the association may use the

same for any purpose of common advantage or profit to the producers, or may refund the surplus, or any portion thereof, to them, in proportion to their shipments to or through the association.

4. The producer further appoints the association his agent and attorney in fact, subject to the terms hereof, and authorizes the association to settle in his name any claims for damages which may occur to such products in transit; to fix a reasonable price at which his products may be sold; to act for the producer as his agent in negotiating loans on his crops, at his express request; to store any and all of his products, and to sell the same on his account and to pay him the net proceeds, less all costs and the deductions herein provided; and to deliver or cause to be delivered any or all of his products to any dealer or distributor with which the association may have theretofore contracted; to take possession of any and all products ready for delivery or shipped by the producer other than as directed by the association.

5. The producer agrees to prepare his products for shipment, and to deliver them at the nearest convenient common shipping point to the association for marketing for his account, or to ship and deliver them as and when directed by the association and on such terms as the association shall be able to secure; and the producer shall receive his warehouse or other receipt therefor.

6. (a) The association may make rules and regulations and provide inspectors to standardize the quality, method and manner of handling, packing and shipping of products for direct sale or for any particular purpose; and the producer agrees to observe and perform any such rules and regulations prescribed by the association.

(b) All products delivered to or at the order of the association hereunder shall be of the standard and conform to the regulations as to quality and otherwise that may be prescribed by the state authorities or by the association.

7. The association further agrees to sell and market the said products at the reasonable and fair prices obtainable by the association in the open markets or elsewhere, subject always to the conditions of supply and demand, competitive offers and governmental rules and authority. The producer agrees to ship directly to any person under contract with the association such percentage of his shipments as the association may direct, packed as the association may instruct.

8. The association and the producer further agree that the local association may make an agreement or contract with the California State Beekeepers' Association, whereby the said state association may market and control the sale of all the products of the members of this local association and in any such event the producer agrees to be bound by any such contract; and any such agreement with the said state association shall for all purposes be deemed by the producer as a part of the selling or marketing arrangements provided for in this agreement and the producer shall be fully obligated thereunder.

9. This association or the state association shall market and sell the bee products of the producer, mingled

CHICO, CALIFORNIA, U. S. A.

with the products of like variety and grade delivered by other producers named in contracts similar to this, at the reasonable and fair value thereof; and the producer agrees that his products shall be so handled and mingled and that the returns therefrom, less brokerage and all other costs and charges and advances and the association charge, shall be credited and paid to him on a proportional basis out of the amounts received by the local association during the season from the sale, direct or otherwise, of all such bee products of each variety and grade.

10. The association may advance to the individual producer whatever it may be able to borrow on the warehouse certificates or receipts of the individual producers, or on the bee products delivered by the individual producer, less any amounts theretofore advanced to the said producer by the association, on crop mortgage or otherwise.

The association, in the discretion of its board of directors, may advance to the individual producers sufficient to cover the cost of cans, cases or other necessary materials, in an amount, however, not in excess of fifty (50) cents per colony for each individual producer, said advance, and all other advances, to be deducted from the proceeds due or payable to any such producer immediately upon the receipt thereof by the said association.

11. This agreement shall be binding upon the producer during the period above mentioned, as long as he has the legal right to exercise ownership or control of any bee products during the term hereof.

12. This agreement is one of a series, identical in terms, composing, with all such agreements signed by individual producers, one single contract between the association and the said producers, mutually and individually obligated under all of the terms thereof.

13. The producer agrees that, in

the event of the breach by him of any material provision hereof, particularly as to delivery and marketing of any bee products other than or to or through the association, the association shall, at its option and upon proper action instituted by it, be entitled to a decree for specific performance hereof, according to the terms of this agreement; and the association and the producer expressly agree that this agreement is not a contract for personal services and that this agreement depends reciprocally upon every similar agreement for its full force and effect and will be the proper subject for the remedy of specific performance in the event of a breach.

14. If the association brings any action to enforce any provisions hereof or to secure specific performance hereof or to collect damages of any kind for any breach hereof, the producer agrees to pay to the association any reasonable attorney's fee expended or incurred by it in any such proceedings.

15. Inasmuch as it is now and ever will be impracticable and extremely difficult to determine the actual damage resulting to the association should the producer fail to so consign and deliver his bee products, the producer hereby agrees to pay to the association \_\_\_\_\_ cents (\$\_\_\_\_\_) for each \_\_\_\_\_ of bee products sold, consigned or marketed by or for him other than in accordance with the terms hereof, as liquidated damages for the breach of this contract, all parties agreeing that this contract is one of a series dependent for its value upon the adherence of each and all of the contracting parties to each and all of the said contracts.

Bee Diseases

Written for California Cultivator By E. Ralph de Ong

HERE are a number of diseases attacking bees which have caused serious loss in the past, but those causing the greatest trouble are known as "foul brood," of which there are three types: the American, European and sacbrood, or pickled brood. These diseases attack bees in the larval condition and before coming to the mature stage. The first two are bacterial, and all of them are infectious. The bacteria may remain alive in honey for a long time or be found in drawn comb or parts of a hive containing diseased bees. It is commonly spread from hive to hive by robbing, introducing diseased colonies or honey from diseased apiaries, or allowing the bees access to honey containing the bacteria.

Examine a colony closely before purchasing it and note any sign of dead larvae in the cells; dried black scales still attached to the cell wall, sunken caps over the cells, often with a tiny hole as if pricked by a pin. In advanced stages a very marked odor will be noticed, whence the name is derived. A hive that shows dead or discolored larvae in the cells should be looked upon with suspicion, the normal color being a pearly white. A positive determination of the nature of the disease can be made only by a

bacterial examination. This is done free by the Department of Agriculture, Washington, D. C., from which place also literature may be secured on the control of such outbreaks.

Fortunately the European type of the disease is more common than the American foul brood, the latter being a very dangerous disease. Our beekeepers are now learning to handle European foul brood; and especially if the apiary has been Italianized it is not considered a serious menace, although no one cares to introduce it into his apiary. These diseases are not so easily discovered in late fall or winter but are more active in spring and early summer, and only at this time can a determination be made readily of the condition of a hive or apiary. This point should not be neglected in beginning or increasing an apiary. Our more prominent honey producing counties have regularly appointed bee inspectors to assist in holding these diseases in check. These men may be consulted at any time and should be of considerable assistance to beginners in giving assistance as to local conditions.

VIRTUES OF THE MULE

The mule is patient, fond of work. His virtues well bear sifting; Besides, the business end of him Is always so uplifting!—Life.

Learn What Good Tractors Do  
Send For Our Tractor Book

THE Bean TrackPULL Tractor—6 h.p. at drawbar—cultivates from ten to fifteen acres or plows from four to seven acres in ten hours, without getting tired like a team. It plows and harrows as close up in the corners and as close to vines and trees as a team.

In orchards it passes under branches only four feet off the ground. It pulls instead of pushes itself along. It "gees" and "haws" out of holes and soft places just as a team will do. Then it turns clear around in a ten-foot circle (5-foot radius) and pulls with its full power on the turns.

When it isn't at work in the field it runs stationary machinery up to 10 horse power.

The Bean TrackPULL weighs less and costs less to run than wheel-type tractors of same power. And it does things no other tractor can

do like turning clear around in a 5-foot radius and pulling with full power on the turns, because of invaluable patents. Don't make a mistake. Don't be sorry, too late, that you didn't get a Bean.

Write now for the free book that tells all about it. Why spend 2½ hours a day in simply caring for horses when a tractor will save that time. You don't need more land to increase your earnings if you get the right kind of tractor. Send the coupon now. Learn what you can do with a Bean TrackPULL on your place.

Why Europe Makes Bigger Crops  
Than the United States

Average Production of European Crops is as Follows:

Wheat ..... 33 bushels per acre  
Oats ..... 45 " "  
Potatoes ..... 199.84 " "  
Cotton in Egypt, 400 pounds " "

Average Production of American Crops is as Follows:

Wheat ..... 14 bushels per acre  
Oats ..... 40 " "  
Potatoes ..... 97.15 " "  
Cotton ..... 185 pounds " "

Europe uses a Home-Mixed Nitrate Fertilizer containing 8 per cent of Phosphoric Acid and 4½ per cent of Nitrate Nitrogen.

America uses a Fertilizer containing 8 per cent of Phosphoric Acid and 2 per cent of Nitrogen which is mostly unavailable.

The difference in yields is largely due to larger amount of Nitrate Nitrogen used in Europe per acre as Nitrate of Soda. Our small American acre yields are due to failure to appreciate this necessity.

### TREES

**For Sale or Exchange**—5000 Eureka lemon trees selected buds inspected stock now located Riverside County. Submit best cash offer or advise fully what you have have for exchange. Chas. S. Brown, 1318 Santa Fe Ave., Los Angeles, Telephone A-9260, Main 7164.

### HOGS

**The Billiken Brand of Chester Whites**—There is right now a big shortage of swine in California. The output of 1918 will show even a greater shortage unless the farmers of this state get busy and raise more hogs. Good breeding stock is scarce and hard to get. THE BILLIKEN BRAND represents the best obtainable; they are of that mellow type that mature early and are such satisfactory easy feeders. Get started with this strain and help out the Food Administration and your own pocket as well. Write me your wants—do it today. I can still furnish first class animals at reasonable prices. C. B. Cunningham, Mills, Cal.

**Grape Wild Farm Berkshires and Guernsey Bull Calves**—Only a few more boars left from 6 months to a year old, sired Grand Leader 2d, the Grand Champion of the world. Also a few of the tops from our fall litters by Royal Superbus and Fashion Longfellow 37th, and a few bred gilts. Our herd won the Premier Breeders' Ribbon at the P. P. I. E. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

**Bernsteins Herd**—"One of the Best in the West" has three great herd boars. King's Big Bone Leader, Young Jumbo, and King's Massive Orange. Watch for the sensational offering of sows bred to this great trio which will sell in the Big sale of the Kings' County Poland-China Breeders at Hanford, February 20. Bernsteins Ranch, Hanford, Cal., W. Bernsteins, Proprietor.

**Large Type Poland-Chinas**—The hog for the farmer if he wants to make money. I have the best lot of weanlings that I have ever seen and they are sired by my boar, Long Smooth Jumbo and if he keeps on growing the way he is, his name will soon be too small. H. Christiansen, R. D. 4, Riverside, Cal.

**Superba, World's Grand Champion** Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

**Duroc-Jerseys**—Sold out of bred gilts. Two service boars. One of them an outstanding individual for sale. Also Fall Figs, both sexes. Twenty-three ribbons on 11 entries, including 6 championships, State Fair, 1917. Frederick M. Johnson, Napa, Cal.

**Berkshires**—First prize junior boar; first and second senior boar pigs including junior champion; fifteen spring and fall open gilts sired by Ames Rival 115, champion boar; and two junior yearling bred sows priced cheap for immediate sale. F. D. Hall, Perris, Cal.

**We Pay Cash for Hogs of All Sizes**, weights and breeds. Any number from one to several thousand considered. What have you? Durbin and Forbes, 722 San Fernando Building, Broadway 4170, Los Angeles.

**Large Yorkshires**—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

**PLW Durocs**—Eastern selections made by R. K. Walker in January. Peters, Lamson & Walker, Devore, San Bernardino County.

**Large Type Poland-Chinas** are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, Cal.

**Rancho Rubio Durocs** all sold out except some choice fall boar pigs. Write for prices. Elmer Lamb, Ceres, Cal.

**Should Like to Dispose of 1000 hogs**, or hog feeders, weigh 75 to 150 lbs. Address E. F. Sanguinetti, Yuma, Arizona.

**Greenwood Farm Durocs**—"Size with Quality." H. C. Witherow, Palo Cedro, Shasta County, Cal.

**Berkshires**—Sired by Star Leader, the \$1500 boar, ready for service. Kounias Registered Stock Farms, Modesto.

**Durocs**—P. & L's Defender by Defender heads herd. Joseph Prendergast, Route 2 Box 37A, San Bernardino, Cal.

**Registered Durocs of the big type**—Cholera Immune. Derrifield Farm, Odd Fellows Building, Sacramento, Cal.

**Carruthers' Farm Berkshire Hogs**—Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

**Poland-Chinas**—A few good breeding boars. S. F. Williams, Orland, Cal.

### MISCELLANEOUS

**Famous Hairy Peruvian Alfalfa Seed**—Highly recommended by U. S. department of agriculture. Only carefully selected seed shipped. Prices and samples gladly furnished on application. E. F. Sanguinetti, Yuma, Arizona.

**To Reduce the high cost of living**, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

FOR EXCHANGE

**For Exchange—1600 acres, most of it well** timbered with expensive woods. Republic of Panama, four miles from Atlantic Coast, for farm or stock ranch in Central or Northern California. E. B. Goodrich, 337 S. Hill St., Los Angeles.

Household Department

TO THE SIERRA NEVADA

Written for California Cultivator  
By Mrs. Guy Halley

O, thou mountains of unvarying splendor,  
Whether it be morning's sun-kissed glory  
Or sunset's shadowy veiling mists  
Showing me the wonder of Nature's story,  
I love thee still.

Or mayhap thy crowns by light swirling  
clouds  
Are made fanciful to behold,  
Or anon the dark clouds, low 'round thy  
sides,  
Are cleft with the lightning's flame of  
gold,  
I love thee still.

Perhaps all on a hot summer day,  
Amongst the dry herbage on thy sides,  
Volumes on volumes of dense smoke  
arise,  
And between the insidious fire fiend  
glides,  
I love thee still.

To me in this fertile valley,  
O mountains! you are a constant de-  
light;  
Ever changing yet ever the same,  
You seem to speak of God's wonder and  
might.  
And O, I love thee still.

THE CAKE THAT WAS NEVER CUT

**T**HE chores were all done, the kindling was drying by the stove for morning, a pan of corn for the chickens was drying in the oven, and Cyrus, seated by the kitchen fire, was shelling beans while Molly washed the supper dishes. Whenever they had talked with each other during the day it had not been about their real thoughts and feelings; for their thoughts and feelings found expression in a sympathetic understanding rather than in words.

It had been a bright and warm October day. The smoky haze, settling low over the marsh and corn fields, gave the distant hills a blue cast and made the sun look like a big ball of fire. The white strings of cobweb, drifting here and there, had gathered on the fences, corn shocks and the remaining stalks of weeds. But the cold air of the evening gave promise of a heavy frost.

After finishing the supper work, she sat by the kitchen fire to knit; and Cyrus, having shelled his usual stint of beans, went out to the barn to see that everything was all right before he went to bed.

"Roxy, you are lonesome since your master went to war," said Cyrus, giving his son Ned's driving horse a little extra feed.

Roxy whinnied plaintively.

Molly had been up in the attic after dinner that same day to see the wooden cradle Cyrus made in which she had rocked Ned to sleep so many, many times; and it seemed to her that his cooling call and sweet smile lingered in it still. She was living over again the good days of early family life—the days of golden curls, bare feet, Christmas stockings, and boyish experiences sad and pleasant that are recorded only in a mother's love. Now, in war time, everything was so foreign to her plans and unrelated to her faith that she could not think it through, although her thoughts followed her son across the dangerous sea to somewhere in France. That word "somewhere" was so indefinite! The uncertainty of it all became more distracting as she quietly went up to Ned's room where she had so many times kissed him good-night. Down deep in her heart she was proud of her brave soldier boy; and she would not have it otherwise; but she was learning the cost and joy of sacrifice.

She opened Ned's Bible they had given him one Christmas and read a verse that he had marked: "For God so loved the world, that He gave His Son—" and then, resting her head on her folded arms across his Bible, there came to her a helpful assurance that Old Glory was waving over him and that he could not go beyond his Father's love.

"Come," Molly," Cyrus softly said. "let's light the candles."

"It was 28 years ago today," she replied, "that Ned was born."

"Yes; I have been thinking about it all day."

They stood by the dining table, close to Ned's portrait, and watched 28 candles burn away on a birthday cake that was never cut.

Next day the rural carrier brought Cyrus a letter with a foreign postmark, and in it was this statement: "Your son has been decorated with the French Cross of War for valor. He is in the hospital, slightly wounded, but will soon be out again, as well as ever. He sends his love to you and says: 'Kiss mother for me and tell her I'm coming home on a furlough next month.'"

Cyrus read the letter in two winks, delivered it and the kiss to Molly in two jumps, and then, to hide his feelings, he rushed to the barn, hugged Roxy, and gave her an extra measure of oats from "somewhere in France." —LeRoy C. Patch in Farm Journal.

EAT POTATOES

The United States food administration is planning a consistent campaign to increase the use of Irish potatoes. Grocers will be urged to inaugurate a "potato day" each week, selecting whatever day is slack in deliveries and making a special price for potatoes delivered on that day. Housewives will be asked to buy potatoes, a week's supply, on potato day. The administration wishes to place the Irish potato, every day in the year, on every table in America.

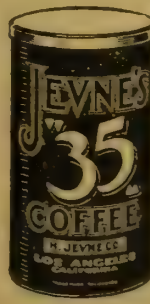

VANITY FAIR

Across the Hall: "Say, Bill, can I borrow your dress suit?"

Back Again: "Sure. Why the formality?"

The Other One: "Well, I couldn't find it."—Chaparral.

Have you told your Grocer yet? "Send Me Jevne's '35, Coffee"

All good housewives now use Jevne's "35," Economical

- Perfectly Blended
- Full Flavored
- Taste is Excellent

A pound of Jevne's Coffee goes further than any other coffee we know of.

Your grocer will supply you

## It takes the fuss out of breakfast

**T**HANKS to Ghirardelli's—breakfast-making is not the job it used to be. There's no fuss—no muss—no time lost.

If a chocolate pot does not happen to be handy—you use an ordinary stew-pan. It takes but a minute or two. And then—you have the most delicious of all food-beverages steaming hot, ready to serve.

An ideal blend of ideal foods—cocoa and pure sugar—Ghirardelli's supplies the maximum nutriment at minimum cost. Always keep a can on hand.

In  $\frac{1}{2}$  lb., 1 lb. and 3 lb. cans; a  
tablespoonful—one cent's worth—  
makes a cup.

D. GHIRARDELLI CO.

Since 1852

## MY IDEAL FARMER'S HOME

By Mrs. A. C. Pickett

RS. PICKETT wrote: "Use this in any way you choose. I read it at our Horticultural Club meeting at Riverside 15 or 20 years ago. This club, by the way, was the first club of the kind in Southern California. It was organized by my father, J. H. Reed. I copied the paper and changed it some. I wish the subject might be written on by others; also 'Working Clothes,' 'How to Interest Children in the Real Farm or Orchard Work,' 'The Literature a Farmer Should Have.' These and many more points as practical would be helpful to many. Yours with appreciation."

Only too well do I realize how much easier it is to write about such a home than to maintain one. But if we never aim at our mark we surely will never hit it! Our Ideal Farmer is not ambitious for wealth in money or lands. He is not forever longing for more land on which to raise more crops to buy more land, ad infinitum. He has a desire to own his home free from debt, to save some for the possible "rainy day," also to help educate his children. He is wise enough to know if they also help, the education will be of more value to them. His boys and girls will receive an education that will equip them for the life of an intelligent farmer, or any other work they desire. They will not leave the farm because it is an unattractive life.

What other occupation gives a man more time to become actually acquainted with his own family? This is denied the wealthy business man of the city, living in a splendid suburban home.

The Ideal Farmer will give himself as well as his earnings to promote the happiness of his family.

The house will be pleasant and as hospitably large as means will allow.

In California verandas are almost a necessity; very plain ones by the help of vines and roses can be made bowers of beauty.

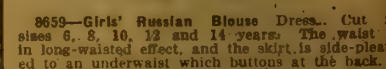

We are benefactors to our community, even, if we do nothing more than make the exteriors of our homes attractive and hospitable in appearance.

This does not require wealth; often the humble cottage with its bright and tidy dooryard, rose covered porch, pretty curtains impresses the passerby more pleasantly than does the stately mansion with its extensive grounds. Nothing adds to the beauty of the dooryard in California as does a plot of grass; even a neatly kept lawn of the despised "devil grass" is better than none. If I could only have one, I would choose grass rather than flowers, but no such choice is necessary; there are many nooks and corners for our flowers.

Inside our Ideal Home, pure air and sunshine will abound. There will be no furnishings so grand and fadeable that they must be kept from the sunshine, which, without money and without price, adds more cheer and beauty to our winter living rooms than anything we can purchase. Still it is in the country that we more often find the "best room" dark and dreary with a funereal air and unused appearance.

In one large city statistics show one divorce to every six marriages. One writer claims that "keeping warm on climate" is one reason for such a condition. The husband comes home from work and, after the meal is over, finds the living room too cool for comfort and not cold enough to bother with a fire, so he goes down town to

## The Cultivator Patterns

8659—Girls' Russian Blouse Dress. Cut in sizes 6, 8, 10, 12 and 14 years. The waist is in long-waisted effect, and the skirt is side-plaited to an underwaist which buttons at the back.

8447—Ladies' Shirtwaist. Cut in sizes 36, 38, 40 and 42 inches bust measure. The long sleeves are gathered into deep cuffs, and the turnovers to match the collar are attractive.

8478—Ladies' Waist. Cut in sizes 36, 38, 40 and 42 inches bust measure. The waist has two tucks at each side of the front, and a box-plait at center front.

8660—Ladies' Envelope Combination. Cut in sizes 34, 36, 38, 40 and 42 inches bust measure. The combination is in high-waisted effect and it is to be slipped on over the head.

8675—Ladies' Dress. Cut in sizes 36, 38, 40 and 42 inches bust measure. The dress has a plain waist with a two-gored skirt gathered at it at the slightly raised waistline.

8362—Girls' Dress. Cut in sizes 6, 8, 10 and 12 years. The waist has a bib-like section of contrasting material and the straight, one-piece skirt is gathered to the waist.

8368—Ladies' Two Gored Gathered Skirt. Cut in sizes 24, 26, 28, 30 and 32 inches waist measure. The skirt has two gores and is gathered all around to the slightly raised waistline.

**PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.**

**HOW TO ORDER PATTERNS**

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City.

Therefore we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

**Pattern Department  
California Cultivator**

**Los Angeles**

"see a man." The wife is comfortable while about her housework, but when she sits down to rest or read is also too cool, so she runs in to chat with her neighbor or goes shopping.

The home thus becomes a mere lodging house and restaurant and arrangement follows.

Be that as it may, our Ideal Home will have some comfortable spot where the family may gather at all seasons. A "smelly oil stove" is better than no heat, a stove better than that, and an open fire best of all.

In summer the veranda comfortably furnished with hammocks, easy chairs, pillows, etc., makes a delightful place for the family and their friends; if screened it is still more pleasant.

There will be games, music, pictures (good ones) and books in our Ideal Home.

Public libraries are splendid and of great use to the farmer's family, but even when accessible they do not take the place of the home library, where the books look down, from their places on the shelves, like old friends. They are where they can be frequently referred to, where we can read according to our mood. Some books that we have read and re-read and read again, marked sometimes by hands long since still, become more precious with time, even the worn and faded bindings we would not exchange for new.

There will be magazines and papers to suit the taste of all. If our farmer can afford city dailies let them be as clean as can be procured—better be a few days behind the times than smirch our children's minds with the vile stuff printed under the head of news!

The Ideal Farmer can not get along without his farm paper—"California Cultivator," of course, giving market reports, up-to-date methods, etc.

He procures and carefully files government reports and bulletins, having them convenient to consult. The mother enjoys the household department. She also has her own magazines, and what is better for boys and girls than "The Youth's Companion"? Generally the whole family read it.

Our Ideal Family will not be dressed in the proverbial "blue jeans" or denim nor the "lank calico dress" and slat sunbonnet. They will dress neatly and becomingly and never be taken for scarecrows in their own gardens!

If it is necessary for the women and girls to help with outdoor work, I advocate a gymnasium suit; then light outdoor work becomes a healthful pleasure. Where the wife is cook, seamstress, nurse and maid-of-all-work, it becomes necessary to choose between an immaculate house and a cheerful atmosphere—the latter rules in the Ideal Home.

Flowers are so abundant in California that the busy housewife often considers it a waste of time to have cut flowers in the house, but they make more beautiful decorations than flowers worked on cloth. The time spent gathering and arranging them is far better for health, eyes and spirits than the same time spent bending over fancywork. However, fancywork does make the home dainty, makes lovely gifts, and often rests mind and fingers.

There should be in every home well-cooked food. Too often it is not appetizing in the farmer's home, where it could be the very best. Variety at each meal is not necessary, but monotony is not necessary either. Clean linen, pretty dishes, fresh flowers exert an unconscious refining influence. In our Ideal Home there

will be welcome guests, and if they are worthy they will share the real everyday life of the family, not an artificial one donned for the occasion. There will be no attempt to ape city ways for city guests; what they love, for a change, is genuine country life.

In this home the week's work will be finished by sunset on Saturday night. Tools will be in their places and everything clean and in order, both indoors and out, so the Sabbath may truthfully be a day of rest.

"To Adam, Paradise was a home; to the good, among his descendants, home is a Paradise!"

#### IDEAS WANTED

Be Sure to Read This!

Look over the letter at the beginning of Mrs. Pickett's article. She has suggested there a number of subjects for discussion which are of personal interest to all of us. Let us hear your views on one or all of them.

For some months we have discontinued our monthly contest feature, making only the offer of three months' extension of subscription for hints furnished. That will be continued as a regular feature, but in addition we will have a February contest of short

articles on any one of the subjects suggested by Mrs. Pickett.

#### Prize Offers

For best article, \$2.00 cash; for second best, \$1.00 cash; for all published, extension of subscription to California Cultivator for from three months to one year, according to article.

Articles will appear in the issue of February 23 and should be mailed to the Household Department, California Cultivator, Los Angeles, before Tuesday, February 12.

Please write on one side of paper only and with your article send name and address of one to whom you wish extension of subscription credited.

#### MORE IDEAS WANTED

A subscriber has requested a variety of recipes for making sandwiches. Here are two, but we want more.

For recipes sent to this office, Household Department, California Cultivator, Los Angeles, will be given three months' extension of subscription for all published. With recipe send name and address of one to whom you wish extension credited.

Please do not send more than two recipes; pick out two that you like

yourself and tell us how to make them.

#### Two Good Sandwiches

This one is made with war bread. Cut thin slices of the bread. Prepare crisp lettuce leaves. Stir in to peanut butter enough water to make a thick cream. Add a little salt to taste. Spread on both sides generously. Place lettuce leaf between and press flat with palm of hand. Cut in two with sharp knife.

Another: Use white bread for this, toasted on one side. Mix a little anchovy paste in thick sour cream. No seasoning is required. Spread on untoasted sides of bread and place together. These are delicious for lunch or supper. Serve immediately, of course, while toast is hot.

Anchovy paste by the way is a good thing to keep on hand. It comes in a tube like vaseline and is pressed out in the same way. It is highly concentrated and will keep months, almost indefinitely in a cool place. It adds delicious flavor to salads and relishes. A large tube costs 25 cents.

#### CLOSE FRIENDS

"It is indeed hard," said the melancholy gentleman, "to lose one's relatives."

"Hard!" snorted the gentleman of wealth. "Hard! It is impossible."—Town Topics.

He Does Better Work  
With Lalley-Light

## Three Moving Parts Instead of Sixteen

On thousands of farms, Lalley-Light is known especially for its constant reliability, its economy, and its long life. Because of the engine's extreme simplicity it has gained this national reputation.

Where the ordinary electric-light-plant engine has sixteen moving parts—often more—our engine has only three. In fact, there is no other light plant that we know of which compares with the Lalley on that score.

Think what such simplicity adds to the life of Lalley-Light—what it saves in wear and tear, adjustment and repairs.

Lalley-Light engine was designed especially to run a direct-connected electric generator.

It has big ball bearings at every point where split babbitt or roller bearings are commonly used. It has sure-fire magneto ignition. It is water-cooled.

It runs with steam-engine steadiness. That is why light direct from the generator is as unflickering as from the battery.

There seems to be no wear-out to this engine. Lalley-Light plants installed more than seven years ago are giving today the same good service they gave in their first year. This record shows Lalley-Light reliability as nothing else can show it. Lalley-Light brings electricity to the farm—unlimited light and power in their safest, surest and simplest form.

Generating plant is 27 inches long, 14 inches wide, 21 inches high. Storage battery is included in complete outfit.

It gives you clean, bright light whenever and wherever you want it. Its power will run the pump, separator, churn, grindstone and other small machinery at a cost of a few cents a day.

Lalley-Light furnishes electric current from two independent sources—generator and storage battery—actually giving the service of two plants for the cost of one.

It saves labor and improves living conditions. It increases the value of your property; it reduces fire risk and insurance rates.

This is the time to figure on installing Lalley-Light.

Write us for the illustrated booklet describing completely, Lalley-Light for your home.

If you desire, we will also advise the name of our nearest branch sales office who can show you this efficient plant in operation.

Lalley-Electro-Lighting Corporation  
1858 Mt. Elliott Ave., Detroit, Mich.

Rough rice, 100 lbs., 3.50@3.60 to growers at shipping points.

## HAY

Under date of January 19, Scott, Magner & Miller says:  
Receipts past week, 1465 tons. This is

about the average receipts for several weeks past. As a large portion of this has been brought in upon government requisitions and as nearly all of these orders have been filled it is quite natural that the receipts should drop off from now on unless the car situation is easier and more cars are obtainable in the country districts for local use. Trade in the interior districts has been very good, considerable hay moving to sections that are bare of grass to feed cattle in order to keep them from starving.

A few slight showers during the week have been of great benefit to the grass as well as crops in the sections that were favored. This applies mostly to points north of San Francisco. In the southern sections and on the ranges in the same districts the feed situation is a problem.

Fancy Wheat Hay (light 5 wire bale) ..... 29.00@30.00  
No. 1 Wheat or Wheat and Oat Hay ..... 26.00@28.00  
No. 2 Wheat or Wheat and Oat Hay ..... 23.00@25.00

Oats, Red Seed ..... 3.00@3.10  
Feed ..... 2.80@2.90  
New Black ..... 3.00@3.40  
Rye, Utah ..... 4.25  
Wheat—Government prices: Common white hard, base price is \$3.50 per cental, or \$2.10 per bushel of 60 pounds delivered in terminal warehouses in bulk; soft wheat, base price 3 cents per bushel less, or \$2.08 per bushel; white club (including Sonora), \$2.06 per bushel. If wheat, after cleaning, weighs 60 pounds or more to bushel, base price stands; if 58 to 60 pounds to bushel, 3 cents per bushel reduction; if 56 to 58 pounds, 6 cents per bushel less; if less than 56 pounds, grain becomes sample grade and sells on its merits up to within 1 cent per bushel of 56-lb. wheat. Sacked wheat 4 cents per bushel more, less tare for weight of sacks.

## FEEDSTUFFS

These prices applicable to San Francisco, with \$1.00 less at Sacramento and Stockton, are for cash at the mill in carload lots, and include sackage, with an additional rate of 50 cents per ton in less than carload lots.  
Wholesale prices per ton. Prices fixed by food administration as San Francisco price; Sacramento and Stockton \$1.00 less on carlots at mill door:  
Bran ..... 34.00@35.00

SAN FRANCISCO SULPHUR CO. 624 California St., San Francisco, Cal.

Two days' shipments of hogs from Sanford, Kings County, aggregated 30,000.

### MARKET NOTES

The bureau of markets is extending its service and issues a monthly report on stockyard receipts and information on shipments of stockers and feeders. In every one of the larger markets of the country there is material decline in receipts of hogs, for instance, during the first nine months of 1917, Chicago received 5,233,495 hogs. During the same period of 1916 the receipts were 6,216,943. Sheep show very much the same decline. Cattle on the other hand show slight increase. Kansas City receipts in 1917: Hogs, 1,697,290; while in 1916 there were 2,131,246. Feed is going up and hogs are growing less.

The president of Cuba has contracted with the government of the United States to send 2,500,000 tons of sugar to this country for distribution among the Allied nations. The price of the sugar delivered at the port of New York would be \$4.98½, while telegraphic reports say that for Southern Europe the price fixed is \$4.55 and for Northern Europe \$4.60.

The bean situation has been thoroughly discussed at Washington. Bean growers have been justly concerned as to the manner in which their beans are commandeered with price to be fixed at some later date. This not so much because of fear of unjust treatment as the fact that it has entirely unsettled the market and the beans which the government is not taking are unsaleable. The ruling preventing large buying has been an honest endeavor on the part of the government to prevent speculation and undue boosting of price, but a strong hand must be taken soon or great injury will be done to bean producers.

Canned goods which advanced strongly during the last few days of 1917 now show a more quiet situation.

Evaporated apples are selling more rapidly. Apricots are one-quarter cent higher, peaches are firm, and prunes, especially in larger sizes, have stronger values. The government is now placing long orders on 50s and 60s, and these sizes are extremely scarce.

Beet sugar has come to its own, and for the first time since its production in a large commercial way is selling at 10 cents per hundred in advance of cane. It is learned that the sugar situation along the Atlantic seaboard is not clearing up as rapidly as anticipated. It has been announced that most careful buying must be undertaken at least until March 1, which is the date set for relief.

Fresh apples in Los Angeles and San Francisco markets have not been plentiful, and price has shown indication of increase. In fact a 10 cent per box advance is noted. Potatoes are easier and a long supply is in sight. The shortage of refrigerator cars, with partial crop failure in many Eastern districts, is affecting apple situation.

The California Peach Growers on or about February 1 will make a second payment to growers of \$40 per ton on peaches of the 1917 crop delivered to this company. This payment of two cents per pound will apply on deliveries of both No. 1 and No. 2 stock; there will be no payment at this time on either Slab, Cling or Strawberry peaches, further payment on these grades being deferred to time of final settlement. This payment is not to be construed as final settlement, but merely a second payment on fruit delivered. Later in the year a statement will be rendered to each grower and full settlement made according to grades. Over \$1,000,000 will be distributed to the growers in making this payment. We feel it is an opportunity time to make this distribution, as the seasonal expenses incident to pruning, spraying, etc., are upon the growers.

Post card reports to the Los Angeles office of the bureau of markets of the United States department of agriculture, show shipments from California during the week ending January 21, approximately as follows: Apples, 4 cars; cabbage, 27; carrots, 1; cauliflower, 100; celery, 69; chili peppers, 1; dried fruits, 130; lettuce, 41; mixed fruits, 5; mixed vegetables, 56; onions, 12; potatoes, 94; raisins, 98; squash, 1; sweet potatoes, 6; turnips, 2.

### MORE FARM ADVISERS

A full quota of farm advisers will soon be appointed if the present rate of appointing continues. Both Dr. Coit in Los Angeles County and Professor Essig in Ventura County are fully installed, and now we have word of the appointment of Albert A. Jungerman for Stanislaus County, who will take the place of Farm Adviser C. M. Connor who has resigned to take up the same work in Tulare County.

Professor Essig's headquarters are at the Court House at Ventura. Professor Essig was for many years county horticultural commissioner of Ventura County and understands fully the producing conditions of the county.

Dr. Coit's assistants, or rather specialists, of which there are ultimately to be five, have not yet been appointed, although it is definitely settled that Mr. Hodgkin has been appointed and will take up the service within a short time. Meantime Dr. Coit is being assisted by Assistant Director W. D. Norton, a specialist who has been first or temporary adviser to many of the other advisers. The adviser's office will be room 357 Court House Building, Los Angeles.

The board of directors of the farm bureau met in Los Angeles last week and elected the following officers: P.

F. Cogswell, El Monte, president; Volney Craig, San Fernando, first vice president; C. A. Griffith, Azusa, second vice president; W. S. Rosecrans, Gardena, secretary; Ralph McNeils, Whittier, treasurer.

The committees appointed are: On publication of monthly bulletin, A. W. Frye, E. F. Underhill, Robert Neely; project, W. B. McQueen, J. W. Deupree, C. F. Richardson; re-districting, H. A. Miller, T. N. Barker, O. W. Mansly; grain sorghums, Donald Graham, Volney Craig, Frank Kepper; labor situation, Ralph McNeils, P. F. Gogswell, Floyd Pomeroy, C. A. Griffith.

### GRAPE STANDARDIZATION MEETING

A meeting of representatives of the shipping grape industry of Fresno and Tulare Counties was held in Fresno on January 11 for the purpose of reaching an agreement on uniform inspection between the two counties. The commissioners of Fresno, Kings, Tulare, Madera, Merced, Stanislaus and San Joaquin were present, also E. M. Sheehan, secretary of the state viticultural commission.

During the meeting it developed that the methods of inspection of table grapes in the two counties, to determine the sugar content, differed considerably. The inspection in Tulare County was considered by Tulare County packers to be more exacting than that of Fresno. All agreed that it was none too severe but asked for as strict an inspection in Fresno County.

Upon the suggestion of Mr. Hecke it was decided that a chief inspector be employed jointly by both counties, the expense being pro-rated according to the time spent in each county. This method was considered to be the most satisfactory solution of the difficulty because of the absolute necessity under the existing conditions of the adoption of uniform methods.

### YOUR OPPORTUNITY

The price catalogue of California fruits issued by Silva Bergholdt Company Newcastle, is headed "Your Opportunity for Pure Food Conservation." Of course the major part of the catalogue has to do with illustrations of profit making fruit trees which are grown by this great concern. The catalogue is illustrated with photos of fruits and of trees, and with it is given a fund of planting and cultural information.

## WHEN PRICES ARE HIGH and LABOR IS SHORT

the farmer **MUST** save time and effort, not only in producing, but in hauling. The larger the load and the faster the trip to market, the greater the profit.

Good roads have always helped the farmer. Now they are indispensable. Farm labor is scarce. Wages are high. Every hour wasted on the highway cuts down output and eats a hole in profits.

What the farmer needs is not a patch of hard road here and there, but a connected system of hard roads putting him in easy reach of his markets. And to get the best prices he needs roads that stay good 365 days a year.

There is no reason why farming communities should not have perfect systems of permanent highways. It is entirely up to them. The roads can be built in two or three seasons. When the cost is spread over fifteen or twenty years the annual tax for both interest and principal is only a few cents per acre. In Vermilion County, Illinois, for example, a magnificent concrete system is being built and the annual tax is only about 8c per acre per year, for 20 years, which covers the interest and gradually pays off the debt.

The farmer should act now in getting road plans under way to further his own interests. Systems of permanent highways benefit everyone, but to the farmer they are *indispensable*.

# REO

"THE GOLD STANDARD  
OF VALUES"

## This New Reo Light Four Is a Handsome Motor Car

AT THE NEW YORK SHOW, in January, the Reo exhibit was, to an even greater extent than ordinarily, the mecca of the crowds.

YOU'D THINK, PERHAPS, that at the National automobile show, and especially in the world's greatest metropolis, where dealers and buyers go to see what is latest in construction and design, that the ponderous multi-cylinder machines would attract the most attention.

ON THE CONTRARY, there was vastly more interest shown in the types of cars that are designed to supply that great American need for a practical, economical, five-passenger touring car or three-passenger roadster.

THIS YEAR, more than ever before, buyers are paying less attention to fads and more to practical things. More to cost of up-keep than to first cost.

AND THIS REO—this new Light Four—stood out above all the rest.

IT IS SUCCESSOR to the greatest four-cylinder automobile ever built—that wonderfully efficient, wonderfully sturdy Reo the Fifth, that for eight years maintained its supremacy.

THIS IS A REFINEMENT of that great car. All fundamentals have been retained and every detail has been refined to the last degree.

IN A WORD, this latest Reo represents all that has gone before and just that much more of Reo experience.

THIS IS A REAL CAR—a full five-passenger Light four. Not a skimpy—not a little four.

IT DOES SEAT FIVE full grown adults—you don't have to use a shoe horn to get them in.

BODY DESIGN IS BEAUTIFUL—it is up to the minute in every line and curve and in every detail of upholstery and finish and appointments.

IT IS JUST THE CAR you would specify if having one made to your own order.

FOR HERE ARE COMBINED roominess with economy of operation; beauty in appearance with sterling mechanical quality;

AND LOW UPKEEP—that quality for which Reos have always been famous.

OUTPUT IS LIMITED—must be this year, for we also are doing our part to assist Uncle Sam.

SO YOU'LL HAVE TO HURRY. Make your decision—see your Reo dealer and place your order well in advance of the time you will want delivery, else you will surely be disappointed.

TODAY—won't be a minute to soon.

**Reo Motor Car Company, Lansing, Michigan**

## Power on the Farm Then and Now

Interesting Bit of Information as to Walking Type of Tractor or Steam Plow of the 60's. Presumably It Would Not be Arrested for Exceeding Speed Limits

EVER was there a time in the history of agriculture when there was more interest in labor saving appliances in general and in plowing and soil fitting appliances in particular. We look at

our gas tractors pulling the gangs of plows and wonder how our forefathers ever grew enough to eat with the crooked stick plow or even later with the best appliances at hand. But while we feel we are blessed in these modern appliances far above the farmers of 50 and 60 years ago, their ambitions were apparently as great as ours today. In an agricultural report of the year '69, we note "There is no object of more interest in Washington than the United States Patent office, the receptacle of all silent or eloquent memorials of the genius and efforts of our inventors, and there is no department of this vast institution more pleasing to the general visitor than that devoted to agriculture." Then, as a bit of general information, a table showing a number of agricultural patents issued during the 12 months: "For bee hives and bee keepers supplies there were issued 62 patents; churns and churning, 130; corn shellers, 40; cotton gins, 30; cultivators, 150; threshing machines, 35; yokes, 15; forks, 100; harvesters and attachments, 195; hay tedders, 10; milk coolers, "safes," pails, etc., 45; seeding and sowing machines, 80; rakes, 90; planters, 150; and so on, but the greatest number was of plows and attachments for which there were 255 patents issued." The total of agricultural patents was 1900. As noted, the plow takes precedent, and it is a pleasure to show on this page a reproduction of the drawings appearing in the same book of one of those plows. In comment on these plows, however, we note: "So many magnificent theories in regard to the practicability of plowing by steam have proved fallacious when tested in practice that inventors appear to rank notions of that character among the utterly impracticable, and consequently to be 'let alone.' The hauling system, by which is to be understood the mode adopted by Fowler, who employs a stationary engine to draw a plow across the field by means of a long rope or chain, which winds around a drum or pulley, has been fully and satisfactorily tested in England, but had not been extensively introduced into this country. We need the steam plow, however; there is no spot in the world so well adapted to plowing on a large scale as the broad prairies of the West. Nowhere is there a finer field for the display of an effective machine; namely, level ground, loose soil, and all the accessories to render success certain and complete." Again: It is worthy of note that the patents granted on wheel plows in 1869 to residents of California and Oregon largely exceeded in number those granted for inventions of a like character from all the other states of the Union."

### INCOME TAX

Less than four weeks remain for filing individual income tax returns for calendar year 1917. If an unmarried person with income of \$1000 or more and married person, living with husband or wife, with income of \$2000 or more (or combined income of husband and wife) fails to file this return, penalty up to \$1000 and imprisonment may be incurred. Bear in mind that if the income in either of these cases is \$1000 or \$2000, while there would be no income tax to pay, the return must be filed. There are only three offices in the state at which the payments are to be made; San Francisco, Sacramento and Los Angeles. Los Angeles County alone will have nearly 40,000 income tax payers. The rush at the last moment will be great. File your return today.

Tax payers at a distance should write at once for the blank form to Office of Internal Revenue Collector, Sacramento, Federal Building, San Francisco, or Federal Building, Los Angeles, whichever is nearest. If income is under \$4000 ask for Form 1040 A; if over \$4000 ask for Form 1040. The shorter form, 1040 A, which most of us will use, is of four pages. The first two are filled with explicit explanations; the other two have blanks for filling in. After all figures as to the income are entered up go before a notary, acknowledge and mail. Those within reach of one of the three revenue collectors may present their returns in person, making oath before the collector, or, still better, see representatives of the department who are visiting all sections of the state and giving information as to filing in the returns and who are qualified to administer the oath.

One may enclose check, money order or draft, for the amount of the tax, with deduction at the rate of three per cent per annum, for the time intervening between payment and June 15.

Of the 255 patents issued for plows, but five were for steam plows. From the description of the one we have used in the illustration, we quote:

The patent of Townley and Freidrich consists of a frame, beneath which is placed a gang of plows of the ordinary construction. This frame is sustained by broad rollers, and the propul-

sion is accomplished on the principle embodied in the "walking dolls," which were a great curiosity a few years since. A series of "spring feet" are provided, extending across the whole width of the machine. These feet are attached to longitudinal bars at each end with collars fitting over eccentrics in such a way that as the

A Tractor of Yesterday

Today we have our big wheelers, sieve grips, various track layers, among which is the Caterpillar. In the beginnings of steam plows they tried another type of traction. The above is an illustration taken from the Yearbook of 1865 of the Townley & Friedrich Steam Plow, patented April 27, 1869. Description is given in text herewith, but be sure and note the manner of propulsion. Moderns would probably call this the "Centipede" for it is propelled by a series of "spring feet" operated by eccentrics which would give a genuine walking motion.

Classy Work

In contrast with the walking doll type of steam plow, here is a graphic illustration of modern gas engine efficiency.

shafts to which the eccentrics are attached revolve the feet are brought in contact with the ground and the frame is moved forward. The eccentrics are arranged in a such manner that half of the number of longitudinal bars are moving upward while the other half are moving downward; and thus, while some of the feet are on the ground and pushing the machine forward, others are moving to a more advanced position to be similarly operated, thereby keeping up a continual forward motion of the machine.

The last invention to which reference will be made under the head of steam plows is that of Augustin L. Taveau, which was entered for patent in 1869, although the patent will bear the date of 1870. This plow belongs to that class in which the machine traverses the field and accomplishes the turning over of the soil simultaneously. It may also be used as a stationary engine working on the Fowler principle, or the locomotive may be run across the field and anchored securely and the plows drawn up to it. It is claimed, however, that the traction has been so effectively overcome that the machine may be worked in ordinary soils in the manner first suggested. The main point in this connection is the construction of the traction wheels, which are two in number, made broad, and provided with teeth of a peculiar construction, being beveled on the rear side, by which it is believed they will not only "bite" the soil forcibly but will leave it readily. These wheels are each provided with a circular disk having a sharp cutting edge, designed to serve the purpose of a colter to the plows, and by which means it is believed by the inventor something like 55 per cent of the traction power of the plows will be overcome. In the rear of the engine is placed the plow frame, on which is arranged a gang of plows constructed to be readily raised and lowered. The standards of the plows are pivoted and provided with brittle pins so that on meeting obstructions the plow will swing back and up and thus obviate serious damage by breaking or stopping the machine. The plow frame is wheeled and the plows are made without soles, by which means it is believed that bottom friction will be nearly or altogether done away with. In the rear of the plows is arranged, if desired, a modified form of a harrow, which is provided with suitable seed and manure sowing devices. It is intended thus to effect in one passage over the field the several operations of plowing, harrowing, manuring, seeding and covering; or the plow and harrow may be run over without the seed-sowing devices being brought into operation. For the second trip the plow frame may be detached and the seed sown and covered by the harrow. The engine may be converted into a hand roller or road locomotive by covering the wheels in such a manner that they make but one large cylinder, and suitable pulleys are attached for driving any kind of farm or other machinery.

## GIANT FARM POWDERS

STUMPING — AGRICULTURAL

Uniformity is another word for economy and safety. When the same things happen with each pound of Giant Farm Powder, you know not only how much to use, but what results to expect and how to handle the explosive.

Giant Farm Powders are surer, safer and more economical because our tests guarantee every pound. We maintain our own completely equipped chemical division to inspect Giant Farm Powders during every process of manufacture. Absolute uniformity means absolute dependability. Like results always obtained under like conditions make western farmers prefer Giant Farm Powders.

"Giant Powder is the most satisfactory," says John Zurr, Santa Rosa, Cal.  
"I account for this because Giant Powder is made with the utmost care."

**Caution:** Be sure you get the genuine. That other explosives are often called "Giant Powder" indicates the high quality of the original. Look for the Giant trade-mark on every case.

The coupon (or a postal mentioning this paper) will bring you the big book "Better Farming." Tells how to remove stumps, prepare tree beds, and do all kinds of farm work cheaper and better. Write for it now.

## Light Crop of Oranges

Estimates Show That Total Orange and Lemon Output for State Will Probably Be Less Than 25,000 Cars.

**T**HE Riverside Press has for years made careful estimate of the orange and lemon output early in each January. Many of the oranges of the state are already shipped so that it affords opportunity for fairly accurate estimate for the 12 months' output. The total for the state for the year ending on November 1 next is to be—estimates being correct—17,300 cars oranges and 5,680 lemons. By districts according to Press' figures:

	Cars Oranges	Cars Lemons
Orange district .....	2200	600
Azusa-Glendora district .....	2000	225
Pomona district .....	1325	200
Covina .....	1000	.....
Placentia .....	900	25
Redlands district .....	850	.....
Ontario district .....	780	500
Riverside district .....	750	175
San Dimas district .....	700	450
Whittier district .....	700	650
Ventura County .....	600	1300
Anaheim .....	600	.....
Fullerton .....	600	.....
Rialto-Bloomington- Colton .....	500	20
Duarte-Monrovia .....	400	.....
Highland .....	300	50
Corona .....	275	400
Alhambra-Pasadena .....	250	.....
San Diego County .....	130	625
San Fernando .....	90	10
Santa Barbara County .....	.....	350
Hemet .....	40	.....
Moreno .....	20	.....
Other localities .....	90	.....

Total for So. Cal. ....15,100 5580  
Central California .... 2000 100  
Northern California .... 200 .....

Total for state .....17,300 5680

For Riverside the estimate is made by Manager Lynn of the A. H. Fruit Company:

"We estimate the crop of navels in the Riverside district, including Highgrove, Arlington Heights and West Riverside sections, to be ten per cent of a normal crop; Valencias and other varieties about 65 per cent and lemons about 40 per cent. Our estimate for the district is about 850 cars of oranges and 160 to 175 cars of lemons on the basis of 400 packed boxes to the car. Sizes on the Navels will run quite heavy to 126s and larger; indications are that the other varieties will run heavy to medium sizes."

Mr. Matthews of Covina Argus gives through the Press the following summary for the state:

"The cheerful philosophy that 'a short horse is soon curried,' applies with gentle force to the Southern California Washington Navel crop this year, traced in cause to the heat wave of last summer.

"I have a very poor opinion of crop estimates, however, as many years of printing these estimates coming from the wisdom of others has left me with the knowledge that the human mind is frail in this respect. The citrus crop is almost invariably under-estimated.

"The rancher is the reverse in procedure to the man who runs a mercantile house. The merchant must at all times claim that business is good (at

least in any public statement). It's good for business to claim that business is good. That's why we build up chamber of commerce propaganda, and that's why merchants roll up a sentiment of cheerfulness and optimism in their advertising, if they are clever merchants. But the rancher's business is not directly injured by a little pessimism. In fact he has been taught to believe that if he represents his crop to be small the price will be higher, which is something that used to be a fact, but of late years has no effect on the market. Produce dealers no longer pay any attention to field estimates, except in cases of almost total crop failure or unprecedented surplus of crops. The market is not influenced until the cars are arriving within a few miles of market. The amount of fruit rolling at a particular time is the only estimate that the Eastern market cares much about.

"But if a rancher has more fruit than he estimated, it does not hurt him. He can talk pessimism and get away with it, and do it again the next year. His pessimism hurts the general business of his community, has a tendency to stop new construction, and puts excessive caution into the country merchant. Time and time again the estimates gathered on the citrus crop have been proved very wide of the mark and invariably erring on the side of pessimism.

"The hot wave of last summer wiped out a huge amount of fruit that was forming. I recently made a trip through Porterville and Lindsay. They put the fruit through in short order this year, having but about 30 per cent of a normal crop. But last summer they said that they were going to find scarcely a mature orange when picking time came.

"Los Angeles County has a very light crop of Navels. The prevailing pessimism is to the effect that there will not be more than 15 to 20 per cent of a crop, but, without looking at a single tree or orchard, it is safe to say that there will be much more than this amount. Already some of the ranchers are beginning to brighten up and to say that they have more fruit than they thought they had, which has a strangely familiar sound to me.

"The citrus situation in Covina, Whittier, Azusa, Glendora and through the central Los Angeles County belt is very good, although the Navel crop is very light. This is getting to be a 50-50 Navel and Valencia country. The old Navels are gradually being replaced with Valencias. There is every reason to believe that there will be a good Valencia crop next summer, although not such a huge crop as has been harvested in the last few years. The greatest amount of fruit and the largest cash return of any year in the history of the industry was the result of last year's citrus crop in Los Angeles County.

"Because a horse can trot a mile in 2:04, it's no sign that he should be expected to trot two miles in 4:08. Two years in the citrus industry are never alike. The Irish hod carrier said when he fell seven stories from the scaffolding that he had to come down for more bricks anyhow. And perhaps, on account of the great traffic congestion, it will be a blessing that we have fewer oranges this year."

## June Drop

**T**HE state university is now mailing to citrus growers Bulletin No. 290, "The June Drop of Washington Navel Oranges," a progress report by Dr. J. Eliot Coit and Robert W. Hodgson. This report is a chronicle of investigations conducted during several years, in which a portion at least of the June drop is ascertained to be due to alternaria citri. The report says:

The fact that a fungus has been

found connected with certain phases of the drop phenomenon has led some growers to anticipate that spraying with fungicides might prove an effective means of control. Unfortunately neither winter spraying nor spraying in the bloom has proved effective. Inasmuch as our investigations have discovered the reasons for the failure of sprays and have indicated in a general way the lines along which efforts for prevention or control must be directed, a report seems warranted at this time.

The shedding of the young Navel or-

# Boost Your Citrus Trees

Why not buy your farm munitions ready for use, not subject to the losses which the other Nitrogens always suffer? Commercial sense dictates that money is saved by use of Nitrate, for its comparative low price strongly commends it to the business grower.

## Budded Avocados

of varieties endorsed by the Avocado Association; especially the FUERTE, best of all. May we quote you prices?

West India Gardens,

F. O. Popenoe, Mgr., Altadena, Calif.

anges has been ascribed to various causes among which are irregular or deficient irrigation, cold irrigation water, irregular fertilization, injury due to thrips, fungus parasites, and climatic conditions. A somewhat comprehensive preliminary study of the situation with extended observations in the field very soon eliminated all but the last two possibilities. Therefore attention was early directed toward attempts to isolate fungi from the stigmas of the young flowers and from the navel ends of the small fruits.

Summarizing the matter in the report the authors say:

June drop of Washington Navel oranges causes an annual loss of \$1,225,000 to \$1,750,000 in California and is the limiting factor in profitable Navel orange production in many parts of the interior valleys of California and Arizona. The drop itself can be separated into two parts, that occurring from petal fall until the fruit is about an inch in diameter, and that occurring after that time. The first part is much the more serious and is due to abnormal water relations which serve as a stimulus to abscission. The second part is less important and is due to the fungus *Alternaria citri* of wide distribution which is also the cause of black rot of Navel oranges. The fruits showing the black rot represent those infected fruits which managed to survive to maturity, other infected fruits having fallen, chiefly during the months of July and August.

The water-relations drop bears a definite relation to climatic conditions and all efforts looking toward prevention or control must be either in the nature of modifying environmental conditions, or in selection for dry-heat-resistant strains. Of these two the former seems to promise the more immediate results.

### ABOUT THE AVOCADO

A free correspondence course on the avocado is announced by L. J. Condit of the state university. He writes that lessons will be given in the following topics:

Economic considerations: Acreage; prices for budwood, seeds, trees, fruit, etc.; financial problems and probable returns; the California Avocado Association. History and Geography in Other Countries: This takes up the consideration of the success of the industry in such countries as Mexico, South America, Hawaii, Philippine Islands, Porto Rico, Florida, Cuba. History and Distribution in California: This gives the early history in this state; the men who have been influential in getting the industry started; an account of some of the old seedling trees in various parts of the state; some of the orchards which have already been developed. Soil, Climatic, and Moisture Requirements: This lesson treats in detail of the experience which has been learned in regard to favorable and unfavorable soils, both in California and Florida; the effect of heat and cold on the trees; the experience gained in the hardiness of different varieties in California; the effect of wind. Botany, Common Names, and a Description of the Plant. This considers a thorough description of the plant, including the roots and wood, habits of growth, leaves, flowers, fruits, seeds, etc. Propagation and Methods of Propagation which secure the best results. Planting and orchard management. This includes the spacing of the trees, tree protection, planting, irrigation, mulching, fertilization, pruning, top

## The biggest crop-producer a fruit-grower ever used

They enable you to do thorough, rapid cultivation, save time, labor, money, and increase the food supply.

### No. 8 Horse

Hoe does a greater variety of work in corn, potatoes, and other crops requiring similar cultivation, and does it more thoroughly than any other one-horse cultivator made. It is stronger, better made and finished. Lasts longer. Its depth regulator and extra long frame make it steady-running. Cultivates deep or shallow and different widths of rows.

**No. 41 Orchard Cultivator** does such thorough work in orchard, vineyard or hopyard that bigger and better crops invariably follow. Exceptionally light draft adds to the ease and rapidity of cultivation. The strong frame carries teeth sweeps, irrigating steels, plows, alfalfa teeth and special weeders. Has tree-shield, side-hitch for low trees, and fore-carriage if wanted. Works deep or shallow, and cuts 4 to 6 1/2 ft. wide.

No. 41

We carry stock in Los Angeles. Agents in all principal Pacific Coast cities.

working, thinning the fruit, intercrops and cover crops. Classification and Varieties: This includes a thorough discussion of the requirements of a commercial variety and the basis of the classification of the Mexican, Gatemalan and West Indian types. Harvesting, Picking, Marketing, and

Pests. A discussion is given of the season of maturing, picking and packing the fruit, shipping, cold storage, insect pests, diseases. Food Value; Uses; Analyses; By-Products. The results of investigations by various chemists and students; the uses of the fruit; the by-products, such as avocado oil, paste, etc.

## Prolongation of Bearing of Muscat Vines with Decayed Crowns

By A. E. Way in Sun-Maid Herald

**A**NY methods that might be adopted to renew the bearing qualities of a Muscat vine that has a decayed crown or trunk cannot be permanent. The injury is there and will always remain; but it is possible to prolong the life of the vine and get back its vigor or growth and bearing qualities for perhaps ten years. A good method consists of taking water-sprouts or suckers and either tying them together over the old crown or to a three-foot stake driven as close as possible to the trunk.

Tying to a three-foot stake is preferable, as it will keep the canes from sagging down and getting misshapen. It will also keep the canes in a vertical position and thereby increase the vigor of the shoots at the ends of the canes, where the future crown is to be. The growth on a decayed vine, as a rule, is very small, both in size and length.

If the grower has done his spring suckering thoroughly, there are no suckers; therefore, methods must be used to promote sucker growth. The best method is to prune the vine to one bud on each spur and decrease the number of spurs on the old crown. This will force out a lot of water-sprouts and suckers in the spring, besides enabling the shoots, from these one-bud spurs, to produce large bunches and berries instead of a lot of worthless small grapes lacking sugar.

In a great many cases it is advisable to open the crown of the vine with a small axe, exposing the rotting pulpy mass to the sun and drying winds, which will retard the further decaying of the outer living shell of the trunk. A handful or two of slaked lime thrown into the opening made helps to heal the decaying surface of the wound. The water-sprouts and suckers grow more vigorously where all this is done.

The canes that are tied up should be about two feet long—not longer—and from one to four canes should be taken up. Where the vine has produced only one cane or is too weak to support any more, that one should be used.

The three or four canes should be tied at equal distances all around the trunk where possible, but never take up two canes that start out close together.

These canes are to be left permanently—they will form the future arms or trunks of the new vine. It is sometimes necessary the following winter to prune off a cane or two of those that were tied up if the growth has not been strong enough.

The cane can be pruned off close to the trunk if there is another adjoining to take its place, or pruned back to one or two buds and so start fresh canes.

These canes will bear some fruit the first year, but if the water-sprouts and suckers are pruned to one or two buds the first year, then the shoots or canes from them will be fruit-bearing canes, and when they are tied up the crop will be greater.

Being tied up vertically, the shoots at the top will be the strongest and the following winter one to two of these top shoots should be pruned to two buds and all lower growth on the new arms or trunks should be pruned off, and, in the spring, suckered. If all four arms are growing satisfactorily, all sucker growth on the old trunk should be removed; otherwise, they will be robbing the new trunks of sap.

The spurs on the new trunks are increased every year, according to the vigor of the vine.

Vines so treated have re-established themselves and are bearing good crops, but not without some aid from a nitrogenous fertilizer and thorough cultural methods. This method will not re-establish a Muscat vineyard in one year, as some of the vines have no water-sprouts or suckers growing and will have to be forced to produce them. To be successful, careful suckering of the old stump and crown should be practiced every spring and summer in order to force the growth and vigor into the new head and spurs. It will be a decided help to very low crown vines that need to be raised higher in a short time. It is absolutely useless where there are any forms of root diseases.

## Tractor School

Subscribers have written asking as to the tractor school at Riverside and the requirements of those wishing to receive instruction. We have the following from Professor Vaile:

Replying to your inquiry, relative to our tractor short course, I would say that it will be necessary for people who take this course to live in town during the course. The Y. M. C. A. has agreed to assist in any way possible in obtaining rooms for men applicants and the Y. W. C. A. for the women. Rooming and boarding houses are available at popular prices, as is the case in any similar town. Box lunches will doubtless be the desir-

able way of handling the noon meal. These can be procured at any of the several places in town.

"Some sort of bus connections will be maintained. The exact nature of this will depend upon the number of students. We have at the present time something over 50 applicants, some of which doubtless will not materialize.

"The only thing necessary in the way of books and stationery will be a note book and a sharp pencil.

"Coveralls, or something equally suitable, are recommended as the most appropriate dress.

## ARSENICALS FOR SPRAYING APPLES

**S**AFETY and cost are the important considerations in purchasing spraying materials. Prevailing high prices make cost doubly important this year. Most arsenicals are effective. Some are likely to cause injury. The most serious injury is a blackening of the blossom end of the apple, commonly termed the calyx burn.

Calyx burn is induced during the application of the calyx spray, though it usually is not noticeable until the fruit begins to approach maturity. The direct cause may be unsuitable arsenicals, mishandling of materials, or over-heavy spraying.

Arsenate of lead is made in two chemical forms, neutral and acid. The acid form is the usual commercial or standard arsenate of lead. The two forms differ in the amount of arsenic that is in combination with the lead. The neutral form contains less arsenic, is more expensive to make, and sells for a cent or two more per pound than the regular commercial product.

The neutral form is more stable and less affected by general atmospheric agencies than the acid form, consequently it is less likely to cause injury. It is the safest to use on peaches and other tender plants, and should be used on varieties of apples susceptible to a serious calyx burn. The neutral product is sold by different manufacturers as neutral arsenate of lead, ortho arsenate of lead, or some other name which designates the chemical nature.

Varieties of apples vary in susceptibility to arsenic injury. Ingram and Missouri Pippin are most severely injured. Jonathan and Ben Davis follow in the order of susceptibility to calyx burn, but usually are not so seriously injured.

During the season of 1917 Ingram and Missouri Pippin trees sprayed with a neutral arsenate of lead were practically free from calyx burn, while on trees of the same varieties, sprayed with the regular standard product, the injury ranged from about fifty to nearly one hundred per cent. Much of this injury was severe enough to materially increase the number of culls.

Arsenate of lime is a less expensive product than arsenate of lead. In combination with lime-sulphur it is just as effective in the control of orchard pests as is arsenate of lead, according to F. W. Faurot of the University of Missouri college of agriculture. With it there also appears to be less tendency for the substances of which the combined spray is composed to break down through chemical action than when arsenate of lead is used. Arsenate of lime, however, either alone or in combination sprays has somewhat greater tendency to produce injury than arsenate of lead. Yet, if good product is obtained, it may be safely used on apples, particularly on those varieties which are not specially subject to calyx burn. Arsenate of lime is also one of the cheapest and most satisfactory arsenicals to use for spraying potatoes.

### CREDIT WHERE DUE

The Sun-Maid Herald, referring to W. R. Nutting's connection with the Associated and also with a large concern not affiliated, explains that Mr. Nutting is in no way antagonizing the plans of the Associated. The editor of the Herald says: "If it should come to a sharp conflict his allegiance would be—as it always has been—with the Associated as representing the prosperity of all the growers of the community. W. R. Nutting started the movement that led to the organization of the California Associated Raisin Company, and since that time he has always been working for the success of the Associated. His loyalty has never been questioned by any one in the Associated who knows the facts."

# What would the oil in your engine show?

**F**OR years, both motorists and engineers were in the dark as to the amount of friction and consequent wear due to the sediment formed in the average motor oil.

Inferior oil breaks down under the terrific heat of an automobile farm tractor or stationary engine and forms voluminous black sediment. This sediment causes rapid wear of the parts because it crowds out good oil at points where friction occurs.

## How a lubricant muzzles the tiny teeth of friction

If you could look at the surface of a bearing or other engine part through a powerful magnifying glass, what would you see?

Not a smooth, even surface, but thousands of microscopic teeth. Sediment excludes the protective film of the oil and allows these tiny teeth to grab and tear at each other, thus causing rapid wear.

## A practical proof of superiority

The Sediment Test, illustrated at the right, is as simple as it is convincing.

The bottle to the left contains a sample of ordinary oil taken from the crankcase of an engine after 500 miles of running.

In the right-hand bottle is a sample of Veedol after being used for 500 miles under identical conditions.

Notice that ordinary oil contains over five times as much sediment as Veedol.

## Make this test for yourself

Drain the oil out of your crankcase and mix with kerosene. Run the engine very slowly for 30 seconds and then clean out all kerosene. Refill with Veedol and make a test run. You will find your engine has acquired new power and a snappy pick-up. It will run more smoothly and give greater gasoline mileage.

## Buy Veedol today

Your dealer has Veedol in stock, or can get it for you. If he will not, write us for the name of the nearest dealer who can supply you.

## An 80-page book on lubrication for 10c

Written by a prominent engineer. Used as a text book in many schools and colleges. Also contains Veedol Lubrication Chart, showing correct grade of Veedol for every make of car, tractor, or stationary engine, winter or summer. Send 10c for a copy. It may save you many dollars.

## February Vegetable Planting Calendar Southern California

Written for California Cultivator By D. F. Reichard

**F**EBRUARY is our busiest month from a planting standpoint. This year should see garden activities proceeding at highest tension and every available piece of ground occupied by tree, garden, field crop or poultry yard. For by an abnormal production of food stuffs of whatever nature the miseries existing throughout Europe will be lessened and our being brought under the food ticket system averted. It will pay even the specializing ranchers to devote a portion of their land to a vegetable garden though

months to insure a constant supply. In the case of tomatoes plant some early variety and some medium and late varieties for a continuous supply during their season. Tomatoes along with peppers and egg plant should be planted where they will not be disturbed throughout the season. The seeds of the latter three items should be planted this month to get plants for setting out a little later. Corn, melons and cucumbers can be planted in protected places. Melons and cucumbers if well cared for will need only one replanting early in July to extend their producing season well into fall, but with corn a small patch at least three rows wide should be planted every couple of weeks until the middle of August. Potatoes may be successfully planted until the first of April and then again during August. Onions should be planted in quantities now to produce dry onions for fall and winter use; for a constant supply of green onions seed should be planted monthly.

Cultivating Lettuce  
Wheel hoe with cultivating rake

If the garden is to be permanent do not overlook the perennial vegetables and small fruits; these must be planted where they will not be disturbed each season; at the edges of the plot is the preferred location for them; here they can be attended to properly and are out of the way of the short season crops where the land is cleared away every few months.

Of the items mentioned the varieties for planting this month are Extra Early and Crosby's Egyptian beet; Oxheart and Chantenay carrot; Early Purple Top turnip; any of the summer radishes; Amsterdam Giant spinach; Wonderful and Iceberg lettuce; Telephone, Stratagen or Senator peas; Canadian and Ventura Wonder beans; Cannon Ball or Scotts Cross cabbage; California Pearl cauliflower; Early Adams and Hearts Early sweet corn; Early White Spine cucumber; Rocky Ford cantaloupe and Angeleno or Chilian Black Seed watermelon; American Wonder and Triumph potatoes; any variety of onion; other things that may be planted are chicory, endive, kohlrabi, kale and swiss chard.

It is always well to have on hand hydrated or slacked lime, tobacco dust, tobacco extract, arsenate or lead or Paris green, sulphur, rosin wash or lime-sulphur solution, Bordeaux mixture and a good spray pump to keep down any attacks of insects or fungi.

Dust the lime or tobacco dust over the seed bed to keep insects away; spray the young plants with tobacco extract or with arsenate to kill insects and dust sulphur or spray with Bordeaux to prevent blight and rust. Use the rosin wash or lime-sulphur on the hard wood plants to keep them clean of scale.

### Northern California

Written for California Cultivator by A. R. Gould

**A**WIDE appeal is abroad throughout the country for a million home gardens, and if such an appeal is heeded it will certainly be productive of much good in many different ways. It will bring increased crops to add to the food supply and thus strengthen the forces against the enemy and will bring health and vigor to all those who get busy outside in

the garden. There is no more healthful occupation than using the pick and shovel. There is lots of room even in the cities for the work of reclamation. Backyards can be cleaned up and put into a state of cultivation. Vacant lots which are an eyesore to most of our cities should be put into shape where possible. There is a patriotic duty for both the town and country dweller to perform.

# JOHN DEERE SPREADER

**The SPREADER with the BEATER on the Axle**

While it always has paid to use a John Deere Spreader, this year it will make bigger profits than ever before. Extra bushels, extra tons mean extra profits this year.

The John Deere Spreader makes bigger crops possible. It enables you to fertilize more land with the same amount of manure. It spreads the manure evenly. Every foot of the ground is covered and you control the distribution to suit the soil or crop conditions. The John Deere Spreader makes top dressing practicable, which you know has proven unusually profitable. It enables you to utilize barn-yard manure economically and profitably.

The John Deere Spreader is a real time and labor saver which means much to you under existing farm labor conditions. Due to its unusual construction and extreme simplicity, it will give more years of satisfactory service at less cost per year to operate.

## Mounting the Beater on the Axle A Patented Feature Makes Possible These Distinctive Advantages:

**The beater drive is strong and durable.** It has the same principles and is as simple as a triple-gear horse power. The gears are enclosed in a dust-proof case. They run in a bath of oil. No dust or dirt can reach them.

**It is easy to load from the front to the rear.** You see where every forkful of manure goes. It is only 38" to the top of the box. A boy can load it.

**High drive wheels are used.** The draft has not been sacrificed to make an easy loading machine. Mounting the beater on the axle made this unnecessary. High drive wheels save horse flesh.

**Unusually simple—no clutches—no chains.** The simplest spreader built. Only about half the castings on it necessary on other spreaders. No clutches

or chains. All of the main working parts mounted on the rear axle—not affected by twisting strains. They can't get out of line and cause binding, heavy draft and breakage.

**It's an easy running spreader.** High drive wheels, roller bearings at both ends of the beater, ball-bearing eccentric apron drive, revolving rake and even distribution of load, all help to make the John Deere a horse saver.

**A boy can operate it.** A boy old enough to drive horses can operate the John Deere Spreader as easily as you can. Tell him where to set the feed lever and he can easily put the machine in and out of gear. That's all there is to it.

The ball-bearing eccentric apron drive, non-racing apron, revolving rake are other features which also help to increase its efficiency. A wide spread attachment and straw spreading attachment can be furnished when desired.

**John Deere, Moline, Illinois**

**-a larger yield from the same field!**

**2½ more tons to the Acre!**

Dr. T. B. Spalding of Turlock, Cal., writes: "I planted 17 pounds of Germain's hairy Peruvian to the acre and my yield brought \$90 net per acre the first year. On the second of January the alfalfa was one foot high and as green

and beautiful as if it were May. The winter does not stop your hairy Peruvian from growing. I enclose my check for which express me 350 pounds."

Germain's Hairy Peruvian has been thoroughly tried out throughout the Southwest by practical ranchers, and it has produced the greatest alfalfa tonnage known—under all climatic conditions. Does equally well at 5000 feet or at sea level. Write at once for large descriptive folder containing full information, and many testimonials by well-known growers.

### DEALERS

We have a very liberal proposition for unoccupied territory—write for further particulars.

and the Cultivator staff will be happy to act the role of instructor and is constantly preaching the gospel of food production. We are still without our usual supply of rain to date, but we doubt not that it will yet arrive, and we have had just enough to enable us to get on with our preparation. The first rains have softened the surface and made digging easier, and we must lose no time in trenching and manuring all vacant land. Have all plots put into shape and early crops sown in anticipation of the rains we expect shortly.

### Seedsmen and Seed Catalogs

Now is the time to study seedsmen and their catalogs, which are both of importance to the gardener and food producer. While we hold no brief for any particular seedsmen we would advise our readers to deal only with a reliable firm which has a reputation to uphold. Some of these may be found who advertise in the Cultivator, and although there are some who are enticed to buy cheap and unreliable seeds offered by unknown firms, we think that our readers generally are only looking for good results and therefore are prepared to buy only the best and those seeds which are tested, tried and true. Some seeds only retain their germinating powers a very short time, and it is very essential that fresh seeds be supplied. Only unreliable firms use old seeds which are worthless and are only disappointing to those who buy and use them. Seeds are tested to find out the percentage of germination and seedsmen who know their business know how each particular subject should come out under average conditions.

### Asparagus

This is the month to plant new beds and renovate old ones. Roots may be dug up from old beds, and where they have become thickly matted together they may be divided and planted 18 inches apart in rows three feet apart. A good plan is to sow seed in rows 18 inches apart, an inch apart in the rows, and it is advisable to soak the seed for 24 hours before sowing. Later the resulting plants may be thinned to three or four inches apart. Another year every other row should be transplanted to make the distance between the rows three feet apart. The third year from seed they will yield a good crop. Quicker results are of course secured by buying roots from the seedsmen. These must be planted at least four inches deep. Excellent varieties are Barr's Mammoth and Conover's Colossal.

### Brussel's Sprouts

These require a very long season of growth and the earlier you have the plants ready for planting out the better. It will be advisable to sow seed in a well prepared seed bed, broadcast or in rows. Seed should be sown sparingly. In the meantime the plot should be well manured and deeply trenched.

### Salsify

This is a vegetable which has the distinct flavor of the oyster and is now becoming very popular. It is the long root which is used and it may be served up in various ways. It grows best in a fairly sandy soil which should be richly manured. It matures from seed in about five or six months. The seed should be sown in rows 12 to 15 inches apart and the plants thinned out later to three inches apart. Mammoth Sandwich Island is the best variety.

and make up a mixture of fine garden soil and leaf soil with a little sand added. Sow seed of Dobbie's Champion. A packet will supply many plants.

### Parsley

This is useful for garnishing and should be grown in rows. Sow the seed in rows one foot apart and thin out the plants later to nine inches apart. It requires a fairly rich soil. The best varieties are Champion Moss Curled and Double Curled. It makes a fine edging if sown around the garden plots.

### Peas

The main crop of peas should now be sown, and such varieties as Abundance, a popular canning variety and only 1½ feet high. Senator, a very prolific pea, well filled pods, matures in 60 days. It grows 2½ to three feet high, hence will need wire supports. Stratagem, another semi-dwarf variety. All are excellent and will provide you with a continuous supply. Those varieties which need support should be grown against a few wires stretched across stout posts placed 12 feet apart, and it is better to sow them in rows three feet apart, allowing more space than the dwarf varieties which may be placed 12 to 18

inches apart. You will require one pound of seed to a row of 100 feet. See that the crop never suffers through lack of water.

### Beets

Make a sowing of Extra Early Egyptian, an excellent table beet, and Detroit Dark Red, a fine globe shaped variety. The soil should be rich and of a friable nature, and once the seedlings are up they should be thinned out to about four inches apart in the rows and never allowed to get dry. Encourage a steady growth if you would have tender beets. Sow the seed thinly.

### Onions

Late varieties or main crop may still be sown, and Ailsa Craig, Prizetaker and Australian Brown are all good keepers and should prove useful next winter. Sow a large area and thin out and extend it by using the plants you get from the thinning process. Brown onion sets may still be secured for planting and will furnish you with earlier bulbs. Cultivate between the rows of those earlier sown.

### Radish

Sow Early Scarlet Globe and French Breakfast broadcast or in rows thinly in fairly rich soil and keep well supplied with water.

## Ornamental Garden for February Northern California

Written for California Cultivator by A. R. Gould

WE HAVE been somewhat delayed in our planting owing to the fact that our usual supply of rain has not been forthcoming. However, we have been able to clean up and do most of the digging and lining out in preparation for tree and shrub planting, and various changes have been made in parts of the garden. Roses should have been pruned and mulched, old ones destroyed and the beds replaced by new stock.

### Roses

Now is the time to attend to the final work on the roses. New varieties are on the market, such as Los Angeles, a wonderful rose; Kitchen of Khartum, one of the latest; Isobel, a very fine single rose with immense flowers; Molly Bligh, of wonderful shape, and Margaret Dickson Hamill, a very profuse delicate rose. All these are gems and should find a place in your garden this spring. Improvement is still going on among the roses, and by having the latest you will get something choice.

### Hedges

Every opportunity should be taken to get all the hedges trimmed, and where there happens to be any dead plants these may be replaced. If you intend planting a new hedge the native California Cherry, *Prunus ilicifolia*, makes one of the best subjects for this purpose. It always looks green and hardy. The pittosporums were used quite extensively but have of late been attacked by scale severely, and this has resulted in the loss of some fine trees. The Monterey cypress makes an excellent wind or dust break and may be trimmed to almost any shape desired. For a low edging plant box, the dwarf variety, it makes a fine permanent edging.

### Some Choice Conifers

One of the most beautiful of conifers the writer has seen for a long time is "*Cedrus Deodara pendula*," the weeping Himalayan cedar. As a center specimen or placed on a lawn this

is certainly very attractive. A grouping of such cedars as *C. Atlantica*, *C. Atlantica Glauca*, *C. Deodara* and *C. Libani* is a sight to behold and make worthy specimens for any good sized garden. The silver firs, *Abies*, *Pin-sapo*, *A. grandis*, *A. lasiocarpa* and *A. cephalonica* are distinguished by their upright cones and are beautiful trees. They all make large specimens.

### A Few Select Flowering Shrubs

Among the best of flowering shrubs we would advise planting *spiraea prunifolia*, *S. japonica*, *S. argenta*, yellow Spanish broom, which flowers throughout the summer. The lilacs and syringa should be planted this spring. Among the veronicas we have very valuable material for grouping, and the best are *V. traversii*, *V. speciosa* and *V. andersoni*. The daphnes are very fragrant, and some of the best are *D. nezereum* and *D. cneorum*. The heathers, or ericas, are also very attractive, and if placed en masse are beautiful. Of these the best are *E. arborea*, *E. carnea* and *E. Mediter-ranea*.

### Sweet Peas

Trench deeply and sow the summer flowering Spencer types: Royal Purple, Dobbies Cream, King White, Florence Morse Spencer, Asta Ohn, George Herbert and Scintillator. They require well manured ground and plenty of water. Do not sow the seed too thick, and soak 24 hours before sowing. Thin out the seedlings to three inches apart later on.

### NO TIME FOR A LOAF

Some time ago, when a local corps was reviewed by Sir Ian Hamilton, one officer was mounted on a horse that had previously distinguished itself in a bakery business. Somebody recognized the horse and shouted, "Baker!" The horse promptly stopped dead and nothing could urge it on.

The situation was getting painful when the officer was struck with a brilliant idea and remarked, "Not today, thank you." The procession then moved on.—Weekly Telegraph.

## Speed up with Electric Power

*"Production and Not Acreage is the Measure of Profit"*

**H**ERE are some of the ways in which modern industry has been speeded up by putting electric power to work in the right place.

Metal mines have boosted output to meet world-wide demands. Great central power plants in place of small local plants in coal mining areas now supply cheaper electric power per ton output for each mine. All tonnage records have been smashed in the steel industry. Greater automobile output has lowered prices and given better road transportation.

More and better cloth has been produced at lower power costs.

Through the use of electric motors many farmers are also securing the high production obtained in the big manufacturing industries.

Over 200,000 H.P. in G-E motors is now at work in this way on the Pacific coast.

2500 G-E Motor Agents throughout the country are ready to help you reap the benefits of doing your work the electrical way.

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

## The Government Sells Nitrate to Farmers

The Secretary of Agriculture announces the plan for the sale and distribution of the 100,000 tons of nitrate of soda for fertilizer use, purchased under the provision in the food control act which authorizes the president to secure nitrate of soda and to supply it to farmers for cash. A circular in which the plan is fully set forth is being mailed to the country agents who will receive orders for the nitrate and transmit them to Washington.

The f. o. b. price at ports will be \$75.50 a ton, farmers paying the freight charges from the port of arrival and the state fertilizer tag fee. The plan is that county agents will associate with themselves three or more local business men in each community, who will serve without compensation, to assist them in the sale of the nitrate. In each county where there is no county agricultural agent a committee of three or more local business men will be appointed. A farmer living in such a county who desires to make application for nitrate of soda should, if he does not know the address of the local committee, address an inquiry to the state director of extension for his state. The post office address of the director of extension in each state is given in the circular. The ships carrying the nitrate will be directed to the most convenient ports, including Charleston, Wilmington, Savannah, Norfolk and Baltimore. Representatives, who also

will serve without compensation, have been or will be selected to handle the shipments at these places.

Farmers will make application for nitrate upon blanks furnished by the county agents or the local committees. Applications must be signed and returned so as to reach the county agents or members of the local committees by February 4. As the nitrate, under the law, can be sold only for cash, the farmer will be required to deposit the money covering the cost of the nitrate he wishes with the local bank, association or individual to be designated by the department. The orders will be transmitted to the department, accompanied by the amount covering the same. If the quantity of nitrate that can be secured will fill all orders, each farmer will secure the amount he requests; otherwise it will be necessary to allot the nitrate to those applying for it so that all may participate on equal terms in its distribution. None of the nitrate will be sold to dealers, either directly or indirectly. It will be sold only to farmers directly for cash, and generally not in excess of the amounts used by them heretofore.

The government is making every effort to reach farmers who desire a part of this nitrate, but states that it will be impossible for the county agents or other persons to visit every individual farmer, and urges all who desire to purchase nitrate to get in touch with their local county agent or a member of their local committee.

## Get Rid of Squirrels Now

Timely in the present anti-squirrel campaign is the following from State Horticultural Commissioner Hecke as to methods of eradication during wet weather:

### Suffocation in the Burrow

By filling the colony or village with water. This has been proven to be a most effective method and should be used wherever local conditions will permit.

Poisonous gases (carbon bisulphide or Kilmol).

### Pump Method

Use two ounces or two full measures of the gauge for each squirrel hole. Insert the hose into the burrow to the depth of at least one foot. Give 30 strokes to the pump, which will place about 12 cubic feet of 1.5 per cent carbon bisulphid or Kilmol vapor into the burrow. Remove hose and tightly close burrow with earth.

The pump method, according to the state board of health, is between 95 and 100 per cent efficient. It is a method largely used by the state board of health in plague control.

### Waste Ball Methods

The most effective waste ball is about two inches in diameter and will hold about two ounces of carbon bisulphide. Place a number of waste balls in a covered box and pour in enough carbon bisulphide to completely cover them. Place one of the saturated waste balls in each burrow, shoving as far down as possible. Allow about two minutes for the gas to permeate the burrow and then ignite each burrow with a torch or match. Take care that you do not stand over the burrow as the explosion may blow in your face. Then tightly close all ignited burrows with earth, using care not to bury the burning waste ball.

### Another Effective Method

Procure a stick about three feet in length, such as a broom handle, and wire to this an ordinary tin can of about one pint capacity. The can should be wired to the stick about six inches from the upper end so as to allow room for a handle. The method of procedure is to place a waste ball in the can and pour about three ounces of carbon bisulphide over it. The lower end of the stick can be introduced into the squirrel burrow to be treated and held rigid with the foot in order to load the waste balls. The ball and superfluous liquid is then poured into the burrow and may be shoved down the burrow with the opposite end of the stick. Allow time for the gas to permeate the burrow (about two minutes) and ignite and close the hole.

### Hose and Funnel Method

Fasten a funnel securely to the end of a three foot length of three quarter hose. Insert the hose as far in the burrow as possible and pour about three ounces of the liquid gas (carbon bisulphide or kilmol) through the funnel into the burrow. In case of a colony, repeat operation for 12 or 15 holes before igniting any of them as the burrow may be connected and the gas is apt to explode in your face. After allowing about two minutes for gas to permeate the burrow ignite and close burrow tightly with earth.

In using carbon bisulphide in colonies or villages all the burrows in the immediate vicinity should be treated before fire is applied. Be careful about ignition as the explosion in one burrow will often ignite all in the immediate neighborhood. The explosion frequently forces the flame two or three feet into the air and care should be taken that the inspector is not standing over one burrow when he ignites another. Carbon bisulphide gas is heavier than air and will fall down to the bottom of the burrow, but it is well to see that all openings are closed before leaving the community.

## WITTE IRRIGATING ENGINES

## SIZE OF PULLEYS

Some Rules for Installation of the Farmer's Power Plant

VERY power-driven machine is designed by its maker to run at a certain speed in order that it shall deliver the best results. But just as long as there is no concerted action between the makers of these machines and the manufacturers of the gasoline engines, which are to run them, in the matter of pulley sizes, more or less trouble for the farmer is sure to result. This will be due to the fact that the speed of farm engines varies so greatly, and because the drive pulleys, with which they are fitted, are of such different sizes. The matter of pulley size never has been standardized, and so the farmer is left pretty much in the dark as to whether his power machinery is being driven at proper speed or not. He never can tell, when he buys his silo filler one make and his engine of another, that the two will come to him equipped with pulleys that will be properly proportioned to make the combination as effective as it ought to be and as it is designed to be.

The present tendency among manufacturers is to decide upon some uniform speed for the drive belt, which, having been determined, would make the coordination of the pulleys a very easy matter to figure out. The trouble at present seems to be that opinions differ widely as to what the standard speed for the belt should be. Present practice is to give belts speed all the way from 1,200 feet to the minute to 3,600 feet. This is too wide a variation, of course, and rather complicates the situation than otherwise. One manufacturer of power-driven machinery, in a recently published interview, says a belt speed very easily could be decided upon which should show no greater variation than from 1,800 to 2,800 feet per minute. This would enable the farmer to approximate the speed of his machine within such narrow limits that he would be enabled, in a majority of instances, to get the highest degree of efficiency out of them.

This same manufacturer says that no power-driven machine should have a pulley of less than eight inches in diameter nor more than 14 inches. Assuming that the farmer will see to it that his pulleys are between these limits, then corresponding pulleys on the engine ought to have sizes as follows, according to the revolution per minute of the engine, to give the proper belt speed:

Engine with r. p. m. of 300, diameter of driving pulley 24 to 36 inches; r. p. m. of 350, diameter 20 to 28 inches; r. p. m. of 400, diameter 18 to 26 inches; r. p. m. of 500, diameter 16 to 21 inches; r. p. m. of 600, diameter 12 to 18 inches; r. p. m. of 700, diameter 11 to 15 inches; r. p. m. of 800, diameter 10 to 13 inches; r. p. m. of 900, diameter 9 to 11 inches; r. p. m. of 1,000, diameter 8 to 10 inches. These relations are worth while remembering, for until such time as real standardization comes, and goodness knows when that will be, the farmer is going to be perplexed continually by such problems as this. But if he will exercise a little care to keep his pulley variations within the limits given above, he will very nearly approximate the best results possible from his power machinery.—F. M. L., in Farmer's Guide.

We wouldn't mind paying two prices for everything we buy if we didn't have a sneaking notion that the second price is graft.

## COLLECTIVELY SPEAKING

"Say, Casey, did you ever make an idiot of yourself over women?" "An idjut, is ut? Sure I've made myself an intoire asylum." Boston Transcript.

## A STUBBORN BEAST

Old Pegasus, they say, 's a horse; Now I would have no duel With wise mythologists, of course, But I think Peg's a mule!

One of the 6 sizes of Avery Tractors

Avery 2-row Motor Cultivator

## Averyize Your Farm Work

THERE isn't any question any more about the success of tractor farming—the only question now is—which is the best tractor for you to get.

When you **Averyize** your farm you can be sure you have made a wise selection. When you get an Avery you are getting a tractor that is long past the experimental stage. It has been put to every test known.

We proved our faith in the Avery design by introducing Avery Tractors on a sold-on-approval policy. We have proved the success of the Avery design by entering it in every important motor contest and demonstration held in this or any other country.

And the strongest proof of the success

of the Avery design is that men who bought the first Avery Tractors years ago are buying more Avery Tractors—sons, brothers, cousins and neighbors who have watched Avery work are buying in large numbers.

Avery Tractors are built by a company having over thirty years' experience in building power farming machinery, with tens of thousands of Avery machines in operation all over the world, and by a company owning a large factory with branch houses and distributors covering every State in the Union and over 60 foreign countries.

## A Size for Every Size Farm and Every Kind of Work

There are six sizes of Avery Tractors from which you can pick exactly the right size tractor for your work.

There's an Avery Two-Row Motor Cultivator for doing your cultivating and other light traction and belt work.

Then you can get an Avery Plow and an Avery Thresher to fit any size tractor, and you have an equipment of Tractor Farming Machinery that will enable you to raise a larger crop at less expense and save it after you raise it.

The five sizes of Avery Tractors—8-16, 12-25, 18-36, 25-50 and 40-80 h. p. are all built of the same design. Also a 5-10 h. p. Tractor, especially built for small farms and lighter work on large farms. Avery Trac-

tors are the only tractors with a double carburetor and duplex gasifier that burns ALL the kerosene. They have a patented sliding frame that eliminates the intermediate gear used on other tractors. Saves expense and increases the power.

They are the only tractors with renewable inner cylinder walls, crankshafts one-half the diameter of the cylinders, adjustable crankshaft boxes, no fan, fan belt, governor belt, fuel pump, or water pump.

### Light and Heavy Plows and Threshers

You can get an Avery Tractor Plow, either light or heavy, in any size from 1 to 10 bottoms, and an Avery Thresher in any size from a small 19x30 inch up to a large 42x70 inch.

## Write for the 1918 Avery Motor Power Book

Get a Guaranteed Avery Grain Saver Thresher in any size, 19x30 inch up to a large 42x70 inch.

It shows all Avery machines in their natural colors, both stationary and actual working scenes. It has unusual detailed illustrations of tractor construction. Write for free copy and ask for special information about the size machines you need. Address

AVERY COMPANY, 3905 Iowa St., Peoria, Ill.  
C. S. Anthony, So. Cal. Distributor, Los Angeles, Cal.

Branch Houses and Distributors Covering Every State in the Union and More Than 60 Foreign Countries

There's a size Avery Tractor for every size farm and every kind of work.

Every ball of the YUBA TREAD kept at work at food production helps as much as a hundred balls flung into German trenches.

**OUR ADVERTISERS RELIABLE**

We guarantee our subscribers against  
 loss through dishonesty of any adver-  
 tisers in the Cultivator. We do not at-  
 tempt, however, to adjust trifling dif-  
 ferences between subscribers and honest,  
 responsible advertisers, nor will we pay  
 the debts of honest bankrupts. Notice  
 of complaint must be sent us within 30  
 days from date of the transaction, and  
 the subscribers must have mentioned the  
 Cultivator when writing the advertiser.

**THIS WEEK'S COVER**

It is most satisfactory when one  
 can load the ordinary two-horse wag-  
 on with the first products of the year  
 and return home with a check for  
 \$1100. Such a load is shown in the  
 engraving on the cover this week. It  
 was taken on the ranch of A. Gustlin  
 of Orange County, and, in addition to  
 showing the one load of walnuts  
 which brought in the satisfactory  
 check, it shows method of ranch care  
 of the nuts. The racks are five by 16  
 feet, six inches in depth, and to pro-  
 tect the nuts from fogs or hot sun the  
 "apron" may be thrown over the ridge  
 pole. A dry rack with the cover over  
 the pole is shown in the background.  
 Walnuts have proven a remarkably  
 satisfactory crop for California and  
 for the whole country, in fact, this  
 year the supply practically all comes  
 from California.

**GOVERNMENT SEEDS**

In order to secure early distri-  
 bution of government seeds the de-  
 partment of agriculture has asked  
 congress for \$6,000,000 to purchase  
 seed to be sold to farmers at reason-  
 able prices. Perhaps this seed will  
 be better than that distributed by  
 congress. That congressional seed  
 distribution has cost the people of the  
 United States millions of dollars with  
 returns which are hard to find.

**INCOME TAXES**

This is the last month for  
 making returns to the income tax col-  
 lector. Every reader of the Cultivat-  
 or must bear in mind that to fail to  
 make this return renders every un-  
 married person with an income of  
 \$1000 or more and every married per-  
 son with an income of \$2000 or more  
 liable to a fine of from \$20 to \$1000.

Now the Cultivator has repeatedly  
 referred to this and takes this occa-  
 sion to suggest again that there is less  
 than four weeks to make out and file  
 return. It is wonderfully complicat-  
 ed and any one who has any question  
 about it should file the report, for  
 there is no disposition on the part of  
 the revenue collector to make collec-  
 tion where no tax is due, but it is well  
 that we all should be familiar with  
 the provisions of the law and the prob-  
 ability of punishment. Presumably  
 under stress of the war patriotism  
 alone is enough to induce us to do our  
 part, but the technical side of these  
 reports must be given attention, for  
 complying with what seems to be  
 mere formality is safer than taking  
 chances.

**BIGGEST ON EARTH**

In magnitude of business under  
 one management Standard Oil, Ameri-  
 can Steel, Copper Syndicate, and a  
 few other great institutions have been  
 referred to as showing the magnificent  
 efficiency secured in the handling of  
 great aggregations of capital. Now  
 comes a gathering of the earth's  
 forces under one management so in-  
 finitely greater that there is practi-  
 cally no comparison. Two hundred  
 and sixty-five thousand miles of rail-  
 way of the United States have been  
 brought under the absolute direction  
 of one man. These railways cost  
 \$20,000,000,000, employ 3,000,000 people  
 and their net earnings are around  
 \$1,000,000,000. The value represented  
 by these great properties is far greater  
 than that of all the railways of Eu-  
 rope, with 50,000 miles to spare. Rus-  
 sia—what was United Russia—was  
 second in railway mileage, but boast-  
 ed only about 49,000 miles.

The experiment that is being tried  
 in this country is of such magnitude  
 and has such possibilities that none  
 can help wonder and ask what will be  
 the result.

**HASTENS MATURITY**

The country never produced such  
 a crop of corn as last year; likewise it  
 never had such a quantity of soft  
 corn. The early fall frosts caught the  
 ripening crop in nearly all of the  
 corn states. Only favored sections  
 shocked, and now thousands of tons  
 are softening or at least lowering in  
 value. The farmer who salted down  
 his corn as it was put in crib finds  
 fairly good results, but the lesson is  
 this, as we note in the Rural New  
 Yorker:

Superphosphate used with the ma-  
 nure would have ripened the corn  
 earlier, and in some cases saved it  
 from frost. There are a few people in  
 the country who accuse us of selling  
 out to the fertilizer trust whenever  
 we advise the use of superphosphate.  
 The fact is that available phosphorus  
 is one of the most necessary fertiliz-  
 ers for all grains. It is also a fact  
 that the fertilizer manufacturers are  
 having their troubles this year like all  
 the rest of us. Shall we be accused  
 of "selling out" to our readers when  
 we tell them that available phosphor-  
 us will not only ripen the grain ear-  
 lier, but plump the wheat kernels and  
 increase the yield?

**CHEAPER FEED**

Under the above title last week  
 we referred to reports of receipts in  
 stockyards of the United States, in  
 which there were comparisons of the  
 years 1917 and 1916, showing that 1916  
 made far greater deliveries than did  
 1917. This should have read; "far

greater deliveries of hogs." One  
 reading the article through notes that  
 it touches upon hog feeding, but  
 strictly, as it stands, the first sentence  
 would convey a wrong impression.  
 Hence a letter from D. O. Lively of  
 San Francisco who calls our attention  
 to the receipts of cattle in 1916 in  
 Chicago, which were 368,291, while in  
 1917 there was an increase of 103,676,  
 the total deliveries being 471,967.

Again, for the first nine months of  
 1917 the receipts of all stockyards in  
 the United States were 14,869,615;  
 during the same period of the preced-  
 ing year, 11,702,955, or over 3,000,000  
 more cattle in 1917.

Now then, we want more hogs; we  
 must have more hogs, but in the beef  
 situation the Pacific Coast is side-  
 tracked for the time being. Hence our  
 meatless day has been declared off,  
 and instead we have now two porkless  
 days. Until the situation is changed  
 somewhat California may eat beef  
 seven days a week.

**WAR SAVINGS STAMPS**

The campaign for war savings  
 stamps which was referred to several  
 times in November and December is-  
 sues of the Cultivator is now on in  
 full force. The price of the stamps  
 will have advanced before these words  
 are read, for on February 1 an addi-  
 tional cent is added to the cost of ev-  
 ery war savings stamp.

A thrift stamp, which is slightly  
 larger than an ordinary postage stamp,  
 costs 25 cents, it bears no interest, al-  
 ways remains of the same value. The  
 purchaser is given a thrift card with  
 place for 16 of these stamps. When  
 filled it has cost \$4.00, which, with 13  
 cents during February, 14 cents dur-  
 ing March, and so on, may be exchang-  
 ed at post office, bank or elsewhere,  
 for one war savings stamp. This  
 larger stamp bears interest at the  
 rate of four per cent, compounded  
 quarterly, which makes it mature on  
 January 1, 1923. With this war sav-  
 ings stamp may be had the war sav-  
 ings certificate with place for 20  
 large stamps, which at maturity  
 makes this certificate, if filled, worth  
 exactly \$100.

By December 31, 1918 it is presumed  
 American boys and girls will have  
 taken these stamps to the value of over  
 \$2,000,000,000, and the \$2,000,000,000  
 will return to the boys and girls who  
 have purchased them to help in their  
 education or in financing some little  
 business of their own in 1923.

We believe no movement of such  
 value was ever handled in this coun-  
 try, and the greatest interest on this  
 \$2,000,000,000 will be the habits it has  
 helped to form. We may safely say  
 that this will not be allowed to be ex-  
 clusively a children's movement, be-  
 cause people of all ages and of all de-  
 grees of prosperity are purchasers of  
 stamps.

Let readers buy long and many of  
 these stamps. They are not transfer-  
 able, but they do have a cash surren-  
 der value, which is stated on the card  
 given with the thrift stamps, and this  
 value becomes greater month by  
 month. The greatest increase comes  
 to those who hold until maturity. The  
 method of cashing in advance of ma-  
 turity is to give ten days written no-  
 tice at the nearest post office.

There should not be a soul in  
 America who is not helping the war  
 to the extent of buying at least some  
 of these stamps.

In the matter of these habits we are  
 forming, we have heard of one other  
 thrift habit, that of saving cancelled  
 postage stamps, which are to be  
 converted into funds for the sup-

port of Belgian babies. Through the  
 Red Cross these stamps are handled  
 and in some way treated so that the  
 dye is extracted, and it is claimed  
 that 1000 stamps will keep a Belgian  
 baby for a month. This sounds over-  
 drawn to us, but perhaps it is true.  
 Even if it is not, there is enough  
 truth in it that it shows one of the  
 many lessons which the present war  
 has brought home to us, that of econ-  
 omizing on the thousands of things  
 which are wasted in this country.

**This Week's War News**

Fires continue to occur in munition  
 factories both in this country and in  
 Canada.

London was bombarded on Monday,  
 the attack lasting five hours. Many  
 were killed and injured.

Italy's front is still maintained and  
 even advanced, one day's reports  
 showing capture of over 1500 Huns.

The large munition factories at Es-  
 sen had a serious strike occasioned  
 by some of the labor leaders being or-  
 dered to the trenches. Food conditions  
 almost approach famine.

There have been many rumors of  
 German submarines observed on this  
 side of the Atlantic. These are not  
 confirmed and it is not known  
 that there have been any sinkings.

It has not been a week of startling  
 war events, but there have been many  
 startling rumors as to peace, but in  
 every case each nation names its own  
 terms which are not acceptable to the  
 other side.

The western front has been general-  
 ly quiet excepting for almost contin-  
 uous artillery action and occasional  
 air battles. Tuesday's reports con-  
 tained accounts of sinking of several  
 German air ships.

In food regulations in this country  
 the one meatless day each week or-  
 der has been revoked as to certain  
 drouth sections of the West, and two  
 porkless days, Tuesday and Saturday,  
 have been named.

Finland has demanded immediate  
 evacuation of Finland by Bolshevik  
 troops. There are reports of almost  
 continual fighting between the Bol-  
 sheviki and Finnish troops with  
 Swedes taking a hand against the  
 Bolsheviks.

The general condition in Russia is  
 one of anarchy, with little news com-  
 ing to the outside world as to any de-  
 finite plan to be worked out. Southern  
 Russia has an organized government,  
 but its hand is not yet strong in the  
 management of affairs with Austria.

Rumors continue to sift through of  
 serious conditions not only in Austria-  
 Hungary, but Germany where laboring  
 classes are entering upon strikes, and  
 from both Holland and Switzerland  
 these reports are confirmed. The  
 morale of the armies is at the break-  
 ing point.

A letter written by the Belgian  
 King Albert to the pope in December  
 has been made public during the past  
 week. He assures the pope that his  
 only desire is to see a just and dur-  
 able peace put an end to the evils  
 which humanity, and particularly the  
 Belgian people, are suffering.

Secretary Baker made address be-  
 fore congress which was roundly ap-  
 plauded. He pledged that a million  
 and a half American soldiers would be  
 on the French front before the end of  
 1918. He spoke of the magnitude of  
 the task which confronted this nation  
 and the masterly way in which it has  
 been handled. It has been learned  
 through Swiss sources that Germany  
 is only beginning to surmise as to the  
 magnitude of America's preparation.

# Agricultural News Notes of the Pacific Coast

## Northern California

Gold dredging has increased since the beginning of the war.

Ferndale creameries all paid 55 cents for December butter fat.

Great numbers of salmon are running in the streams of the valley.

Yolo County's support for the Associated Raisin Company is almost unanimous.

Sheridan Baker of Santa Rosa is made president of the Sonoma County farm bureau.

First farm meeting of a farm bureau center of Eldorado County was that of Mosquito farm center.

Nuestro Farmers League, recently met and elected A. M. Sawyer president and Edward Vivian, secretary.

Eldorado County is looking ahead to the observance of squirrel week sometime during the month of April.

The El Dorado County farm bureau directorate recently met and organized. Burle Jones is adviser for the county.

At the last farm bureau meeting at Bowman, Placer County, resolution were passed urging formation of an irrigation district.

Hydro-electric companies operating in the Coast Range and Sierras will be compelled to use steam power unless heavier rainfall is received.

Butte County Farm Bureau is to make campaign for bigger membership. The slogan is "Over the top with Butte County Farm Bureau."

Butte County is planning for extensive silk production and thinks that within five years there will be many thousand acres devoted to mulberry growing.

A whisky distilling company at Sausalito contemplates manufacturing alcohol and, as a by-product, potash for which a \$500,000 improvement in the works is to be made.

Durham, Butte County, is making an effort to secure the location of the 5000 acre colonization farm. The state board has 37 other tracts under consideration however.

The Sacramento Valley Development Association has a committee at work to determine as to sources of irrigation waters which may be available for use in the Sacramento Valley.

County Horticultural Commissioner Mills of Butte reports production of 60,000 tons of alfalfa in Butte County; 500 tons sugar beets; 1200 tons olives; 2800 tons peaches; 2625 tons prunes; and 37,500 rice.

Farmers committee of the California Development Board is mailing circulars appealing for importation of Chinese labor or at least some plan whereby sufficient help may be secured to plant and harvest crops of the state.

The Eldorado County farm bureau is investigating possibilities of establishing a limestone plant. Adviser Amundsen and the lime committee; J. A. Teagarden, J. A. Livingston, Geo. Petterson, J. H. Wyatt, recently inspected the plant of the Eldorado Limestone and Mineral Company near Shingle Springs.

Fruit shipments from Shasta County, according to report of the horticultural commissioner, include over 2,000,000 pounds of prunes; 60,000 pounds peaches; 48,000 pounds pears; the above all cured fruits; Fresh fruits; 27 cars pears; and other cars of grapes, olives, plums and apples.

## Central California

Fresno is making a pull for the state colonization farm.

A Bakersfield hog grower recently sold seven cars of hogs which brought \$18,816.

Terra Bella irrigation district has handled over \$900,000 of its funds during the past two years.

Oakdale, Stanislaus County, reports shipment of over \$3,000,000 worth of crops from that section.

Kings County bee beepers will co-operate in marketing honey and will meet in Hanford this week to perfect detail plans.

Tulare Cooperative Poultry Association meets Monday, February 4, to eat chicken and talk over the past year's business.

Oakdale, Stanislaus County, is making protest against the use of irrigation canal by Sierra and San Francisco Power Company.

Sugar beet planting of the valley is made far later than any preceding year, and it is now feared that there will be a serious shortage.

Record prices for cream were secured by dairymen delivering at Corcoran creamery. Fifty-six cents was paid for last month's delivery.

State Dairy Inspector Peairs of Tulare says that one great need of the central part of the state is greater acreage of alfalfa. The price at present is above \$25 in the stack.

Commissioner Collins of Tulare County, reports 4060 acres of citrus groves have been fumigated during the last year at a cost of about \$142,000. There were about 2290 acres sprayed.

California Peach Growers branch at Hanford recently met and discussed the matter of the new packing house and determined to make a canvass for a greater membership for Kings County.

San Jose tomato growers are signing contracts with the Cooperative Producers organization and hope to market the principal part of the tomatoes of the Santa Clara Valley through cooperation.

Friday of this week closes the great campaign for signers of the new raisin contract. Presumably enough contracts will be signed to validate, but hard work is being done up to the last moment.

Monterey and San Benito Counties will unite in a squirrel campaign. These two counties will make complete a chain of counties along the coast, over 600 miles long, which are fighting the varmints.

The raisin association reports serious shortage in number of acres required to make the new five year contract effective. Unless the required acreage is signed up prior to February 1 the entire effort will be in vain.

The annual of the Exeter Creamery Association was occasion for making of report which showed receipts for the year over \$300,000 and total butter manufactured, 650,000 pounds. An eight per cent dividend was declared.

Tulare County's cream check for December amounted to nearly a quarter of a million dollars. Kings County also played a close second, only a few thousand short of Tulare County. Some prices ranged as high as 36 cents, with average for churning cream around 53.

## Southern California

Cabbage aphid is still devastating many fields.

Honey producers are planning for large output.

Nearly 70 per cent of Navel oranges are running over size.

The planting of hemp in the Imperial Valley will be large next year.

It is said that over 100 Japanese fishermen are seining fish in Salton Sea.

Home economics is a regular department of several of the farm bureaus.

Olive packing works at Hemet, Riverside County, are putting up 185 tons home fruit.

California Lima bean growers have sold about three-fourths of the last season's crop.

Nearly all tomato canning factories of Southern California ran through the month of January.

El Cajon, San Diego County, farm center is discussing the protein, crude fibre, carbohydrates, etc. of poultry feeds.

Lankershim, Los Angeles County, has a new poultry association. It is expected it will be large enough to make carlot shipments.

Members of the Hemet-San Jacinto Growers' Association are contemplating extensive improvements in the cannery before another packing season.

Poultrymen of Riverside County are planning to stamp date on every egg harvested and build a brand for their eggs, which will justify top-notch prices.

The annual agricultural assembly, at Holtville, Imperial County, one of the principal events of the valley, has changed its date and will now be held February 14.

Sugar beet planting situation is still unsettled, though factory people of Orange County claim there has been about 90 per cent of normal planting in that county.

San Diego County orchardists recently met in the orchard of one of the members of the farm bureau at El Cajon and spent the day studying pruning methods.

Harry S. Smith, superintendent of the state insectary, is in charge of a pest survey of the state. He will work in conjunction with county horticultural commissioners.

The next meeting of the county chamber of commerce of Riverside is to be held at Corona. This body has unqualifiedly endorsed the movement to secure Chinese farm help.

One of the livest farm center sections in the Los Angeles County farm bureau is that of the Antelope Valley. An effort is being made to break the center up into three separate organizations.

The Indio levee district has been prevented from continuing work on its storm water protection levee by a ruling of the superior court, as the court maintained the plans of district were inadequate to control flood waters.

Poultry Producers of Southern California has addressed a letter to its members in which the facts of a recent law suit against a violator of contract of the association are stated and members are urged to stand true to the organization, which is necessary, if the industry is to live.

## The Coast and General

The press of California is insistent in demanding that next year's taxes shall be lower.

Investigations by the bureau of markets indicate supply of frozen and stored beef as much greater than on December 1.

The Lewis County Pure Breeders' Club recently met at Chehalis, Washington. The president for next year is N. B. Coffman.

The American Livestock Association which met recently at Salt Lake City contributed \$20,000 to aid the market bureau in securing greater live stock production.

The eighth annual of the Western Washington Horticultural Association was recently held in Seattle. Special attention was given to increasing horticultural products of the state.

The Arkansas Valley Cow Testing Association, Colorado, has closed its first year successfully. The officers for next year are C. W. Hall, president, R. McCann, Fort Collins, secretary.

Grain farmers of the Northwest are planning for more general bulk storage of their grain than ever before. Whitman County, Washington, farmers will bulk their grain so far as possible.

The American National Live Stock Association in its 21st annual convention at Salt Lake City raised \$30,000 to cover expense of representative to remain in Washington and cooperate with the federal food administration.

It is proposed to make an appropriation of nearly \$10,000,000 for various government reclamation projects. Ninety-five thousand dollars of this is for use in the Orland, California, project and \$950,000 for the Yuma project.

It has been suggested that the transportation situation be solved or at least aided by placing an embargo on all but food and fuel, that is excepting passenger traffic and to control that by greatly increasing passenger rates.

It is anticipated that congress will authorize the registration of young men who have become 21 years of age since June 5, 1917 when the original draft law went into effect. The present indications are that the age limit will not be raised.

The department of labor is endeavoring to solve the question brought up by farmers in many Eastern farming sections in effect that the farmer cannot produce crops if manufacturers of war supplies continue to take their laborers from them at fabulous wages which farming does not permit.

The total ocean going vessels now afloat number about 30,000 with a gross tonnage of 45,000,000. Shipping loss since the beginning of the war has totaled about 8,783,080 tons, and the supply of ships is about 20 per cent of normal, with demand for munition and troop ships far above normal.

As a proof of the value of apples in the present sugar shortage the Iowa state horticultural society calls attention to the high content of sugar in ripe apples. Good grade of strictly ripe apples will run 15 to 18 per cent of sugar, or, as expressed by one, 12 cars of apples would contain something like two cars of sugar.

## Dr. Hess Stock Tonic

25-lb. Pail, \$2.25 ; 100-lb. Drum, \$7.00

Smaller packages in proportion.

### Condition Your Stock Drive Out the Worms

**Spring is here**—your animals have long been on dry feed and as grain, hay and fodder do not contain the laxatives so abundantly supplied by grass, they are apt to be out of fix.

Now's the time to feed Dr. Hess Stock Tonic to **your horses**, to condition them for spring work, so that when the sun shines they will be rid of their old coat, full of stamina and ready for business.

And don't overlook the spring **pig crop**—the money-makers. Start them off free from disease—free from worms, by a course of Dr. Hess Stock Tonic.

**Your cows** will be benefited by Dr. Hess Stock Tonic, and it will keep your **feeding cattle** right up on their appetites during the finishing period.

Excellent for **ewes** at lambing time.

Dr. Hess Stock Tonic contains laxatives to regulate the bowels, diuretics to remove dropsical swellings, tonics to improve the appetite and increase digestion, and vermifuges to expel worms.

There's a dealer in your town that will supply you with Dr. Hess Stock Tonic and guarantee it to do these things.

Dr. Hess & Clark, Ashland, Ohio

## The Alfalfa Weevil Menace

Written for California Cultivator

INTO the office of the state commissioner of horticulture bustled two men resolved to demand that what they considered a senseless quarantine be removed against salt grass hay from Utah. Excelsior is scarce and high and they needed the salt grass as a substitute packing material. However, after they had been seated and had made their demands, the commissioner said: "Gentlemen, the live stock industry of this state depends upon our \$50,000,000 alfalfa crop, and it is to protect it from the ravages of the alfalfa weevil that we maintain a quarantine against all

present time in Utah, the southeastern corner of Idaho and the southwestern corner of Wyoming. It was introduced in some unknown way from the Old World, where it is found throughout the Mediterranean region. It was first discovered in this country near Salt Lake City, Utah, about 13 years ago, where it covered only a few acres of territory. Since then it has spread with considerable rapidity, although it has not made any extended jumps in its distribution.

The adult insect is one of the snout beetles, or rhynchophora, belonging to the same family as the apple curculio and plum curculio of the Eastern states. It is about three-sixteenths of an inch in length, grayish brown in color, and possesses a comparatively long snout. The adult weevils pass the winter on the ground in rubbish and in crevices in the soil. In the spring when the alfalfa begins to grow they come out of their hiding places and begin feeding upon the tender alfalfa shoots. Feeding takes place through the long snout with which it punctures the alfalfa stems for the purpose of sucking out the plant juice. After feeding for several days or weeks during the early spring, egg-laying begins. The adult female bores a hole into the alfalfa stem with her snout, after which she turns and deposits the eggs into this cavity. The eggs are very tiny, golden yellow in color and oval in shape. They are laid in clusters, five to 40 in a mass.

The eggs hatch in a few days, the incubation period depending of course upon conditions of temperature and humidity. The newly hatched larva is pale green, almost yellow in color, with a black head. It soon leaves the egg cavity in the alfalfa stem and crawls up to the tender growth at the top of the plant where it can feed in hiding. In a few days the first molt takes place, the larva now becoming a darker green in color and of course larger in size. In the succeeding molts it gradually increases in size and feeding capacity, and a faint pale stripe appears running down the middle of the back. After feeding for a month or so it becomes full grown, increasing about a quarter of an inch in length. The larva feeds almost entirely on the tender portions of the host plant, in this way preventing it from making any appreciable growth. When the larva or grub has become full fed, pupation takes place. This generally occurs at the base of the plant in the old stems and rubbish usually found there, although it frequently pupates within a curled leaf. The pupa is contained in an extremely delicate, lacy white cocoon through which the contents may easily be discerned. It is pale green in color, gradually becoming darker until just before it changes into the adult beetle, when it takes on a brownish tinge.

The greatest damage resulting from the presence of this insect occurs in the first and second crops. The first crop usually succeeds in making a start in the spring, before the young larvae are abundant. However, the alfalfa stems are soon filled with eggs, and the larvae hatching from these eggs before the crop is cut sometimes cause a total loss. The second crop will usually be a total loss if nothing is done, since the abundant larvae found on the first crop at the time of cutting fall to the ground and overwhelm the new shoots of the second crop so that it is entirely prevented from growing, and the field remains as

Point of Attack

A Friend of the Kaiser  
The weevil greatly enlarged

kinds of hay from Utah." He then went on to explain that the weevil caused a loss of one-third to one-fourth of the crop in the infested districts and that the reason hay straw, tule packing, etc. were excluded also, was the habit of the weevil of hibernating in stacks of hay and like material during the winter. As the commissioner finished his explanation, one of his visitors said, "I did not understand the situation and I am very glad indeed that you maintain such a strict quarantine, as I am an alfalfa grower myself."

Another instance of the working of the quarantine against the alfalfa weevil is the case of a shipment of two cars of potatoes packed in straw, which arrived in Los Angeles last month. These cars were refused admittance and had to be shipped out of the state, although the owner threatened to appeal to the governor. There is no quarantine against potatoes from Utah. Properly packed cars containing no straw arrive and are released continually. The owner of the two cars that were denied admittance was unfortunate in that he did not know the law himself and the railroad agent neglected to inform him. The alfalfa weevil occurs at the

Devasted Field

Condition of untreated field used as a check. The second and third crops on this field made little growth and were much delayed, so what would correspond to the fourth crop was caught by frost.

barren as though the alfalfa had been suddenly killed. The damage in the the infested districts has been estimated at 50 per cent of the entire second crop, where remedial measures are not taken.

Some requests have been made to the state commission of horticulture

to admit alfalfa hay from Utah, and owing to the hay shortage many more requests are expected. However, the commissioner states that the pest is too serious to take any chances with and that therefore he will not permit alfalfa hay to be imported from the weevil infested districts.

## The Care and Feeding of Horses

These hints were issued primarily for boys in the service who are handling horses, but they are of interest to all who have horses to care for.

Remember that the horse is an extremely timid animal and must be handled very gently, though firmly. Always speak to the horse when approaching him; take hold of his headstall carefully, pat him on the neck and draw his head slowly toward you. In tying him be sure that the rope is not so long that he can get his leg or foot over it, as painful wounds are often caused in that way.

In entering a stall do not put your hand on the animal, as that might cause a vicious or stupid horse to kick, especially if you are a stranger to him; but tell him to "get over," and then step in quickly on the left of the horse.

In leading a horse take a firm grip of his headstall or bridle with your right hand, hold the end of the halter rope in your left hand, and keep beside him, not in front of him. If he rears or pulls back, you can let go of the headstall and hold him by the rope,—not trying to struggle with him, keeping your face turned from the animal, but stepping toward him as he goes backward. He must move slowly in going backward, and will soon tire of it.

Do not mount a horse equipped only with a halter; and do not attempt to ride a strange horse unless he is bridled, and there is some one with you to hold him, and lead him about at first. You may be willing to take the chance yourself; but a horse never forgets anything, and if he bolts or throws his rider once, he may do the same thing again at a critical moment. The Prince Imperial lost his life because his horse would not stand to be mounted.

The stomach of the horse is extremely small, and therefore he should be watered at least three or four times a day, and if possible should receive both hay and grain three times a day. The less work he does the more important it is to give him hay often, because a hungry, idle horse is apt to take up some bad habit such as biting, kicking, cribbing, or weaving.

If the horse gnaws his manger or stall it is certain that he needs salt, unless he is very hungry. Keep a lump of salt always before him, if possible.

Horses should be watered first and fed afterward; and if possible watered again an hour or two after eating their grain.

Never water or grain a horse that is much heated;—to do that is likely to "founder" and so ruin him.

Never give grain to a tired horse—let him rest for an hour or two first. Otherwise he is very likely to have indigestion and colic. More horses die from colic than from anything else.

Bring your horse into the stable or camp cool and breathing easily, if possible. Nothing is worse for a horse than chill after being heated. But if for any reason it is necessary to halt or encamp when your horse is sweating,—then blanket him and walk him about, or put him in a sheltered spot and rub him,—according to circumstances. A horse is cold when his ears are cold. Get in the habit of feeling his ears.

Use the currycomb very lightly, if at all. It is apt to hurt the skin of the horse. A stiff brush is better—and much more efficacious if his coat

## THE NEW DE LAVAL CREAM SEPARATOR

Will Give You  
Greater Capacity, Longer Wear,  
Better Service, Bigger Value

THE bowl of the New De Laval has greater capacity for a given size and a given speed than any other. The experience of thousands and thousands of users has proved that a De Laval will outlast and outwear any other make.

Look well to service when you buy a cream separator. That means more than anything else. That should include not only a good working and reliable machine, but the right sort of attention and interest on the part of the seller, not only at the time the machine is set up but as long as you continue to use it. De Laval service is well known. You can depend upon it.

Value depends upon the amount and quality of service the separator gives you—what you get out of it. You get more value for your money when you buy a De Laval, because it will give you more and better service than any other separator.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office as below

## Don't Go Through Another Winter Without a Good Silo

Good Silage will give you the equal of rich, juicy pasture during the coming dry, summer months.

## Decide now to put up an IDEAL GREEN FEED SILO

THESE trying times when your milk flow is shrinking, the cost of feed high and green pasturage scarce, make you wish you had installed an Ideal Green Feed Silo last year.

But there's no use crying over lost milk. The profits you might have had this winter, with milk at present prices, if you had installed a silo, are gone beyond recall. It's too late now to remedy your oversight.

But that's all the more reason why you should make your plans right now to install a silo.

Before you know it the rush of spring and summer work will be on you again, and if you let the matter drag along you will probably come around to another winter and still not have a silo.

Your cows will give 25 per cent more milk on a silage ration than on dry feed with grain, and you can feed them much more cheaply on silage.

An Ideal Green Feed Silo will preserve your silage better than any other silo made, and will last longer. Thousands of Pacific Coast cow owners have proved this to their own satisfaction.

Send for description, telling us how many cows you want to feed and ask for our Dairy Hand Book with Rations for Dairy Cows.

# The Yearly Record

## The True Gauge of Production

Some 20 to 25 pound cows have produced 1000 to 1100 pounds butter in a year, others with 30 to 35 pounds have produced less than 800 pounds a year.

We have in mind a 27 pound cow that is soon to finish a year with nearly 1200 pounds. We also have in mind 38 and even 40 pound cows with yearly records under 1050 pounds.

Which is preferable as the dam of a herd sire?

What assurance has the purchaser of a bull from a 40 pound dam that she is a superior cow, unless it is backed up by a long distance record of equal merit?

Remember that a cow can not be expected to transmit the skill of her handler.

Remember also that we are in position to supply bulls backed by either short, or long records, or both.

Our herd contains several world long distance cows.

It contains eleven cows with yearly records above 1000 pounds, averaging almost 1100.

It contains two cows that have produced over 2300 pounds in two consecutive years, one of which has the world's record of 2426 pounds.

It contains the only cow of the breed that has produced over 1000 pounds for three consecutive years.

It contains thirteen cows over 30 pounds including the highest seven day cow ever tested on the Pacific Coast.

It contains five cows from 34.25 to 38, four of which are the highest ever made in California, and seven that average over 35 pounds.

It contains four of the seven state record seven day cows.

And better still it contains the only bull in the world whose first seven dams average over 1000 pounds in a year. They will average around 1080 and almost 31 pounds in seven days, including his dam's record at two and three years. These averages will surely be increased.

We will be pleased to quote high class bulls to either dairymen or breeders.

is long. The head and legs should never be touched with the currycomb. You can clean your horse with a wisp of hay or straw vigorously used,—or even with your bare hands. At least an hour a day of hard work should be devoted to cleaning a horse. This helps the circulation, removes dead skin and dirt, and makes the horse feel right and look right.

Avoid sore backs and shoulders by keeping the inside of your saddle or

harness perfectly clean, and by sponging or clanning off the saddle or harness marks. The dandruff in the horse's hair is very salt, and when this dandruff dries on the horse or on his equipment, it irritates the skin.

On reaching camp or stable, do not remove the saddle, unless you can at once clean and dry the hair underneath. If that cannot be done immediately, loosen the girth and leave the saddle and blanket on until the hair is dry underneath.

## California's First Forty Pound Cow

Tilly Alcartra, the greatest long distance dairy cow the world has ever produced, is starting off her sixth consecutive year of test in a manner which wins new honors. In former

days. Tilly was nine years old on the second of last October, has dropped six living calves, and has been on yearly test continuously since her first freshening as a senior two year

Tilly Alcartra

The world's greatest long distance dairy producer, whose performance is chronicled by Mr. Hughes on this page.

years she has always made her best seven day record from 30 to 60 days after freshening, and there is no reason to doubt that she will do likewise this year, and the main fact right now is that she has exceeded all her previous records at this point in her lactation period. At this writing Tilly has been in milk less than 30 days and has to her credit for her best seven days the splendid record of 729.1 pounds milk and 40.57 pounds butter, best day's milk 111 pounds. Yesterday was her best day so far, so it is practically certain that she will still further increase her record for both milk and butter. Her best previous records, made at six years of age, are 783.70 pounds milk and 32.23 pounds butter in seven

old. She was the first cow in the world to make over 30,000 pounds milk in one year and at the present time holds all the world's records from two to five years. In her first and only five yearly tests she has produced a total of 123,351.3 pounds milk and 4819.12 pounds butter, a record unequalled by any other cow in the world of any age or breed. And after that unparalleled long distance production record she comes back at nine years of age in apparently the best physical condition of her career and proceeds to surpass her previous short time records. As an example of sustained high production and regular breeding habits Tilly stands without an equal in the history of dairy cattle breeding.

Owners of Cows: 1, 3, Stenzel; 2, 4, A. M. Baldwin; 5, 13, 14, Welch; 6, 20, Beebe; 7, 16, Bomberger; 8, Napa State Hospital; 9, 17, 19, Elliot-Brant Rancho; 10, 18, Copini; 11, 12, Miller; 15, Guise; 21, Bohnett Bros.							

The following are the highest producing cows in herds where individuals produced over 40 pounds of butterfat during December, 1917.

Alba Sadie Cornucopia Creetia, Holstein, seven years, four months, 303 days in milk, 1293.5 pounds milk, 3.74 per cent fat, 48.377 pounds butter fat, owned by A. M. Baldwin.

Irene, Grade Jersey, six years, 231 days in milk, 942.4 pounds milk, 6.00 per cent fat, 56.544 pounds butter fat, owned by Floyd Beebe.

Leda De Kol Ormsby, Holstein, four years nine months, 218 days in milk, 1366.7 pounds milk, 3.24 per cent fat, 44.281 pounds butter fat, owned by A. M. Bibens.

Tillie, Grade Holstein, seven years, 194 days in milk, 1126.5 pounds milk, 3.84 per cent fat, 43.261 pounds butter fat, owned by Bohnett Bros.

Pansy, Grade Jersey, five years, 242 days in milk, 717.2 pounds milk 6.00

per cent fat, 43.020 pounds butter fat, owned by J. M. Bomberger.

Little Surprise, Grade Jersey, five years, 219 days in milk, 663.4 pounds milk, 6.2 per cent fat, 41.131 pounds butter fat, owned by J. W. Coppini.

Golden Idella of Belle Vista, Guernsey, three years four months, 188 days in milk, 677.1 pounds milk, 6.43 per cent fat, 43.538 pounds butter fat, owned by Dr. J. W. Henderson.

Roan Cow, Grade Guernsey, seven years, 256 days in milk, 1094.3 pounds milk, 6.66 per cent fat, 72.880 pounds butter fat, owned by Iver Iverson.

Margaret Aralia De Kol, Holstein, five years six months, 195 days in milk, 1721.6 pounds milk, 4.53 per cent fat, 77.988 pounds butter fat, owned by A. W. Morris & Sons Corporation.

N. S. H. Monte 1st, Grade Holstein, six years, 244 days in milk, 1684.1 pounds milk, 3.86 per cent fat, 65.006 pounds butter fat, owned by Napa State Hospital.

President's Doris of Lewison, Guernsey, seven years, 249 days in milk, 1041.6 pounds milk, 5.03 per cent fat, 52.392 pounds butter fat, owned by Palo Alto Stock Farm.

Alice, Grade Holstein, five years, 265 days in milk, 1426.8 pounds milk, 3.92 per cent fat, 55.931 pounds butter fat, owned by F. Stenzel.

Juanita, Grade Jersey, two years eight months, 213 days in milk, 592.1 pounds milk, 7.7 per cent fat, 45.592 pounds butter fat, owned by G. E. Trigg.

Piertertje Lorene Korndyke, Holstein, four years two months, 224 days in milk, 1244.6 pounds milk, 3.71 per cent fat, 46.175 pounds butter fat, owned by University Farm.

Fern's Sylvana, Jersey, eight years six months, 180 days in milk, 795.0 pounds milk, 6.20 per cent fat, 49.290 pounds butter fat, owned by F. H. Van Derpoel.

Imp. Alcia of Linwood, Guernsey, four years eight months, 275 days in milk, 728.6 pounds milk, 6.16 per cent fat, 44.882 pounds milk, owned by A. J. Welch.

#### BRINGING FEED AND FEEDERS TOGETHER

The California Cattlemen's Association is making a great effort to be patriotic and produce more, but the rainmakers all seem to be in league with the Central Powers. However as a step in the direction of producing more good red meat, they are endeavoring to bring the feed to the feeders. Hence the following resolution:

Whereas, the rainfall throughout California this season is far below normal, and, as a result the feed situation has in certain sections become quite acute, and, whereas, the condition could be greatly alleviated, either by the shipment of feed from sources well known to us to cattle which are suffering, or by the shipment of cattle to portions of this and neighboring states which have a surplus of feed, and, whereas, a reduction in rates by the railroad companies, now in the control of the federal administration, for the hauling of both feed and cattle would make practicable shipments and save many cattle, which otherwise might not survive, and, whereas, in the present crisis it is more than ever imperative that every effort be made to conserve the meat products of the country, and, whereas, the United States food administration is in a position to authoritatively suggest remedial measures, therefore, be it resolved that California Cattlemen's Association in meet-

## Keep Cow Troubles in the Background

Your dairy can be healthy and profitable with but little care and expense on your part—if you just exercise the same "first aid" principles as you would use in your own family. Do not wait until a cow is non-productive; the intelligent use of Kow-Kure will prevent the diseases that sap her life and vigor.

Cows frequently need medical attention, and in most cases you can supply the need yourself with the aid of KOW-KURE—just as thousands of the best dairymen have been doing for over twenty-five years.

Kow-Kure has made many a poor milker profitable. Do you have a cow that is worth the expense of a package of Kow-Kure to prove for yourself what it will do? This well-known cow medicine has a positive action on the digestive and genital organs—a preventive of disease and a sure, quick remedy for such common cow ills as Abortion, Barrenness, Scouring, Lost Appetite and bunches. Used before and after calving, Kow-Kure is a sure preventive of milk fever and Retained Afterbirth.

Kow-Kure is sold by druggists and feed dealers; 55c and \$1.20 packages. Send for free treatise, "The Home Cow Doctor."

## REGISTERED HOLSTEINS

No greater conservation of feed, labor, and money can be made by the dairyman of today than by placing at the head of his herd the right kind of a herd sire.

A registered purebred Holstein bull of good breeding will get the kind of helpers that develop into profitable dairy cows, able to convert the feed they consume into profitable milk and butter production. The overhead expense, including labor, of handling a GOOD dairy cow is no greater than for a boarder, and the only way to breed GOOD cows is to use a GOOD purebred registered bull.

Right now we are offering a limited number of GOOD young bulls sired by

### MERCI LAD KORNDYKE BURKE

conceded to be one of the greatest individual Holstein bulls in the west, and as to his breeding—

He is sired by the noted individual and sire De Kol Hengerveld Burke, one of the greatest sons of De Kol 2nd's Butter Boy 3d, and his dam is that wonderful producer Winnie Korndyke Cornucopia De Kol, 31,034.14 pounds milk and 1201.06 pounds butter in one year, the first cow in California to produce over 1200 pounds butter in one year.

MERCI LAD KORNDYKE BURKE is siring a wonderful lot of calves. Come and see his beautiful sons and daughters and we feel sure you will decide to select one of his young sons to head your herd.

Inquiries or orders by mail will receive prompt attention.

We herewith present the picture of  
**Sir Aaggie De Kol Acme 185724**  
**The Third of Our Famous Sires**

who is no less than the son of Aaggie Acme of Riverside 2nd, who recently finished her year with 1331.41 pounds butter, breaking the official world's record for butter production. Just think! **THE WORLD'S RECORD.** His sire is Aralia De Kol Pontiac Segis, son of Aralia De Kol, 1142.32 pounds butter in one year and the first cow in the world to make over 28,000 pounds milk in one year.

Summing up the three nearest dams of Sir Aaggie De Kol Acme we find their average records to be

Butter seven days	31.29 pounds
Milk seven days	642.60 pounds
Butter one year	1094.21 pounds
Milk one year	22,601.70 pounds

Wouldn't a good bull calf from such a sire be a real benefit to your herd and a money maker for you personally? Think it over. Don't go along in the same old rut, but improve your condition while a reasonable opportunity is at hand.

## We Offer:

### A Son of a 27.91 Pound 3 Year Old That Milked 98.6 Pounds in One Day

He is sired by **FINDERNE SOLDENE VALDESSA** who is being bred to our entire herd of carefully selected females, including five cows with records from 30 to over 33 pounds butter in seven days.

**FINDERNE SOLDENE VALDESSA** is by King Valdessa, son of the great producing and transmitting cow Valdessa Scott 2nd, 41.83 pounds butter in seven days, 164.29 pounds in 30 days, both world's records when made, and she is the dam of five A. R. O. daughters with records up to over 33 pounds butter in seven days.

Finderne Soldene Valdessa

The dam of **FINDERNE SOLDENE VALDESSA** is the world's record heifer Finderne Soldene Hengerveld, 35.34 pounds butter in seven days at first calving, and she is by the wonderful sire King Hengerveld Aaggie Payne who has three junior three year old daughters with records from 31.94 to 37.33 pounds butter in seven days, and four senior three year old daughters with records from 35.33 to 37.13 pounds butter in seven days. One of his daughters holds the world's record in the junior two year old class for yearly production with a record of 1200.64 pounds butter, another holds the world's record in the junior three year old class with a production of 1395.06 pounds butter in one year, and a third daughter made 1075.29 pounds butter in one year as a junior three year old.

**THE YOUNG BULL WE OFFER WAS BORN NOVEMBER 26, 1917. HE IS A NICE STRAIGHT CALF, AND HIS DAM AND SIRE'S DAM AVERAGE 31.62 POUNDS BUTTER IN SEVEN DAYS, BOTH RECORDS MADE AS THREE YEAR OLDS. HE WILL SELL QUICKLY AT THE PRICE WE HAVE PLACED ON HIM.**

## Field Notes from the Live Stock Men

Alexander & Kellogg of Innisfail Ranch on Grisly Island report the following list of cows in their herd that have made the Record of Merit of the Shorthorn breed under official test for 1917: Eva, a three year old record of 6,910.2 pounds milk, 255.7 pounds butter fat in 309 days; four year old record of 9,604.2 pounds milk, 341.3 pounds butter fat in 295 days. Princess Clay, a three year old record of 7,609.9 pounds milk, 267.10 pounds butter fat in 322 days. Lady Starlight, a four year old record of 8,039.1 pounds milk, 332.17 pounds butter fat in 305 days. Buttercup, a three year old record of 7,039.1 pounds milk, 267.34 pounds butter fat in 297 days. Glenside Belle, a four year old record of 7,691.8 pounds milk, 315.19 pounds butter fat in 297 days. Flower Girl 2d, a three year old record of 9,059.2 pounds milk, 343.2 pounds butter fat in 330 days. Bellvue Daisy, a six year old record of 8,480.1 pounds milk, 322 pounds butter fat in 358 days. She nursed her calf a month before beginning test. Greenhill Caroline, a two year old record of 6,220.9 pounds milk, 242.4 pounds butter fat in 277 days. She is now producing with second calf 50 pounds a day. Six imported cows with records made in England as follows: Welfare 11th, 6,880 pounds milk with first calf; Gipsy's Maid, 7,287 pounds with first calf; Royal Rose 4th, 9,655.5 pounds; Lady Beatrice, 8,538 pounds; Favorite 4th, 8,360 pounds; Countess of Heggle 3d, 9,952 pounds. The owners write: "We are getting some splendid calves sired by our imported bull Kelmscott Viscount 19th. A young bull out of Greenhill Caroline, sired by him, weighed at one month and nine days 160 pounds. We are fortunate in having plenty of feed for our cattle and all are doing well. We have five cows on official test now and expect to have more in the near future."

Jane Garden Farm, owned by Fred W. Kiesel, Sacramento, is finding ready sale for the splendidly bred young registered Holstein bulls produced in the herd. One buyer recently took four of them in one lot, all that were on hand near service age, and several other buyers have recently found bull calves to suit them.

Miss Valley Mead De Kol Walker still continues her record breaking performance in the herd of A. W. Morris & Sons Corporation, Woodland. Not content with her record of 24.70 pounds butter in seven days, eight months after calving as a junior three year old, which exceeded the previous world's record by over two pounds, she has gone ahead and increased her record to 25.25 pounds butter, thus establishing a new California record.

The former record was held by Aralia De Kol at an even 25 pounds and has stood for several years.

Aralia De Kol Mead, daughter of King Mead of Riverside and Aralia De Kol, is now the California record holder in the seven day division of tests begun eight months or more after calving. She has been on strictly official yearly test for more than nine months in the A. W. Morris & Sons herd, and in seven days she recently made 25.51 pounds butter, thus exceeding the record made by Miss Valley Mead De Kol Walker only a few days previously. Both of these are still on official test and as both of them still appear to have something in reserve it is a nip and tuck race to see which one will first reach her limit in this test.

The Hollister herd of registered Holsteins, owned by The Lewis Company, is rapidly rounding out, the latest acquisition being several fine daughters of the proven bull Sir Skylark Ormsby Hengerveld, and three daughters of Dora Thorn Sir Josephine, including the 28.43 pound cow Oristeria Overton Mechthilde 3d and her beautiful heifer calf by a son of King of the Pontiacs. The owners of this herd are selling their dairy product to the Alpine Condensary at Hollister. The herd will be gradually enlarged and the farm of several hundred acres improved. The idea however, is to have the breeding establishment strictly on a commercial basis, and there will be a price on every cow, heifer, or bull on the place. Many of the females in the herd already have large official records and testing will be continued.

Mysie's Lady of Claremont, a registered Guernsey heifer owned by L. D. Smith, Berkeley, recently completed an official yearly record that is in many respects a remarkable one. At four months of age she went out on the Berkeley hills to shift for herself, and stayed there until within a short time of her calving at the age of two years and one day. During her year's test she rustled for her roughage in the dry hill pastures, and was fed a very limited supplementary ration of ground alfalfa, cocoanut meal, ground barley, and middlings, with no succulent feed. She carried twin calves 280 days of her test, dropping them 17 days short of a year on test, and she finished with the nice record of 9574.1 pounds milk and 494.88 pounds butter fat, equal to 582.21 pounds butter 85 per cent fat, and thus giving her third place in Class GG of the Guernsey Advanced Registry.

Pontiac Korndyke is now in the list of sires of 40 pound daughters, through the recent record of his six year old daughter Fairview Korndyke

A Prize Winner  
A fine sow on the ranch of F. A. Brush

## "The Best Managed Sale I Ever Attended"

is what a prominent breeder from out of the state remarked after the Guaranty Sale at Sacramento.

We give to every sale, big or small, the same efficient service that won the approval of the breeder above quoted, a service backed by an equipment and organization that has already brought about a new order of things in public sales of registered livestock in California.

If you want to sell your whole herd or consign high class animals to a consignment sale, let us go over the matter with you.

**H. I. MARSH, Modesto, Cal.**

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

Meta who made 776.2 pounds milk and 46.71 pounds butter in seven days. This is the fourth highest seven day record to date in Holstein official records, and she is the twenty-third Holstein cow to make an official record above 40 pounds butter in seven days.

Dairymen in California are becoming more and more discriminating in the purchase of registered bulls to head their grade herds and it is not infrequent that a dairyman insists upon a class of sire that in former times would be considered only by a breeder of registered cattle. Thus we find two instances lately that show the trend of the times. A. W. Morris & Sons Corporation, Woodland, recently sold a young bull backed up by very high yearly records to a Portuguese dairyman for \$1000 and another to a neighbor of this same dairyman for \$500. At about the same time Henderson Company of Sacramento sold a young son of their most richly bred heifer to Moreing Bros. of Stockton for \$1000 and another well bred young fellow to the same people for \$500, both of these bulls going into a grade herd.

There is living in San Jose, at the present time a man who has the distinction of having been a pioneer in the introduction of registered cattle into the great Holstein state of Iowa. Charles Brenner is a booster for the breed in the most genuine sense. A man of attractive personality, it needs but a few moments of conversation to show that he has been a real success in the farming business. In Mr. Brenner's own words: "When I bought my first registered Holstein bull calf and paid \$200 for him my Norwegian neighbors in Iowa thought I was crazy. The next year they were falling over themselves to buy grade bull calves from this sire at \$75 each. It was the best investment I ever made in my life." Mr. Brenner is now retired and living on the fruits of his efforts which he has no hesitancy in saying were greatly increased through the Black and White breed. Realizing that he had an abundance stored up for the future he rented his prosperous Iowa farms and has come to California to make his home.

Things have begun to move in the high class herd of registered Holsteins recently established by J. T. Shanahan at East Aurora, New York. It will be remembered that after purchasing a considerable number of the very top females in the most select Eastern sales, Mr. Shanahan bought the six months old bull calf Majestic Rag Apple in the Dairymen's Convention Sale at Syracuse last December for \$35,000. He also selected as the man to develop the great foundation he had secured, Walter A. Salisbury who had made a very substantial success as superintendent of Brothertown Farms at Utica, New York. The first indication so far from the new establishment comes in the form of announcement of a 40 pound record. The maker is the junior four year old heifer Verona De Kol Beets and she has to her credit 720.9 pounds milk and 40.08 pounds butter in seven days, making her the twenty-fourth Holstein cow with an official record above 40 pounds butter in seven days.

Ed M. Walker who has a splendid herd of registered Holsteins in San Diego County writes that he has recently sold a number of good heifer calves at satisfactory prices and also recently sold five young bulls to go to Phoenix, Arizona. Mr. Walker has an excellent herd of cows headed by two exceptionally well bred bulls.

## King of the Black and Whites 83354

### The Greatest Producing Sire in California

Now has 30 A. R. O. daughters, a greater number than any other sire in California, and more coming right along.

He was the first bull in the world whose seven nearest dams averaged over 30 pounds butter in seven days, and this is only one instance of the remarkable uniformity of the great production records in his pedigree both for milk and butter.

He is transmitting his wonderful inheritance of large milk and butter production because there are no weak spots in his breeding for generations back, no throwing back to a low producing ancestor, and by every law of animal breeding his daughters, as they are already proving, will be uniformly great producers and his sons will hand down his good quality to their offspring.

### King of the Black and Whites

is being given a full opportunity in our herd where he is being mated with a large number of high record cows and highly bred heifers. We have none of his offspring to offer at present, but if you want to keep your herd in line with the march of production records it will interest you to visit our herd and get acquainted with these matings.

We have a limited number of grandsons of King of the Black and Whites and King of the Pontiacs for sale at moderate prices and terms.

We offer for sale some well bred heifers and cows, some of them in calf to King of the Black and Whites. Write us if you need one or a number.

### HENDERSON COMPANY

Sacramento Bank Bldg. Sacramento, Cal.

### KING KORNDYKE PONTIAC 20th

is not made great because we paid \$6500 for him at public sale, rather, our firm belief that he is one of the greatest young bulls of the breed today determined us to buy him at any reasonable figure and we consider the price at which we bought him reasonable.

Keep your eye on KING KORNDYKE PONTIAC 20TH in our herd. Visit our farm when convenient and see for yourself the quality of the females with which he is being mated and you will surely find something later on from these matings that will fit in with your own breeding plans.

And have you noticed how wonderfully Miss Valley Mead De Kol Walker, dam of KING KORNDYKE PONTIAC 20TH, is performing? Her

latest figures for butter in seven days eight months after calving are 25.25 pounds, thus exceeding the state record held for several years by the former world's record milk cow, Aralia De Kol, and she still seems to have still further increase in reserve.

RIGHT NOW we offer several young sons of our senior herd sire

#### PRINCE RIVERSIDE WALKER

son of Prince Gelsche Walker and Aaggie Acme of Riverside, also a few youngsters by other high class sires and out of highly bred dams with good records.

We especially invite the inquiry of owners of good dairy herds. We feel sure that we can suit you in breeding, individuality, and price, in the bull you require to head your herd.

OUR ENTIRE HERD IS TUBERCULIN TESTED

### Tulare Holstein Farm

W. J. HIGDON, Owner

Tulare, California

## Think Again!

And you will find it to be good business to not only see that your next herd sire is backed by great yearly record breeding, but that he is a grandson of that greatest of all long distance cows, Tilly Alcartra, who has produced a total of 123,351.3 pounds milk and 4519.12 pounds butter in five consecutive years under semi-official test and now comes back with a record of over 36 pounds butter in seven days at her sixth freshening. Her son

### Prince Alcartra Korndyke

heads our herd, and he is sired by that sterling sire Korndyke Queen De Kol's Prince. He is already a proven sire, for his first five two year old daughters to finish yearly test average 15,333 pounds milk and 675.92 pounds butter, placing him among the leading young yearly sires of the breed.

We offer a few of his young sons out of well bred dams with good records, at moderate prices.

The J. S. GIBSON CO.

Williams, Cal.

Better service is assured by the advertiser if when writing you mention the California Cultivator.

### TREES

**Fine Lemon and Valencia Trees** at a very low price. Several have taken advantage of our special offer on this excellent stock and we suggest that if you desire any of them you should communicate with us at once. Trees are straight and clean with fine healthy foliage—are growing in sandy loam and give exceptionally good promises for producing fine groves. As we intend to dispose of our entire nursery this year this is a splendid opportunity to buy some A-1 stock at a reasonably low price, considering the quality. Future profits depend on the selection of the right trees. Phone or write us at once and we will arrange to take you to our nursery near Whittier to see these trees. Los Angeles Ice and Cold Storage Co., P. O. Box 643, Station C, Los Angeles, Cal. Main 8191; 10053.

**For Sale to Nurserymen or Large Planters**—Owner of a large block of very fine Eureka Lemon trees will sacrifice at a ridiculously low price to those who will take a large quantity. These are not old dirty culled over stock, but strictly first class trees, clean, thrifty and straight, budded high on sour stock, never have been frosted or stunted in any way. Ground has to be vacated by June 1, so this stock will actually be sold at LESS THAN SEEDLINGS CAN BE RAISED. Address X, California Cultivator.

**For Sale or Exchange**—5000 Eureka lemon trees selected buds inspected stock now located Riverside County. Submit best cash offer or advise fully what you have have for exchange. Chas. S. Brown, 1318 Santa Fe Ave., Los Angeles, Telephone A-9260, Main 7164.

**Mission and Manzanillo Olive trees**, all sizes and prices sure to satisfy. Write us at once for any amount. We want to sell. Imperial Valley Nursery & Seed House, El Centro, Cal.

**Pistache Scions** best imported varieties from bearing trees. Our pistache orchard largest in United States. Pecan scions finest varieties. Tribble Bros., Elk Grove, Cal.

**For Sale**—Eureka Walnut grafting wood. R. M. Fav. R. D. 4, Anaheim, Cal.

HOGS

**The Billiken Brand of Chester Whites**—There is right now a big shortage of swine in California. The output of 1918 will show even a greater shortage unless the farmers of this state get busy and raise more hogs. Good breeding stock is scarce and hard to get. **THE BILLIKEN BRAND** represents the best obtainable; they are of that mellow type that mature early and are such satisfactory easy feeders. Get started with this strain and help out the Food Administration and your own pocket as well. Write me your wants—do it today. I can still furnish first class animals at reasonable prices. C. B. Cunningham, Mills, Cal.

**Grape Wild Farm Berkshires and Guernsey Bull Calves**—Only a few more boars left from 6 months to a year old, sired Grand Leader 2d, the Grand Champion of the world. Also a few of the tops from our fall litters by Royal Superbus and Fashion Longfellow 27th, and a few bred glits. Our herd won the Premier Breeder's Ribbon at the P. P. I. E. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

**Bernsteins Herd**—"One of the Best in the West" has three great herd boars. King's Big Bone Leader, Young Jumbo, and King's Massave Orange. Watch for the sensational offering of sows bred to this great trio which sell in the Big sale of the Kings' County Poland-China Breeders at Hanford, February 20. Bernsteins Ranch, Hanford, Cal. W. Bernstein, Proprietor.

**Large Type Poland-Chinas**—The hog for the farmer if he wants to make money. I have the best lot of weanlings that I have ever seen and they are sired by my boar, Long Smooth Jumbo, and if he keeps on growing the way he is, his name will soon be too small. H. Christiansen, R. D. 4, Riverside, Cal.

**Superba, World's Grand Champion Poland-China** boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

**Duroc-Jerseys**—Sold out of bred glits. Two service boars. One of them an outstanding individual for sale. Also Fall Pigs, both sexes. Twenty-three ribbons on 11 entries, including 6 championships, State Fair, 1917. Frederick M. Johnson, Napa, Cal.

**Berkshires**—First prize junior boar; first and second senior boar pigs including junior champion; fifteen spring and fall open glits sired by Ames Rival 15, champion boar; and two junior yearling bred sows priced cheap for immediate sale. F. D. Hall, Perris, Cal.

**We Pay Cash for Hogs of All Sizes**, weights and breeds. Any number from one to several thousand considered. What have you? Durbin and Forbes, 722 San Fernando Building, Broadway 4170, Los Angeles

**Large Yorkshires**—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Colton, Cal.

**PLW Durocs**—Eastern selections made by R. K. Walker in January. Peters, Lamson & Walker, Devore, San Bernardino County.

**Large Type Poland-Chinas** are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, Cal.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Disposal of Property

A man without wife or child dies leaving personal property; he has parents and a sister. What is the California law in this case and must the matter be taken into court?—Subscriber, Orange.

The estate will go to the father and mother in equal shares. No valid title can be passed to the personal property except under decree of distribution by the probate court.

Liability for Accident

An owner of an automobile takes a friend out for a ride. An accident occurs. Can the owner be held liable to the passenger?—Subscriber.

A private carrier with or without reward may be held liable for all such losses or injuries as may result from his negligence or that of his servants and while he is not an insurer of their safety he is bound to exercise ordinary care.

"Buyer Beware"

A lessee of a farm informed me that he had purchased all tools and furniture of his landlord. After staying a year he sold everything off and left the country. The landlord states that the lessee did not purchase all of the goods but did purchase a part. I purchased goods which the landlord states belong to him. Can I sell the goods and what can the landlord do

if I do sell it? Do I violate any law if I sell after I have been informed it belongs to the landlord?—Subscriber

The ancient and well established rule with respect to purchases such as the above is and always has been, "Let the buyer beware." In other words the buyer must see at his peril that the seller has title. This is modified by the rule that where the owner clothes another with the apparent power of disposition, such as the case of a commission merchant or other broker, a bona fide innocent purchaser for full value will take title. Whether the modification is the rule in any case is a question of fact upon the evidence adduced. The prudent man in the case stated, however, would have made investigation from the landlord as to the title before paying his money to a tenant as it is unusual to say the least for a tenant to purchase all the tools and furniture of a farm. If you sold now, after notice from the landlord, you could certainly be held liable for damages from your vendee and from the landlord for the further trouble caused in his pursuit of the property.

Employee's Insurance

I have employes on my farm. In case of accident, under the present law is a farmer responsible? Shall I have my men insured?—Subscriber.

The workmen's compensation act, as amended in 1917, excludes from the operation of the act any person whose employment is both casual and not in the usual course of the business or occupation of the employer and also any employee engaged in household domestic service, farm, dairy, agricultural, viticultural, or horticultural labor, or in stock or poultry raising.

We may add that many farmers prefer to elect to take advantage of compensation and carry with the state insurance enough to cover possible accident.

Terms of Lease

I have a lease on a farm for three years and six months; to insure payment of the rent I agreed to furnish a bond in the shape of a mortgage on certain city property; the landlord agreed to pay all expenses necessary for a title company to show this mortgage of record. The expenses were over \$10 and the landlord refused to pay and the delivery of this bond has been delayed for over a year. The landlord has accepted his rent to date and in fact is paid for some time in advance. He threatens to sue me for breach of the lease on the ground that I have not furnished the bond. Let me know if I am right or wrong.—Subscriber.

If the question as above re-stated is a correct statement of the facts, the landlord has waived all right to sue for the breach for non-delivery of the bond. First, he did not pay the expenses of the bond as he agreed and he cannot complain for the non-delivery has been caused by his own omission. Second, he has accepted rent with knowledge of the breach alleged and thus, under a long line of decisions of the courts, he has waived his right to claim any breach done prior to the acceptance of rent, as actionable ground for cancellation of the lease.

Stamp Tax on Deed

In order to disincorporate B executed a deed of a farm to A in 1916. A gave B a contract to sell to B for \$6180 and assumed a mortgage on the property for \$2800. In December, 1917 B obtained a mortgage for \$4500 with which he paid off the mortgage for \$2800, then gave a second mortgage to A for \$1900 and obtained a deed from A. These last three deals bear date the same day. How much revenue stamp tax should be paid? B claims an entire exemption while the recorder claims that \$6.50 should be paid.—Subscriber.

If at the time of sale the mortgage for \$2800 was on the property, then the stamp tax would be based on a valuation of \$3380 and your tax would be \$3.50; if the mortgage was removed from the records prior to time of sale then your tax would be \$6.50. It certainly could be no less than \$3.50, and unless such stamps are affixed to the deed at the time it is recorded some one is guilty of a misdemeanor and the recorded deed is worthless as conveying title.

## Get 100% Efficiency From Your Feed

The U. S. Food Administration predicts a 40% to 50% reduction as compared with last year's poultry feed prices. But you cannot afford to waste a pound of feed. You are wasting it—losing good dollars—if your fowls are not digesting it perfectly.

**Perfect digestion prevents feed waste and increases production.** Your birds will get the full benefit of everything they eat and earn bigger profits if you use

### Pratts Poultry Regulator

*America's Original Guaranteed Poultry Tonic and Conditioner*

It assists digestion in a natural way—tones up the entire system—sharpens the appetite—stirs sluggish egg-producing organs into activity—makes hens lay—turns loafers into steady producers.

Used and recommended by leading poultry authorities. Pres. T. E. Quisenberry, of the American School of Poultry Husbandry, uses it at his great experimental farm. He says:—"Pratts Poultry Regulator is used every day in the moist mash, except when salts or sulphur are fed. We use this as per directions furnished with the Regulator." It will pay you to follow the advice of this recognized authority.

Our dealer in your town has instructions to supply you with Pratts Preparations under our square-deal guarantee—"Your money back if YOU are not satisfied"—the guarantee that has stood for nearly 50 years.

## Rations for Baby Chicks

Written for California Cultivator by Jean A. Koethen

**T**HERE are as many methods of feeding baby chicks as there are people who raise them. Everyone, no doubt, thinks his way is the best, and so it is, for him. For it is only as we get beyond the need of following any particular formula and grasp principles instead of methods that we may count ourselves masters of the art of chick raising. The master or mistress—it is as often the one as the other—knows that the same end may be attained in a dozen different ways. The way I choose is the one that happens to be most convenient for me or best suited to my breed of chicks.

Chicks that are brooded artificially always require a little more careful feeding than chicks cared for by a hen. There is more danger of chilling and the indigestion that almost inevitably results. Given a good mother hen with a dozen chicks and plenty of clean range, you may feed them almost anything you will, within reason. Chick feed, rolled oats, bread and milk, chopped hard boiled egg, bran, pinhead oats, all are good, and it makes very little difference which the chick is started on so it is given a variety as it needs it. Eggs that have been tested out from under the hen the seventh or eighth day, boiled till they are mealy, and chopped with an equal amount of very dry bread crumbs, have been for many years a standard first feed. Now that we are Hooverizing we can hardly spare either bread or eggs, and it is not at all necessary. Where large numbers of chicks are raised such fancy feeds are out of the question, and it is just as well to start the chicks on the grains they will have to grow up on.

At the Connecticut experiment station, the first meal, which is given when the chicks are about 48 hours old, is sour milk which is just beginning to thicken. This is kept before them in shallow pans in place of water for the first ten days. The first solid food is chick feed. This is scattered rather sparingly in the scratching litter the first week so that the chicks may learn to eat and to scratch at the same time. The chick feed consists of the following grains: Cracked wheat, 15 parts by weight; fine screened cracked corn, 15 parts; pinhead oats, 10 parts; broken rice, 3 parts; chick grit, 5 parts, and fine charcoal, 3 parts.

After the first week the following dry mash is kept before them: Bran, 10 parts by weight; cornmeal, 5 parts; middlings, 5 parts; ground oats, sifted, 5 parts; beef scrap, sifted, 5 parts. If sour milk is fed only half the amount of beef scrap is used. Green feed is given not later than the second or third day, mangels cut into cubes being used. As soon as the chicks are old enough to be out they are given grass or clover range.

At the California experiment station at Davis the chicks are not fed for from 60 to 72 hours after the hatch is completed. When they are first put in the brooder a fountain of water is put before them and they begin to pick up the sand from the brooder floor. The first ration given consists of equal parts fine cracked wheat, fine cracked corn and steel cut oats, which is left before them in a wooden tray the first two days so that they may learn to eat. When they have learned, the grains are scattered, first on the sand, then over a light litter of cut

alfalfa or clover, and the chicks from this time must scratch for all their grain. On the sixth day a dry mash composed of two parts each of bran, middlings and beef scrap, one part corn meal or barley meal, one part powdered bone, and three parts powdered charcoal by weight is fed at 10 o'clock, and the grain mixture is scattered in the litter early in the morning and about 2 p. m. No further change is made till the chicks are two weeks old, when the dry mash is left before them a little longer each day. By the eighth or tenth week the mash is left before them all the time.

Sour milk is one of the best feeds for chicks of all ages. It is the best preventive, other than sufficient warmth, of diarrhea and the only known cure for coccidiosis. It contains protein in a more digestible form than meat or any of the meat meals, and its use is the most certain guarantee of health and rapid growth. How the present scarcity of milk is going to affect the baby chick industry I do not know. Perhaps the goat will help us out, but even goats must eat.

The above methods of feeding are followed more or less closely by most California poultrymen. One man, who has had marked success, follows the Davis schedule quite closely till the chicks are ten days old. After this time the mash, instead of being specially ground for the chicks, consists of the laying mash which is fed to his hens mixed with an equal amount of bran. This is mixed with cottage cheese until it is crumbly but never really wet. This mixture is fed at first twice a day, in the middle of the forenoon and the middle of the afternoon, but one meal is dropped after a time, the one daily feeding being continued till the chicks are three months old. Another man, a very successful fancier, feeds only commercial chick feed the first five days. At the end of the fifth day a hopper of plain bran is added. This is left before the chicks. After the eighth day corn meal (coarse), beef scrap and charcoal are added to the bran according to the following formula: Bran, two parts; corn meal, two parts; beef scrap, one part; charcoal, one part. When the chicks are three weeks old their scratch feed, which has so far been only commercial chick feed, is changed to a mixture of one part oat groats, two parts wheat and two parts cracked corn. After they are three months old the chicks are fed a mash consisting of 100 pounds laying mash and 100 pounds fine ground oats. The scratch feed about this time is changed to a mixture of equal parts cracked corn, whole oats, wheat and hulled barley.

Now that both wheat and corn are so expensive it is a question how these formulas may be modified to meet changed conditions and yet give the chicks the required nourishment. Bran and middlings are still within our means, and we are promised that corn may soon be. Ground kafir and broken rice are both fair substitutes for the grains we have been accustomed to use, and sprouted oats are a splendid feed for chicks. It may be we shall have to cut down the number we try to raise and depend more on green range. At any rate, the problem, how to raise chicks without wheat or corn, is one which may well engage our most serious attention. We cannot stop raising chickens, and they must learn to thrive on what we can give them.

An essential part of all chick feed-

ing is the delaying of the first meal until the chicks are really hungry. The day it hatches the chick draws into its intestines the yolk of the egg it is leaving, and this is sufficient food for from 48 to 72 hours. If more food is given before this is digested, digestion is interfered with and bowel trouble may result. Just how long this yolk remains undigested may perhaps depend on circumstances,

such as the vigor of the chick and the warmth and rest it gets. I have never seen any ill effects from feeding chicks at from 36 to 48 hours after hatching, but my chicks are usually mothered by hens, and this makes considerable difference. There can certainly be no harm in making the chick wait till it is at least 48 hours old, and much trouble may be saved by this precaution.

## Up-to-Date Poultry Ranch

Written for California Cultivator By M. C. Holman

IN a little valley just back of Benicia, nestled snugly in the hills, lies the extensive plant of the California Poultry Company. No cold from the ocean, no winds from the north can disturb the serenity of this ideal spot, for its natural barriers give it exemption.

For a long time California has depended upon an auxiliary supply of poultry from the East, but with prices and demand in excess of ordinary, poultry has not found its way to the West in sufficient quantity to relieve the market and the demand is still unsatisfied. With poultrymen killing their hens to avoid feeding them through the strenuous times of high prices, the condition of the market is likely to be further subjected to severe changes.

San Francisco is a city of delightful eating. It craves the best the market can produce and is willing to pay the price. This demand and willingness to pay are the primal motives for the establishment of the field branch of the California Poultry Company.

It is due to the foresight and genius for management of W. E. Coleman, the manager, that the plant has taken on its enormous proportions. The plant is composed of 159 acres. It contains five large brooder houses, each measuring 35 by 200 feet. Besides these there is the incubator house, the granary, with a capacity of 14 cars, the steam room, the cutting room, the water supply station and the additional houses which will be used as laying houses when the plant shall have been more fully developed.

It has long been a pet notion with hatchers that chicks cannot be made to pay when hatched through the year and that the spring is the one time to hatch chicks. This theory has been entirely exploded by the Benicia plant, for chicks hatched in the fall are just as good, grow just as well, sell for as much or more than those hatched in the spring, when there is an over production which causes prices to fall very perceptibly. This plant is the only one in the world where hatching is carried on all through the year.

Into the first of the five houses the

young chicks are placed. The number will be from five to twenty thousand at a time. At our recent visit we saw more than 15,000 chicks, all of the same age. The chicks remain in this brooder house for three weeks, when they are transferred to the second, or growing house. They usually fill two of these houses, for a little more room must be given them. They remain in their new house for another three weeks, being fed in the best possible manner and taking on flesh at a rapid rate. At the end of their allotted time they are transferred to the last of the chick houses, where they remain till they are old enough to be sent to market. This is at the end of the eighth week when they are just in the tender chicken age to be most palatable. They are then sent to the San Francisco house of the company to be fattened as rapidly as possible and slaughtered for food. About 50 dozen of these young broilers are shipped from the plant every day throughout the year.

Every modern convenience is afforded the young stock to attain the greatest possible growth. Temperature, food, sunlight, ventilation and running water are all provided, insuring health, vigor and rapid growth.

Cleanliness is the one feature of the plant that stands out prominently. A hatch is arranged for every four weeks. The chicks are transferred every three weeks, thus there is a week intervening from the departure of one lot to the arrival of the next. That time is put to good advantage. All sections of the house are thoroughly cleaned. Every hover and every board is removed, cleaned and thoroughly disinfected with a combination of crude carbolic acid and kerosene. Lice cannot live in such surroundings. Fresh, clean straw replaces the old, and everything is made ready for the new occupants. The steam heating plant is given a thorough test to see that it comes up to requirements so there may be no loss of chicks due to a fall in the temperature. Watchmen constantly patrol the plant at night.

The future of this company is particularly bright. With ample room to broaden out, with a market for all they can raise, with brains and ability back of the enterprise, there is every reason to think that within a few years the plant will have been more than doubled. It is also the intention of the company to have laying stock. Two large houses are now in course of construction for that purpose. Each house has a capacity of 5000 and is divided into laying units for from 200 to 500 hens each. Removable nests have been provided and everything awaits the arrival of the layers. Heretofore the eggs have been purchased in the open market, but with the advent of the hens in sufficient number to supply all demands, if this is ever possible, there will be a complete plant supplying the broilers from shell to market.

The outlying land is being prepared for the production of such green feed as the chicks may need. There is ample ground to raise everything in the green line that will be called for, and it will be served to the chicks thoroughly ground and fresh from the field.

What the California Poultry Company has done can be done by any similar combination of brains, ability and push. Visitors are cordially invited to inspect the buildings and grounds. Hours are from one to five every afternoon.

The BUCKEYE  
Incubator Hatches More  
and Better Chicks

The STANDARD  
Colony Brooder Raises  
Every Raisable Chick

Here's  
the  
Answer

Your country  
needs meat. The vis-  
ible supply is very low.  
Poultry alone can be raised  
quickly.

The Buckeye Incubator and  
the Standard Colony Brooder  
make it possible also to raise poultry  
profitably always.

There's no guess work about it.  
Given good hatchable eggs, the incubator  
will always bring out the full number  
of healthy chicks. Put them under this  
brooder, and 95 of every 100 can be  
raised to a marketable size.

That's strong, but read why:

BUCKEYE  
THE PERFECT INCUBATOR

It's built up to a standard, not  
down to a price. It embodies all  
the experiences of 25 years' suc-  
cess. Its principles are recog-  
nized everywhere as correct, and  
its construction is perfect.

It is used by over half a mil-  
lion breeders—in the largest  
ranches and in the piano-box  
outfit of the beginner—and every  
user is enthusiastic. All the Ag-  
ricultural Colleges and Experi-  
ment Stations endorse it. Suc-  
cess always accompanies it.

Our guarantee is simple, but  
look! Put a Buckeye in the  
same room with any other in-  
cubator. If it doesn't hatch  
more chicks and stronger chicks  
than any other, regardless of  
price—the first time you use it—  
we will take it back.

There's real reason for Buck-  
eye superiority. We've put it  
into a striking new catalog, with  
a wonderful array of proof. Get  
that catalog! It means success  
with poultry! Write for it to-  
day.

STANDARD  
Colony Brooder

Makes three chicks grow  
where one grew before, and re-  
moves the gamble from chicken  
raising.

Its use has ended the awful  
mortality of chicks, reduced op-  
erating costs for any number  
from 100 to 1000 to less than six  
cents a day; reduced labor to a  
fourth and hastened chicks to  
profitable maturity in less time  
than ever.

It's the most practical brooding  
device ever invented, simple,  
safe, sure, sanitary. Burns soft  
or hard coal, keeps fire 24 hours  
at one coaling, requires little at-  
tention. Write your own guar-  
antee—we will sign it.

Our catalog will absolutely  
convince you of its wonderful re-  
sults, told over their own sig-  
natures by delighted patrons, who  
have learned that there is such a  
thing as certainty in chicken  
raising, and who know that it is  
found in Buckeye quality and  
Buckeye service. Get that cata-  
log today!

## Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Testing Horses and Cattle

Does the law require horses and cattle to be tested or inspected for diseases when shipping from Los Angeles to Tulare County? If so, who does the work?—Subscriber, Whittier.

Make application to your county veterinarian.

### Making Will

If a person should wish to write his own will, is it necessary to employ attorney or to have witness?—Subscriber, Patterson.

One of the simplest documents to write and have legal is the will or testament, and no document has more trouble to get through the courts satisfactorily. It is not necessary to employ an attorney, although for so important a document it is perhaps wise, especially if the situation is in any way involved. Here is a short form given in the legal department by Attorney Payne in the columns of the California Cultivator of February 16, 1911:

"I.....give, devise, and bequeath to my wife.....an undivided one-half interest in and to all of my property of every kind and description wheresoever situated, during her lifetime, to have, use and enjoy the income therefrom during her natural life, and I hereby give, devise and bequeath all of the said property remaining at her death to my children equally." (Naming them.)

Mr. Payne added that it was not necessary to name the children, but it would be wisest to do so, that is, if there is no mention made of various heirs the courts might construe the matter as forgetfulness on the part of the testator, and that other heirs were entitled to a part of the estate. Where there are immediate heirs the names may be mentioned, and bequests of "love and affection" or \$1.00 or any other nominal amount showing remembrance of them would add to the security of the document.

### Bean Growers' Association

Where is there a bean growers' association which one might join in order to market his beans for a fair price?—Subscriber, Rosamond.

The Central California Bean Growers' Association has headquarters we believe in Sacramento. Would suggest writing to State Market Commissioner Weinstock, Sacramento, who can give information regarding that particular association. The California Lima Bean Growers' Association, while formerly exclusively dealing in limas, at one time considered enlarging its scope and taking in all producers of beans, so that, should you prefer, you might write this association at Oxnard, Ventura County.

### Salting and Curing Meats

What is the best method of salting and curing pork? — Subscriber, Etiwanda.

You will find an article in this week's issue on page 113 by Professor Cruess. We also refer inquirer to October 21, 1916 issue for an article on same subject.

### Warbles

Referring to our answer to question on the subject, "Grubs in Cow's Back" in the issue of the January 12, a Paso Robles subscriber writes:

"In your issue of January 12 a subscriber asks how to get rid of grubs or warbles. One application of sheep dip or mixture of that kind will do it. I used a dip called Caro Napholeum. One application killed the grubs. I made it strong, but I believe a weak mixture will do it. That is better than pressing them out which not only hurts the animal but is dirty work."

### Application of Lime

I was very much interested in the

article in your issue of January 5, "Lime, Its Value and Use," but there is one portion of it which I cannot see how it could be right, that is, under the subheading "Mining on the Farm," the last half of that part which says, "Sometimes hardpans are formed by the lime that has leached down, etc." The reason I do not understand that is that we often read, and under the subheading of "Physical Effect" this writer says "a small amount of lime will cause flocculation of clay, destroying adhesiveness, etc." If so I do not see how it could form hardpan as that is usually, if not always, formed in a clay soil. I am intensely interested in this as I have some hillsides which are a brownish clay, and the orange trees do not do much good on them, I believe because the soil is so compact that neither water nor air penetrate it sufficiently. I am considering liming it but do not want to make it any more liable to hardpan than it is as I consider it is the hardpan left after years of grain farming and particularly by the surface soil being washed away. Have also considered blasting it but think it would all run together again with the first winter's rain. It is surrounded by other orange trees so I cannot well plant anything else. I raise a cover crop of melilotus and burr clover every winter but it is not enough.—Subscriber, Whittier.

Dr. Snowden replies:

It is true that lime flocculates clay, rendering a stiff adobe more pervious to both air and water, thereby increasing the activities of the useful microorganisms and consequently improving the biochemic relations of the soil. Gypsum too possesses this virtue in a marked degree. When there is a considerable aggregate of lime carbonate in a soil and the rainfall upon it is light, the rain water containing, as it always does, carbon dioxide (in solution, carbonic acid) carries some of this lime as calcium bicarbonate, as far down as it goes; and if it does not reach the water table capillary action never brings it upward again. Evaporation inside the soil returns this water as vapor to the atmosphere while the lime remains below. This rise of moisture from the soil by internal evaporation is manifested in and proven by the hoar frost appearing on a cold winter morning in striated perpendicular columns, lifting a layer of the soil above it, and also as dew found under a board lying on the ground over night. Indeed, on account of the internal evaporation in the soil it is a fact that a meager application of water to the soil causes loss of soil water by increasing this evaporation. The continued repetition of the process of deposition of lime in the subsoil produces lime hardpan. In the humid soils the lime, instead of accumulating to form hardpan, passes into the drainage and is lost to agriculture. The hardpan of such a region is a combination of vegetable matter with the soil. Do not be afraid to put on lime if your soil needs it, for it is quite certain that not enough will be applied to form hardpan.

### Bleeding Walnuts

Have pruned a few of my walnut trees. They are bleeding badly. Will it injure, and should I continue the pruning?—Subscriber, Los Angeles.

The so-called "bleeding" of walnut trees has no effect on the trees other than to cause them to be a little later in putting forth leaves and blossoms in the spring, and sometimes this is a benefit if there should be late frosts. The flow of sap will be found strongest when cold nights are followed by warm days. If the weather is uniformly warm, both day and night, there will be no excessive sap flow, and the same holds true if the weather is cool. It is really never too late to prune walnut trees, but it is best to do heavy pruning before the buds open as there is less shock to the tree and no damage from breaking off new growth having the nut blossoms.—J. B. N.

YOUR LAD, AND MY LAD

Down toward the deep-blue water, marching to throb of drum  
From city street and country lane the lines of khaki come;  
The rumbling guns, the sturdy tread, are full of grim appeal,  
While rays of western sunshine flash back from burnished steel.  
With eager eyes and cheeks aflame the serried ranks advance;  
And your dear lad, and my dear lad, are on their way to France.

A sob clings choking in the throat, as file on file sweep by,  
Between those cheering multitudes, to where the great ships lie;  
The batteries halt, the columns wheel, to clear toned bugle-call.  
With shoulders squared and faces front they stand a khaki wall.  
Tears shine on every watcher's cheek, love speaks in every glance;  
For your dear lad, and my dear lad, are on their way to France.

Before them, through a mist of years, in soldier buff or blue,  
Brave comrades from a thousand fields watch now in proud review;  
The same old Flag, the same old Faith—the Freedom of the World—  
Spells Duty in those flapping folds above long ranks unfurled.  
Strong are the hearts which bear along Democracy's advance,  
As your dear lad, and my dear lad, go on their way to France.

The world rings out; a million feet tramp forward on the road.  
Along the path of sacrifice o'er which their fathers strode.  
With eager eyes and cheeks aflame, with cheers on smiling lips,  
Those fighting men of '17 moved onward to their ships.  
Nor even love may hold them back or halt that stern advance,  
As your dear lad, and my dear lad, go on their way to France.

—Rainald Parrish.

The Scourge of God

Germany's Business Is War, Paying As High As 10,000 Per Cent Profit.

The stories of oppression and cruelty by the Prussians in the present war have been so often questioned that, while there is no pleasure in the review, there is a satisfaction in knowing the truth. One of the best and most clean cut statements we have seen is that made by a noted divine, Newell Dwight Hillis, in an address at The War Convention at Atlantic City some weeks since.

WITH Germany, war is a national industry. Germany's agriculture pays six per cent. and finance pays eight per cent. Germany's war against Denmark, when she seized Schleswig-Holstein, paid her a thousand per cent. Her war in 1870 to grab the iron mines of Alsace and Lorraine paid her ten thousand per cent. Germany expected the war of 1914 to pay her twenty thousand per cent. "We have made no investment like our wars," said Bernhardt. "Let Belgium found steel plants at Namur and Liege—we will loot them. Let Nancy and Rheims and Arras fill stores with rich goods—and we will grab them."

This war had its origin in a meeting held in Potsdam Palace in 1892. On that occasion the Kaiser placed in the hands of his friends a confidential document; at the head of the document were these words: The Pan-German Empire. The second line read: "From Hamburg on the North Sea to the Persian Gulf." The third line was: "Our ultimate goal—by 1915—250,000,000 of people." The fourth line: "Our ultimate goal—the Germanization of all the people of the world." On the opposite page is a part of the Kaiser's address: "From my childhood I have been under the influence of five men: Alexander; Julius Caesar; Charles the Fifth; Frederick the Great; and Napoleon. All of these men dreamed their dreams of a world-empire—they failed. I have dreamed my dream of a world-empire—I shall succeed."

On the third page was a map of the old Roman Empire with Rome as the capital, Caesar Augustus as the war lord, and the once mighty states subdued, with Carthage and Jerusalem, Ephesus and Athens, reduced to the level of county seat towns. On the opposite page is the 1915-to-1925 world German map. Instead of the Roman Empire, you have the Pan-German Empire. Instead of Caesar Augustus, you have Kaiser Wilhelm II. And upon the countries once named: Russia, "Austria," "France," and "Great Britain," you have the word Germania, for Petrograd, Paris and London have become county seat towns.

The Kaiser told Ambassador Gerard that after this war was over, he would have no nonsense from the United States; by which he meant

that Germania would be written across our country with the "G" on San Francisco and the "A" on Washington. To win this goal, the Kaiser has bent every energy, he has turned his whole nation into one military machine with which to conquer the world.

War as a National Industry

In his textbook on militarism, Bernhardt speaks of war as "a national industry." A good business man builds his plant, organizes his workmen, and pays dividends of ten per cent. Not otherwise, Bernhardt shows the German people how to make war pay large dividends, partly through money tribute and partly through territory acquired. This German teacher on the science of war has proved that Germany has never made better business investments than in her wars. Her war with Austria in 1866 was a profitable investment, yielding Silesia as a dividend. Her war with Denmark was good business—it yielded Schleswig-Holstein and the hope of the Kiel Canal. Her war upon France in 1870 was most profitable—it paid \$1,000,000,000 in gold and the iron mines of Alsace and Lorraine.

It was in 1894 that the Kaiser and his associates first put into the hands of their leaders the Pan-German scheme, with its motto, "From Hamburg to the Persian Gulf." In 1911 the Pan-German Union published a second series of maps, with military and political plans, bringing up to date the scheme for a German Empire beginning at Hamburg and ending at the Persian Gulf.

The maps and plans as given out in 1894 run the German frontier line around Denmark, Holland, Belgium, the iron provinces of Northern France, the German province of North Switzerland; they make Austria-Hungary to be an ally state of equal rank with Prussia, but in the plan as published in 1911, the Kaiser places German military heads in control of the Austrian and Turkish armies, while the southern lines of the Pan-German Empire include all the Balkan States, the Kaiser's sister's state of Greece, with all of Asia Minor and Persia. So carefully was the plan wrought out, so perfect were the details, that today should the war close, as some wish, nine-tenths of all the Pan-German scheme would have been achieved.

I have in my possession an iron coin given as a token to each German soldier. At the top is a German portrait of Diety, and underneath are these words: "The good old German God." The Diety holds a weapon in his right hand; and the token bears these words: "Smite your enemy dead. The day of judgment will not ask you for your reasons." To this native characteristic Goethe was referring when he said, "The Prussian is naturally cruel; civilization will intensify that cruelty and make him a savage."

For three years German-Americans have protested that the stories of German atrocities were to be disbelieved as English inventions, Belgian lies and French hypocrisies, but that day has gone forever. On a battle-line four hundred miles in length, in whatsoever village the retreating Germans pass, the following morning accredited men hurried to the scene to make the record against the day of judgment.

#### Taking the Proof

The photographs of the dead and mutilated girls, children and old men, tell no lies. Jurists rank high two forms of testimony: the testimony of what mature men have seen and heard, and the testimony of children too innocent to invent their statements but old enough to tell what they saw.

The cold catalog of German atrocities now documented and in the government archives of the different nations makes up the most sickening page in history. These atrocities also were committed not in a mood of drunkenness, nor an hour of anger, but were organized by so-called German efficiency, and perpetrated on a deliberate, cold, precise, scientific policy of German frightfulness. The Germans slaughtered old men and matrons, mutilated captives in ways that can only be spoken of by men in whispers; violated little girls until they were dead; finding a calf-skin

nailed upon a barn door to be dried, they nailed a babe beside it and wrote the word "Zwei;" they thrust women and children between themselves and soldiers coming up to defend their native land; bombed and looted hospitals, Red Cross buildings; violated the white flag—while the worst atrocities cannot even be named here.

No one understands the German people as well as the Kaiser. Our President, in a spirit of magnanimity, patience, and good will, distinguished between the Kaiser and the Prussian government, and over against them put the German people. But Germany's Chambers of Commerce, Hamburg's Board of Trade, and certain popular assemblies, would have none of this, and in the fury of their anger passed resolutions, saying: "What our government is, we are. Their acts are our acts. Their deeds and military plans are our plans."

#### Personal Observations

During July and August, when I was in Europe, we went slowly from one ruined town to another, talking with the women and the children; comparing the photographs and the full official records made at the time with the statements of the poor, wretched survivors. In Gerbeville I heard the detailed story of a woman whose boy of fourteen was hung to a pear tree in the garden; and when the officer and soldier had left him and were busy setting fire to the next house, she cut the rope, revived the strangled boy, only to find the soldiers had returned; and while the officer held her hands behind her back, his assistant poured petrol on the boy's head and clothes, set fire to him, and while he staggered about, a flaming torch, they shrieked with laughter.

When they had burned all the houses and retreated, the next morning, the prefect of Lorraine reached that Gethsemane, and photographed the bodies of thirty aged men lying as they fell, the bodies of women stripped

and at last slain; while in the next village stood the ruined square belfry into which the Germans had lifted machine guns, then forced every woman and child—275 in number—into the little church and notified the French soldiers that if they fired upon the machine guns, they would kill their own women and children. After several days' hunger and thirst, at midnight, these brave women slipped a little boy through the church window, and bade their husbands fire upon the Germans in the belfry, saying they preferred death to the indignities they were suffering. And so these Frenchmen turned their guns, and in blowing that machine gun out of the belfry killed twenty of their own wives and children.

In a hundred years of history, where shall you find a record of any other race, who call themselves civilized, who are such sneaking cowards that they could not fight like men or play the game fairly, but in their chattering terror put women and little children before them as a shield.

During the January snows, a dear friend and noble surgeon, at the head of a hospital at the front, wrote me a letter which stays my heart as the anchor the ship in time of storm. The ground was deep with snow, many wounded men had been carried in from the field, but at midnight, when his work was done, the physician wrote me this letter:

"This war is of God. Sometimes it is peace that is hell. The soldier's life is a life of poverty, obedience, self-sacrifice; we know what the civilian's life is. But for the chastisement of this war, Berlin and Vienna, London and Paris, would have descended into hell within three generations. I once spoke in your church on the blessings of peace: if ever again I have that privilege, I shall speak on the blessings of war. I never dreamed that men could be so noble. For three months I have slept on the stone; for

three months before that in a tent; for six months I have not been in a bed; but I have never been so happy. I have acquired the fine freedom of a dog, and like a dog wear a metal tag around my neck so that they may know to whom I belong when it happens that I can no longer speak. And never was a man engaged in a cause so noble. I have seen Belgium; I have seen a lamb torn by the wolf; I am on the side of the lamb. I know the explanations the wolf has to offer—they do not interest me. I only wish you were here with me at this battle for your own good; for right here at this western front this war will be decided, just where all the great wars of history have always been decided. It is decided already, but will take the enemy some time yet to find it out."

#### CAN YOU HANG YOUR OWN SKIRT?

Written for California Cultivator  
By Ruth Dougherty

You can do it. It sounds too good to be true, but it is. This is the way: Take a common yard stick, a piece of tailor's chalk and a sharp knife.

Cut a wedge shaped piece out of the edge of the yard stick, of a size to fit the piece of chalk when it is slipped in with the broad edge next the stick. This cut for the chalk may be made where convenient for the user, for myself I make it at the 27 inch point.

Now to hang the skirt! Place end of yard stick on floor, holding carefully in vertical position, with chalk marker next your skirt. This brings the marker below the swell of the hips. Mark skirt with chalk; move a few inches, mark again; move along farther and mark; continuing all around the skirt, being careful to keep end of stick vertical, so that your chalk line will be at an even distance from the floor all around the skirt.

Now take skirt off and lay on bed or table. With your yard stick measure down from the chalk line and mark with chalk line for turning hem.

## UNION **Lee** MADE Union-Alls TRADE MARK REG.

**FARMERS** everywhere are insisting on **Lee Union-Alls** when they purchase work clothing. The new suit is so much more practical and comfortable than the old fashioned overalls and *more economical*, too. No loose ends to catch in things, no suspender straps or binding belts. The suit covers you from neck to feet, keeping out dust, dirt and chaff. You slip it on in a jiffy either over your regular clothing or your underwear. Triple stitched seams, riveted buttons, reinforced strain points—workmanship the best, material the strongest. If your dealer does not supply you we will send your size direct. Write for descriptive booklet, telling us your chest measure and material desired—Blue Denim, Khaki, Stifel Stripe or Hickory Stripe.

#### THE H. D. LEE MERCANTILE CO.

Kansas City, Mo.  
Salina, Kas.  
Trenton, N. J.

Kansas City, Kas.  
South Bend, Ind.  
San Francisco, Cal.

**Please Remember:** There is only one UNION-ALL—the LEE. The use of the name by manufacturers or retailers is an infringement. Look for our trade-mark stitched on the back of each garment. Look also for its triple stitched seams.

RIVETED STEEL BUTTONS

TRIPLE STITCHED SEAMS

REINFORCED STRAIN POINTS

For instance, if you wear your skirt six inches from the floor and your chalk marker is 27 inches from the floor, you will measure and mark the hem 21 inches from your first chalk line.

Now run basting thread through your chalked hem line; turn up hem and press and your skirt is all properly hung and ready for the regular hemming and you can wear it with the serene consciousness that it's straight around the bottom.

Does it sound a bit complicated? Try it and you'll find it simplicity's self. It really takes less time and bother than the time honored method of having somebody else get down on the floor before you and mark with many turnings and sightings from across the room. Then you can do it at just the minute you are ready, without waiting until somebody else can conveniently do it.

With our straight, narrow skirts coming back in style the hanging is very easy.

Tailor's chalk, by the way, is an indispensable. Two pieces, that will last for years, may be purchased at two for a cent and may be used for marking length of skirt, of sleeves, outlining cut for neck, for arm's eyes, marking button holes, tucks, oh! ever so many things—in fact it's almost as useful as a pin.

#### LEFT-OVER RICE

Although rice has remarkable food value, it has little individual taste and so takes on the flavor of the dish with which it is combined. This quality makes rice an excellent foundation for milk and cheese dishes, or combination with meat, chicken and fish in stews. Rice can be combined with any vegetable, made into a variety of desserts, used to thicken soups or mixed with wheat flour or cornmeal in bread making. Even a spoonful left over can be stirred into bread, mixed in chicken stuffing or dropped in the soup pot. Left-over rice may be browned in fat for breakfast or made into cakes by adding an egg, a little milk, flour to thicken and a teaspoon of baking powder. These rice cakes are delicious with syrup.

#### Rice Cornbread

Cooked rice can be used in any cornbread dough. It adds lightness to the bread. From the rice growers of Louisiana comes this recipe for rice cornbread:

Three eggs, one pint milk,  $1\frac{1}{2}$  cups boiled rice,  $1\frac{1}{2}$  cups cornmeal, two teaspoons fat, one teaspoon salt, one teaspoon baking powder. Beat eggs very light, add milk and other materials. Beat hard and bake in shallow greased pan in hot oven.

#### Rice Hash

Put in a pan one cup each of boiled rice, cooked meat cut fine, and hot water. Season with one teaspoon each of salt, chile pepper and chopped onion. Boil 15 minutes.

#### Baked Hash of Rice and Meat

Put in a stewpan one cup each of chopped meat, cooked rice and milk; two tablespoons of fat, one teaspoon of salt, one-fourth of a teaspoon of pepper. Stir for one minute, then add a well beaten egg. Turn the hash into a baking dish and bake 20 minutes.

#### Roast Goose or Duck Stuffing

Four onions, four apples, four leaves each of sage and thyme; fry these in two tablespoons of fat till brown; add boiled rice until of a desired stiffness. Season with salt, pepper and cayenne.

#### Codfish Balls with Rice

One pint of codfish, two pints of

potatoes, one cup of boiled rice, one tablespoon of fat, two beaten eggs, three teaspoons of milk. Mix together and make into balls and fry in deep fat. Serve hot.

#### Rice Stew

Boil together one can of English peas, one-half cup of rice, one teaspoon of salt, pepper to taste, one tablespoon of fat and one cup of sweet milk. Thicken with flour. Serve very hot in a hot dish. Cover the top with grated cheese before sending to the table.

#### CONSERVE COTTON

That nearly a bale of cotton is used every time a big gun is fired and that according to government reports there are 500,000 fewer bales of cotton this year than last, is the declaration of the women's committee of the national and state councils of defense in a plea made today for the careful conservation of all cotton products. Attention is called to the practice of using good towels, table cloths and napkins for scrubbing rags, for polishing metal and for other purposes which destroy their usefulness. The daily call from the Red Cross for material for surgical dressings and bandages is becoming heavier each day, and the available cotton supplied will soon be

needed for these purposes. Housewives and others are urged to make both cotton and linen products last as long as possible.

#### THEN SHE SAW STARS

Booth Tarkington was talking in Indianapolis about the stage. "There were two actresses in an early play of mine," he said, "both very beautiful; but the leading actress was thin. She quarreled one day at rehearsal with the other lady, and she ended the quarrel by saying haughtily: 'Remember, please, that I am the star.' 'Yes, I know you're the star,' the other retorted, eying with an amused smile the leading actress' long, slim figure, 'but you'd look better, my dear, if you were a little meteor'."—San Francisco Argonaut.

#### USELESS ECONOMY

"Economy has it pains as well as its pleasures," says a Washington preacher, "if the experience of an old dorky of my acquaintance in Virginia counts for anything.

"One spring, for some reason, old Mose was going round town with a face of dissatisfaction. When questioned, he poured forth a voluble tale of woe in these terms:

"Marse Tom he come to me last

fall and he say: 'Mose, dey's gwine to be a hard winter, so yo' be keeful and save yo' wages fast an' tight.

"An' I believe Marse Tom, yassuh. I believe him, an' I save, an' when the winter come it ain't no harship, and dere I was wid all dat money thrown on my hands."

#### PUNISHMENT WITHOUT CAUSE

An irascible father administered a sound thrashing to his son Samuel. After he had finished he thundered to the suffering victim:

"Now tell me why I punished you!"

"That's just it," sobbed Sammy "You nearly pounded the life out of me, and then you don't even know why you did it!"

#### NO OUTSIDE HELP WANTED

"What is your idea of patriotism?"

"Patriotism," replied Senator Sorensen, "is what inspires a man to point out many needs for reform in his country, but causes him to resent an indorsement of his views by a foreigner."—Washington Star.

#### BULL'S EYE AGAIN

"Why on earth don't men settle down after they marry?" complained Mrs. Gabb.

"Because their wives won't quit stirring them up," retorted Mr. Gabb. —Cincinnati Enquirer.

*If it isn't an Eastman,  
it isn't a Kodak.*

Every article of real merit sells best under its real name.

If it is genuinely good the salesman has no reason to camouflage its identity by giving it the name of a competing article.

When you ask at the store for a Kodak camera, or Kodak film, or other Kodak goods and are handed something not of our manufacture you are not getting what you specified, which is obviously unfair to you.

"Kodak" is our registered and commonlaw trademark and cannot be rightly applied except to goods of our manufacture.

ers at shipping points.

## HAY

Under date of January 26, Scott, Mag-  
ner & Miller says:

Receipts past week, 1954 tons. Cars  
have been a trifle easier and more hay  
is arriving for general requirements, gov-  
ernment receipts being very small, show-  
ing that the orders placed by the quar-  
termaster's department are practically filled.  
The market in this city has been easy,  
with trade light, in the country districts,  
better, and much hay has moved to sec-  
tions south of San Francisco where they  
must have it to feed cattle.

Also first-class Orchard, Bean and Sugar Beet land. Twenty acres and up with  
easy terms of payment.

**BRENTWOOD IRRIGATED FARMS,** In Contra Costa Co., 63 Miles from San Francisco  
For Price and Descriptive Matter Address

BALFOUR, GUTHRIE & CO., LAND DEPT., 350 California St., San Francisco

Rye, Utah ..... 4.00@4.25  
Wheat — Government prices: Common white hard, base price is \$3.50 per cental, or \$2.10 per bushel of 60 pounds delivered in terminal warehouses in bulk; soft wheat, base price 2 cents per bushel less, or \$2.08 per bushel; white club (including Sonora), \$2.06 per bushel. If wheat, after cleaning, weighs 60 pounds or more to bushel, base price stands; if 58 to 60 pounds to bushel, 3 cents per bushel reduction; if 56 to 58 pounds, 6 cents per bushel less; if less than 56 pounds, grain becomes sample grade and sells on its merits up to within 1 cent per bushel of 56-lb. wheat. Sacked wheat 4 cents per bushel more, less tare for weight of sacks.

**FEEDSTUFFS**  
These prices applicable to San Francisco, with \$1.00 less at Sacramento and Stockton, are for cash at the mill in carload lots, and include sackage, with an additional rate of 50 cents per ton in less than carload lots.  
Wholesale prices per ton. Prices fixed by food administration as San Francisco price; Sacramento and Stockton \$1.00 less on carlots at mill door:

Alfalfa ..... 20 @ 21  
Flax ..... 6 @ 6 1/2  
Rape ..... 2 1/2 @ 3

**Citrus Fruit Market**  
Los Angeles, Jan. 30, 1918.  
It has been a week of uncertain weather and uncertain demands. There is a large quantity of fruit injured in transit which has somewhat affected the market, but some sales at long prices have been made as stock was strictly fancy. Lemons have shown prices ranging from less than freight to \$7.00.

**Shipments**  
Shipments of citrus fruits from California since November 1, 1917, Southern California: Oranges, 3079; lemons 709; total, 3788. Last season same date: Oranges, 4831; lemons, 1191; total, 6022. Central California: Oranges, 1865; lemons, 95; total, 1960. Last year, same date: 3938, oranges; lemons, 140; total, 4078. Northern California, this season: Oranges, 202; last year same date: 824.

\$5.80, Lem. \$2.15-\$4.35.  
Philadelphia: 1 Val. \$1.55-\$2.95.

**MARKET NOTES**  
Reports from the San Francisco market are in effect that bean-growers and bean handlers are confronted by a gloomy situation. However, federal purchasers say the situation is not so serious as it was and buying throughout the entire country is showing slightly more life. The federal buyers say: "The government continues to buy its supplies at fair and reasonable price. Quite recently the navy department commandeered at lot of lima beans in Southern California, for which it paid a price somewhere under the market, but one which showed the growers a considerable profit." In connection with this we may add that the federal agent who made the statement added: "With regard to both quality and condition, California beans are better than can be secured anywhere else in the world. They are finding a market and shipments are being made on account of this splendid condition and quality."  
Hawaiian bananas are arriving at San Francisco in large quantities.  
Petaluma is shipping a carload of eggs to New York City every day this week, and it is expected some days will see two cars going forward. In spite of these heavy shipments prices were forced down; in one day nearly eight cents per dozen, this because of heavy slump in the East.

# How long will it run?

and what kind of service does it give you while it is running?

These are the questions:  
You are not so much interested in how fast it will run —but how long it will run —how long it will last on your work?

## —Test Special Belts

—last and run and do their work well for years—it depends on the kind of work. Some belt users buy cheap belts made of short fibre cotton and shoddy rubber — consequence : they last a few months—maybe not a whole season.

You can't throw money away faster than to buy that kind of a belt—besides, when it fails to do your work the need may be greatest. Buy a Test Special belt in the first place—it lasts for years. Write us.

**BELT TROUBLES:** Do you have any troubles with belts? We are belt engineers. Send us a rough drawing to indicate how your belt is operated, and tell us your troubles. We'll cheerfully help you solve them—FREE.

YOU wouldn't feed a baby on "vittles" that satisfy a grown-up—would you? Then—why take chances, why experiment with the feed you give your baby chicks? Start 'em off right—that's the main thing. Give them Sperry Gritless Baby Chick Feed. Because—they thrive on it. It gives them a firm foundation on which to build *your* future profits.

It is clean, uniform, properly granulated and proportioned for the delicate organs of the baby chick. It contains the exact food values and constituents Nature provided for this purpose.

That's why thousands of chicken raisers are enthusiastic about it. They have proved that chicks fed—from the very start—on Sperry Baby Chick Feed develop into sturdy, healthy chickens.

Our booklet, "*Makes Hens Happy*," explains how you can prove this to yourself—tells how to increase your poultry profits. Send for it today—it's free.

## New Harvest Economy and Profit

**W**ESTERN farmers, always on the watch for improved equipment to save time and money in getting the crops off the fields, are paying a lot of attention to **Deering Harvester-Threshers** these days. Many of them have bought and are using these efficient machines. Their success and enthusiasm means a big advance in rapid harvesting this fall.

Modern grain handling means harvesting and threshing in one operation, turning the threshing expense into clear profit, doing away with the big threshing bill and burden, saving time and long-drawn-out labor.

The **Deering Harvester-Thresher** is a Western necessity. Get acquainted with it. The **Deering** cuts a 9-foot swath, harvests 15 to 18 acres per day, and threshes clean as any thresher. Requires 8, 10, or 12 horses, and one or two men, depending on attachment used. In most cases, an International kerosene tractor can be used to best advantage.

The **Deering** has proved that it is designed and built right in every particular—strong and lasting, simple, of light draft. It can be used as a stationary thresher, too, by adding cylinder and beater pulleys, which are supplied at extra cost. A 10-h. p. engine does the work. Capacity 30 to 50 bushels of wheat per hour. Write us for an interesting folder on the **Deering Harvester-Thresher**.

## Kill Squirrels Gophers

The only exterminator that is 100 per cent efficient and guarantees results or money back, is

**KILMOL**  
**SQUIRLGOPHENE**

It contains special chemicals. **Kilmol** fumes not only asphyxiate the squirrel or gopher, but eat away their lung tissues. Even should the animal reach fresh air, he can't survive. No other exterminator is as effective as **Kilmol**. That's why **Kilmol** costs a little more—but economy in labor warrants the advanced price. For best result use prepared waste balls saturated with **Kilmol**.

New formula of U. S. Government Poisoned Barley is effective in dry weather. **Kilmol** and U. S. Government Poisoned Barley are used and endorsed by the biggest and most successful ranch owners.

Remember, results guaranteed or money refunded.

Your local dealer carries **Kilmol**, Waste Balls and U. S. Gov't. Poisoned Barley.

## May Be a Crop for Waste Lands

Castor Bean Crop Still Discussed and it Appears That the State Will Produce Some for Federal Use. Not a Crop for Small Farmers but Planted in a Large Way May Help to Meet the Nation's Need

**T**HE Cultivator has been accused of being pessimistic as to castor beans being a profitable crop under California conditions, and until this week we have been unable to get any definite information as to government desires in this matter. Now it appears there is a demand for the oil in excess of present supply. Oklahoma and other states will plant largely, and the price suggested as one which will prevail for the coming crop is \$3.50 per bushel of 46 pounds, this to the contractor. The contractor is to sublet

beans on by means of horses. Care was exercised to keep a good thick layer of plants under the horses feet; the yield was from 1200 to 1400 pounds to the acre."

The Globe Milling Company of Los Angeles, which has for sometime been expressing quantities of oil from soy beans, may turn its attention to castor beans. We have asked as to contracts, and have the following:

"Regarding castor beans: The variety which is grown wild in this section seems to present interesting possibilities. We hope in the very near future to be able to demonstrate whether they can be pressed for oil

b. nearest railroad point to point of production. Government will furnish seed at cost, plus transportation charges, to be paid for in cash or out of first sales to the government as the contractor desires. Payments by government will be made on delivery."

"The above quotation is from a circular from the signal officer of the war department. We have a wire under date of the 14th from the war department saying that the government is contracting with responsible planters for growing castor beans. It is desired to plant approximately 5000 acres in Southern California, and is

er Mills of Butte County as having cultural information which would be of value to those contemplating growing castor beans, we wrote him and received his answer in effect that he had not seen the articles in question and knew nothing regarding the present campaign. He adds: "The only dope I have on this topic is that which I obtained about five years ago. At that time I had a brother living in Ventura County who wrote me and sent samples of castor beans which were growing in a semi-wild condition in a certain portion of that county. These apparently had been planted ten to 15 years previous, but the property owner finding no remunerative market for this crop had let them grow wild. My brother said he could obtain many tons of these beans merely for cost of harvesting, and was of the opinion that he could put a crew of men in gathering these beans and find a fair sale for them. But upon looking into the matter very carefully I found that although he would only be out the cost of harvesting that he would not be able to sell the crop for more than cost of gathering and in consequence advised him to let them alone.

"It is possible that the war may make a good market for castor oil during the next two years, but certainly no one could plant castor beans now and get much tonnage prior to the termination of hostilities, at which time the market doubtless would become sluggish as before."

If castor oil is needed in the operation of airplanes or any other equipment employed by the government, Californians may well consider it advisable to grow them, even if at a loss, but the fund of misinformation which has been given through the daily press is so extensive that the Cultivator feels it wise to warn producers of some of the factors to be considered, such as cost of harvesting, cost of removing stumps, possible limited demand and the further fact that castor beans are not a food staple.

On good California irrigated lands from an income standpoint staple foods would surely prove more profitable, but that our growers may have all the knowledge we can secure for them on the castor bean question we add a few cultural suggestions in addition to those contained in the Cultivator of January 26.

Prof. Rolfs of the Florida experiment station suggests that land preparation should be same as for other field crops; rows six feet apart, hills four feet apart in the rows. In planting drop two or three seeds to the hill. When six inches tall remove all but the most vigorous plant. The Indian bean runs about 1200 to the pound; the Kansas variety doubles this number. A bushel of the Indian variety will plant about nine acres. A corn planter is used. Ordinary cultivation of southern field crops is given in Oklahoma.

We may add that instructions give

Scene at the National Orange Show, San Bernardino

Bowers and Flowers and Beauties as they have appeared at other shows. We are assured this year's National Orange show will be the equal of any. The dates are February 20-28. This is Riverside's exhibit, 1917. This year she comes with a great battleship.

on contracts calling for around \$3.00 to the producer, for clean seed delivered to railroad. Henry S. Gane who assures us that he has contract for 5000 acres to be grown in California says that the yield is from 1200 to 1400 pounds per acre. Mr. Gane writes:

"About 40 years ago nearly 150 acres were grown in the Carpinteria Valley of Santa Barbara County. It was grown on what is now Lima bean land. The castor beans were planted about May 1 and the crop harvested in November or December. The plants were cut by hand with a sort of long handled hook, a man cutting two acres a day. The cut plants were then thrown in large piles and allowed to dry the same as Lima beans are. When dried a large canvas about 40 feet square was used to thresh the

without removing the outer hulls.

"There is a big demand for this oil for lubricating purposes. We are of the opinion that \$100 a ton for the beans hulled, delivered at the crushing plant, would be a conservative value to figure on. It might be possible to pay more, but we would not care to contract now for next fall's delivery."

We wrote Commissioner Hecke and from him have a copy of a letter which he had received from the state council of defense, signed by Vice Chairman Naftzger. From this letter we quote:

"I have to say that the government is prepared through the war department:

"To enter into contracts for the production of castor beans, guaranteeing \$3.50 per bushel of 46 pounds f. o.

not advisable to contract for less than 100 acres.

"Now, we have been endeavoring to get some information upon this subject and the indications now are that we are likely to find that castor beans ripen slowly and irregularly and that they are gathered by hand in the course of several pickings over the same ground.

"If this be true, it would be rather expensive, in view of the fact that labor is likely to be very difficult to get. However, we expect to have more information upon this subject."

Mr. Hecke adds: "It would appear to me, from the figures given in the enclosed letter, that castor bean culture would hardly be profitable in this state."

Sacramento Valley papers, having referred to Horticultural Commission-

# ONE MAN CULTIVATES TWO ROWS AT A TIME *with the*

## MOLINE UNIVERSAL TRACTOR *"It Solves the Farm Help Problem"*

More time is spent in cultivating than any other single operation. Sixty per cent of the crops grown on most farms are planted in rows which require cultivation.

If one man is to farm more land than ever before, he must also cultivate more. With the Moline-Universal Tractor one man cultivates two rows at a time and does it better, quicker and cheaper than with horses.

The Moline-Universal Tractor has ample clearance to straddle the corn row at all stages of growth. The operator sits on the cultivator in line with the right drive wheel of the tractor—not directly behind the tractor. This gives a clear view of the rows ahead. By keeping the right wheel of the Moline-Universal a certain distance from the outside row the whole outfit will go properly. For dodging individual hills the cultivator gangs are easily shifted by the operator's feet.

But cultivation is only one of all the farm operations which the Moline-Universal can do. It is light, but has more than enough power to pull two 14-in. plow bottoms, because all its weight is available for traction.

The Moline-Universal isn't the kind of a tractor that will do your plowing and seed bed preparation and then rest while your horses do the planting, cultivating and harvesting. It works to full capacity throughout the entire year with the greatest speed and economy.

Your Moline-Universal is ready now. Write today for further information and name of your nearest Moline dealer.

Address Department 49

MOLINE PLOW COMPANY, MOLINE, ILL.

## Farm for Profit

### and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

## MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

## HAUSER PACKING COMPANY

9th and Mateo Sts. PHONE 10336—Bdwy, 5600 Los Angeles, Cal.

different distances; some preferring three by four feet, others, four by four, others five by five.

Again from a circular compiled by Mr. Gane we quote:

"A specially constructed machine is necessary for threshing the varieties which do not 'pop' by mere drying in the sun. In a homemade machine used in Oklahoma cylinders or rollers were so adjusted that the pods, when fed in a thin stream between the rollers, were crushed and the beans dropped out uninjured. A fanning mill is used to remove the hulls, chaff and

dirt from the beans, which are then sacked and stored ready for market.

"Estimates of yield vary greatly. In Oklahoma the average yield of the 'popper' variety is said to be 8-10 bushels per acre; that of the India variety, about 20 bushels per acre. Yields of 30-40 bushels per acre have been reported from California, Florida and Texas."

Under the contracts which the government contractors are making it is stipulated that the imported seed is to be used in planting. This seed will be furnished by the government, price not yet announced.

## Freak Weather

No Two California Winters Alike

No Two California Summers Different.

**C**ALIFORNIA optimists are chasing through weather reports of past years, hoping to find rainfall records, or rather drouth records, of the early part of the season which may encourage the hope that the latter part of the season may afford us a fullness of wetness.

Pessimists, on the other hand, are looking through the records expecting to show proof that we are doomed to a dry season. Both are succeeding, for California has had sufficient variety of seasons to enable us to prove almost anything. We are not certain, but we think it was Van Dyke who stated that California could be depended upon to show that it had no two summers different and no two winters alike.

When the season is over we will know as to its wetness. Meantime we are hoping the optimist will be the winner.

A bit of information is to be found in looking through old reports of the department of agriculture, and while engaged in this interesting pastime, we found, in the report of 1878, an article by Eugene W. Hilgard as to agriculture and soils of California. It covers many pages and is wonderfully interesting. From that portion of it touching upon the diversity of local climates up and down the state, upon its two seasons, and more particularly upon its rainfall, we quote:

When, moreover, it is understood that in a large portion of the region under consideration the average annual rainfall barely comes up to the minimum of ten inches estimated to be necessary for the growth of a crop, while in most of the remaining portion the average does not exceed (except locally) twice and a half that minimum, it will be readily conceived that the California farmer watches the rain-guage with the same feelings with which the Egyptian regards the nilometer; and as the latter counts his seasons by Nile-inundations, so the California farmer reckons his time by "seasons" instead of calendar years. It is of comparatively little interest to him how much rain has fallen from January to January, as exhibited in the usual form of meteorological tables; for the 40 inches of rainfall so shown as the aggregate of two consecutive years may have been so distributed as to leave him "high and dry" during one growing season, with an excess for the other.

In order to exhibit the "fat" and "lean" years of California, it is necessary to tabulate or plot the rainfall by "seasons"; and after some unsuccessful attempts to connect their recurrence with the 11 year period of the sun spots, a discussion of the observations of 28 years now on record, Prof. G. F. Becker of

the University of California seems to show the existence of a 13 year period between consecutive minima, the second minimum within the time of the American occupation having occurred in the season of 1876-77, with a rainfall of only 10 inches at San Francisco, where the average is 23½ inches; while in some portions of the upper San Joaquin Valley, as at Bakersfield, as well as in the region of the Mojave Desert, there was not rainfall enough to start vegetation at all, and no ground not irrigated was broken that season. In the autumn of 1877 much of that region resembled a well-swept barn floor. There is an Indian tradition that at one time toward the end of summer water was only found in pools in the Sacramento River, so little snow having fallen the previous winter that all streams ceased to flow. From information kindly furnished me by H. H. Bancroft, Esq., of San Francisco, it appears that in the records of the early explorers of California, the year 1805 is known as the "hungry year," the drouth having been extraordinarily severe; and nearly the same account is given of the year 1817. It will be observed that these dates indicate a period of 12 years between themselves, and that the interval from the latter date to 1877—for those drouth years as yet no date have been found—is also divisible by the same number. It is quite intelligible that as the result of several concurrent causes the period may vary between such limits as 12 and 13.

It has been suggested that a study of the growth rings of the ancient Redwoods and Sequoias might lead to the recognition of the laws governing the seasons through past ages, it being probable that the dry years would be represented by a smaller growth than the wet ones. Unfortunately, it appears that in California, as well as in other countries where there is no well defined season of rest for vegetation, the formation of several growth rings within the year is of frequent occurrence, so that even the estimate of the age of the great trees is thereby materially vitiated. I have seen on the face of a redwood plank eight feet wide groups of three, seven, 12 and even 30 closely contiguous rings, occupying spaces but little larger than the intervals between two rings elsewhere, making it appear clearly that the unravelling of their record requires more than mere counting and measuring. But whatever may be the precise period in general, the fact that the average rainfall in so many regions nearly approaches the minimum required for any crop, gives exceptional importance to the minor or annual as well as local variations of its amount and distribution. It thus happens that in each region experience has shown a certain average ex-

pectation of successes and failures of unirrigated crops, which is taken into account by the farmer in his calculations. It is not, of course, easy to obtain perfectly impartial figures in this regard, the more as each valley may differ from its neighbor, and differences of crops, cultivation and soil come in for a large share of influence. Besides, the shortness of rainfall during one "season" may be materially supplemented and fair crops made when the preceding season has been one of abundant rain, it being popularly said that there is a chance for a crop whenever the moisture rising from below and that coming from above have met. This naturally happens much sooner in land kept tilled than in such as has been left to crack open, giving free access to the hot dry air of summer. In such soil in the San Joaquin Plains no perceptible moisture is to be found at depths of three and even four feet at the end of the dry season, while in deeply tilled land it may be reached at 12 or 15 inches. Again, a slow and gentle falling of a small amount of water will do as much good as a larger amount falling violently and largely draining into the streams; while, on the other hand, a few days' prevalence of a dry "norther" may completely wipe out the effect of spring showers that otherwise would have turned the scale in favor of the producer.

### BOASTING UNDULY

The spirit of the little kid who says; "My orange's better'n yourn" persists when he grows older, and the commendable California spirit which boosts for its own community is worthy further encouragement providing the boosting is within reason. The boosting for ourselves and the tearing down of "just over the line there" has been fairly well eradicated from California real estate methods, but we still will brag as to our own little community, and in the matter of oranges each little community is doing the best and each had the least injury and each has "the biggest" orange of all. The following is from the Riverside Press:

There has been quite a lively discussion regarding returns received on the first few cars of navels shipped from the Riverside district this season; and without undertaking to settle some of the points raised or indulging in any "invidious comparisons," the Press at least can safely say that the prices have been such as to bring joy to the heart of the grower who has any fruit. One private shipper in a confidential letter to the Press takes up another phase of the matter and discusses the tendency to report f. o. b. sales in such a way as to mislead the grower as to the amount of money he is to receive. In part he says:

I find a number of shippers, including the exchange, mislead the grower and mislead everybody in connection with the average business on prices. I have it on what would appear to be reasonable authority that today the exchange is quoting 64s and 80s at \$2.25, 96s at \$2.50, 100s at \$2.75, 126s at \$3.50, 150s and smaller \$4.25.

Now, this is the general quotations, yet they tell their growers that they are selling for \$4.25 f. o. b. You take the average car and figure it out size for size, and they are getting around \$3.00 to \$3.25 f. o. b. The first car I shipped I sold for \$3.75 f. o. b. straight. Figuring it out on the exchange prices, I would have received \$3.40 f. o. b.

It is misleading the growers to tell them that they are selling at \$4.25. It

## TEAGUE QUALITY CITRUS TREES

AWARDED THE GOLD MEDAL AT FOUR INTERNATIONAL EXPOSITIONS.

For Productive values, fine quality of fruit and vigorous growth Teague's bud-selected, (pedigreed) properly trained and carefully handled orange and lemon, pomelo and lime trees are the trees to plant. An experience covering a third of a century warrants the assertion that Teague Quality Citrus Trees possess these qualifications in a superlative degree. All the standard commercial sorts, and garden and ornamental varieties; the largest assortment of citrus trees in America. . . . We invite correspondence from intending planters. . . . Consultations on citrus planting by appointment. 1918 Price list just out; send for a copy.

is misleading the public in general  
when they say they are selling at  
\$4.25. While it is true, they are not  
telling but half the truth, and it is go-  
ing to cause a good many sore spots  
when people go to get their money.

The same sort of criticism has been  
made to the Press by growers in Riv-  
erside. They have claimed that some  
shippers, in the exchange and outside,  
give out figures of the highest price  
received for fruit in a given car. No  
mention is made of the number of  
boxes which sold at that price; and in  
some instances the fact was that this  
top notch price was for only a few  
boxes of selected fruit. The total net  
return from the car and therefore the  
average price per box was no more or  
even less than that received by other  
shippers who refrain from the prac-

tice of slipping in a few boxes of more  
than "extra fancy" fruit. Of course  
these exceptionally high sales have a  
certain advertising value, but the fair  
and sound method of figuring returns  
is a basis that takes into account all  
grades and all sizes and gives the to-  
tal returns for the car.

The Press is very sure that what-  
ever criticism is coming regarding any  
of these methods of "padding the re-  
turns" should extend to private ship-  
pers as well as the exchange; and  
there is certainly difference of policy  
among various associations within the  
exchange. In the long run, however,  
the best policy is one of frankness  
that gives the grower information re-  
garding his returns on all the fruit he  
delivered at one time and not on a few  
boxes only of some particular size or  
extra fancy pack.

## Raisin Association Saved

**Strenuous Fight for New Contracts With Raisin Growers Successful and  
85 per cent of Raisin Acreage Now with Association.**

ERE it is officially, after a  
hard campaign extending  
over months:

February 1, 1918.

Fresno Clearing House Asso-  
ciation, Fresno, Cal.

Gentlemen—The crop contracts de-  
livered herewith to you, together with  
those previously delivered, number  
6980. They represent 131,530 acres of  
Muscats, Thompson, Sultan, Malaga  
and Feherzagos vineyard. This  
acreage is well over the 125,000 acre  
minimum required by our agreement  
with the signers, and you will, there-  
fore, please see that the contracts  
are delivered to the proper parties as  
soon as practicable. Yours very  
truly.

California Associated Raisin Company.  
by Wylie M. Giffen, President.

In addition here is a personal state-  
ment by President Giffen:

"It is, of course, with great pleasure  
that we announce the success of our  
campaign for 125,000 acres. The fig-  
ure given out by the Clearing House  
Association was 131,530. Our experi-  
ence in other campaigns has been that  
many contracts came in after the date  
set for closing, and undoubtedly the  
amount will be increased by these  
contracts within the next few days.  
We will not go into figures at this  
time, as our records are not complete,  
but undoubtedly we have better than  
85 per cent of all the raisins grown  
in California.

"Unquestionably we now have the  
strongest control we have ever had,  
and under the new contract the start-  
ing point is the lowest, as we lose  
nothing by the transfer of places, and  
every contract we now get adds some-  
thing to the percentage, whereas, un-  
der the old contract the starting point  
was the highest, as we continually  
lost more through the transfer of  
places than we were able to gain  
through our solicitors.

**Contracts Uniform**

"Even those of us who have been  
in close touch with this campaign  
hardly realize how much has been ac-  
complished. Our thoughts have been  
centered alone on the 125,000 acres,  
and though that is important it is not  
nearly all that has been accomplished.  
There are in the state of California  
10,000 growers scattered all the way  
from Marysville to San Diego. Of this  
number approximately 8500 have sign-  
ed our contract, and there has not  
been a single one in that whole num-  
ber that has a more favorable contract  
than every other one. We have un-  
doubtedly lost a few contracts by  
what some people think were arbi-  
trary methods, but it is a great source  
of satisfaction, and we believe, too,

has been a great source of strength in  
the campaign to be able to say to ev-  
ery one that there were no favors be-  
ing shown in the taking of these con-  
tracts. Not a single option has been  
stricken out, not a single contract has  
been taken that did not run with the  
land and not a single promise has  
been made to any individual that is  
contrary to the general policy that ap-  
plies to all.

**Stock is Increased**

"The contract itself guarantees to  
the stockholders eight per cent earn-  
ing on the money actually invested  
for the next six years, and by a sim-  
ple clause the stock is automatically  
increased from \$1,040,000 to \$2,500,000  
or \$3,000,000 in the next three or four  
years, and this in such a way that  
some stock goes into the hands of ev-  
ery grower without his feeling the  
burden at all. This increased stock  
will enable us to provide adequate  
packing facilities to handle the crop  
without the congestion and delay that  
has prevailed in the years past, and  
at the same time make to the growers  
who own it an earning of eight per  
cent.

"Our own solicitors are entitled to  
special commendation for the thor-  
oughness with which they have done  
their work, but the success of the  
campaign can only be attributed to the  
fine public spirit and excellent team  
work by which they have been sup-  
ported. In fact, an organization of  
this kind can only be a success when  
supported by the confidence of the  
public, and the moment it ceases to  
merit such support will be the begin-  
ning of the end. From this point of  
view this has been the most success-  
ful campaign that we have had, and  
without a single exception every  
civic organization, the ladies' clubs,  
the growers' committees and literally  
thousands of individual workers from  
every calling of life have done their  
part. So many have done noteworthy  
work that it would be impossible to  
pick out for honorable mention any in-  
dividual. Even the packers, in their  
frantic attempts to prevent our suc-  
cess, have furnished the spice which  
is invaluable to a campaign of this  
kind.

**Beginning of New Life**

"So much has been done, and the  
spirit has been so fine that it is im-  
possible for us to express our appre-  
ciation, and so that the people who  
have worked may not have worked in  
vain we here and now dedicate our  
lives anew to the task that lies before  
us. Yesterday it was the ambition of

our lives to bring this campaign to a successful conclusion, but already the ambition of yesterday is but the stepping stone for the ambition of today—to make the success of yesterday but the beginning of a new and better life for the Associated Raisin Company. No organization has ever been paid a finer tribute than has been paid to us in the last few weeks by the universal support given to our campaign—yesterday the crowning ambition of our lives was to succeed—today it is a higher and better ambition, which is to be worthy of your confidence."

#### EAT MILO

We are beginning to envy the chickens and the stock that eat California grown milo in their daily ration. It is wonderfully fine eating. We know, for we have been eating milo muffins, milo hot cakes, milo mush, and we are going to try some more.

The trying of this new feature of California diet was made possible by the sending to this office of home grown milo from Orland, Glenn County, presumably Glenn grown milo. Macy's Poultry Farm, of which W. H. Macy is proprietor, ground the milo. Regarding the method Mr. Macy writes:

"We have attached a bolter to our feed mill and make good palatable meal out of any of the sorghum grains. I have our county farm adviser a sample and he has taken it with him over the country. Already as many as 20 different parties have brought us a sack or more of grain to be made into meal for them. Many have come for small quantities, and for hot cakes, muffins, hot corn bread and mush, nearly all report it excellent. One man came in 15 miles and got a sack ground. His neighbor, having tried it, was here for a sack yesterday.

You will receive a small package of this meal which is made from the most common of these grains here, the yellow milo maize. Try it in muffins or old fashioned corn bread with one-third white flour."

The milo sent by Mr. Macy was liberal enough so that it has been tried by several of the Cultivator force, and all unite in saying: "It's good."

The milling people have been trying to get us to grow more good yellow and white corn that we may have freshly ground corn meal in our California diet. We hope more of the corn will be grown, but if it is not, let us all consider eating more of our home grown grains. Try milo. Many a farm has the grinder. Do as Mr. Macy has done, put on the bolter, have your meal fresh, and eat something that is exceptionally good. Send us in the recipes for things made of milo.

We may add that we are informed by a large milling concern that milo meal and milo flour will soon be on the market.

#### PRUNING GRAPES

Every grower of grapes in California should avail himself of the ability of Professor Bioletti of the state university. His life work has been with vineyards and for many years with the vineyards of California. He has written many works upon the vine and its handling. His latest is Circular 191 which is being mailed out by the state university. It is "Pruning the Seedless Grape." To California vineyardists it is invaluable.

#### AGAIN IN ACTION

Farm Adviser Essig, recently appointed to Ventura County, writes that the old officers are automatically reinstated and the county farm bureau is again in action and directors' meetings are already being held.

Committees at once placed in action are: On Projects: J. D. Culbertson,

George D. Reid, Wilbur Stiles; Labor: James N. Proctor, L. C. Ramsauer, J. H. Hitch; New Crops: George Willett, J. N. Thille, Thomas McCormick; Meetings: E. W. Gerry, Clarence Hawley, A. Everett; farm bureau monthly editorial committee: Henry H. Neel, L. C. Ramsauer, J. H. Hitch.

#### IMPERIAL AGRICULTURAL ASSEMBLY

The third annual agricultural assembly of Imperial County will be held at Holtville, February 14. This is one of the most important agricultural events of the Imperial Valley.

At last year's assembly the people of Imperial gave a barbecue at which hundreds were fed Imperial produced beef. We understand there will be no barbecue this year but the ladies of Holtville will serve mid-day dinner. The Holtville band will render musical selections and there will be other musical numbers. There will be an agricultural movie showing work of the department of agriculture in aiding farmers.

Other features of the program are:

Morning Session, 10 O'clock

Early Vegetables, by Thomas Elliott, commercial agent Wells Fargo; Drainage Problems in Imperial Valley, with pictures, by Prof. W. W. Weir, of soils department, University of California; Rural Planning, by Prof. Wal-

ter E. Packard, assistant state leader of farm advisers.

Afternoon Session, 1:30

Food Products and Their Conservation; Pima Cotton Cultural Methods; Selection of Profitable Dairy Cows, by Prof. Van Norman; Marketing Problems, by Harris Weinstein, state market director; Milk Producers Association, by J. M. Henderson, Jr., presi-

dent Northern California Milk Producers' Association; to be followed by plans for organization in Imperial Valley.

Women's Section, 10 A. M.

Practical Talk on Food Conservation, by Miss Lillian D. Clark, state leader of home demonstration agents, and Mrs. Della J. Morris, emergency district home demonstration agent.

## Prepare For Frosts!

You can't afford to risk the loss of your crop by frost. The nation needs every pound of fruit and vegetables you can produce. Insure a full crop by installing the

#### "Bolton" Orchard Heater

Most effective means of frost prevention offered to the grower. Cheapest to operate. Quickly started. Distributes heat evenly. Burns long time on single filling of fuel oil. Lasts for years.

San Francisco, Cal.

Stark City Roots—Heavy, Wide-spreading, Full of Vitality

## Plant Stark City Roots For Quality Fruits

Success with fruit growing is well started when you have chosen the best strains of fruits, and have planted strong, sturdy trees, with healthy, vigorous root systems.

None but the best varieties of fruits are propagated at Stark City, and none but the best trees and plants that are grown here are offered for sale—the rest are burned. This assures you the highest grade nursery stock.

#### Read What Growers Say:

Stark City trees are grown in an ideal climate and a rare soil of highland limestone and grit formation. These natural advantages, plus our scientific methods of propagation and training, produce trees with exceptionally heavy, wide-spreading roots, thick, strong bodies and well formed tops. Such trees quickly establish themselves, when transplanted, make unusually rapid growth and reach the fruiting stage earlier than ordinary stock.

"All of your trees and vines are the best I ever planted."—John Rapelye, New York.

"My trees are making rapid growth, proving the result of setting your well-grown, well-rooted stock."—J. M. Carter, Texas.

"I have received nursery stock of various kinds from you and invariably found it well-rooted and EXTRA VIGOROUS GROWTH."—L. R. Johnson, Professor of Horticulture, Missouri.

#### Stark City Trees are Guaranteed

—to be true to name—to live and make satisfactory growth—to reach you in prime condition. This guarantee is the first-hand responsibility of this Nursery. We sell direct—no agents or other middlemen represent us. This also assures you getting the genuine, original Stark City Trees.

## Preparation and Care of Hot Beds

The hot bed should always be placed facing the south where it will receive sun all day, and in a sheltered spot if possible. One should be able to get to it from all sides, for convenience in giving care. Of the two types of hot beds, the raised and banked kind is better for wet locations, since it is not so likely to be flooded with water. Otherwise, dig a pit deep enough to bring seed bed to ground level. The hot bed should be started as early in January as possible, and only fresh and somewhat strawy horse manure is suitable for it. Pile the manure compactly near the bed and supply it with sufficient water to insure strong heating. When the latter is accomplished restack the material, getting the outside well mixed with the interior. When hot the second time, spread in the bed layer upon layer until finally it is from 12 to 15 inches deep, the more strawy portions at the bottom. Be sure to pack the material firmly and evenly as it is put in; the edges and corners especially. When this is done put on an even layer of good garden soil, mixed with leaf mold or well rotted manure, about four inches deep. Then put on the sash, first inserting a soil thermometer, or a dairy thermometer may be used instead. Make this test when the sun is not shining upon sash. In a few days, the temperature will fall to 90 degrees, and the bed may then be planted as usual.

After sowing the seeds, one has to exercise care to prevent the temperature from rising above 70 degrees or falling below 50 degrees. This is accomplished by allowing an opening along the top ends of the sash to carry off any excess heat. This requires careful attention every day, the sash being lowered somewhat every afternoon (if warm), and closed each

night to retain the warmth. Some advise always leaving a small chink at the upper end of one sash to do away with any possible injury to the plants from too close air.

The proper care of a hot bed requires considerable attention and good judgment, but if the venture is successful it pays well. When the small plants of tomatoes, pepper or egg plant seem well established they will do better on warm days if given plenty of air. That will make them more stocky and hardy. When of sufficient size they should be transplanted to develop better root system and a greater vigor, to prepare them for setting out in the open.

Be careful not to over water,—a common fault in caring for a hot bed. That would make the plants exceedingly liable to disease, and so soft as to make them almost worthless. Watering should be done in the morning, as a rule. If necessary to water at night, the water should have the chill taken off. On the coldest nights the heat would be conserved by throwing some sort of cover over the sashes; the glass radiates the heat rapidly after sunset.

Some sow seeds in the hot beds in rows; we advocate broadcasting as more economical of space and better for our purposes.

When the time comes for transplanting the plants from the hot bed to flats, they should be hardened off in the hot bed for a few days, by exposure to the air, and the amount of water given should be lessened to toughen them. After plants are transplanted and hardened off they should again be protected by glass or oiled cloth covering from rain and wind. C. F. Palmer, Supervisor of Agricultural Department, Los Angeles City Schools.

## Cutting Flowers

Written for California Cultivator By Ernest Braunton

IF ONE were to ask me which I preferred, flowers in the house, or flowers in the garden, I could have but one answer. They would remain in the garden, and there is no indecision possible. I am not extremely fond of flowers in a vase; not that they are not beautiful, not that they are altogether out of place, yet I do not like their associations; or rather the lack of proper associations.

But another phase of the matter here enters. There is no doubt but flowers brighten any room except it be overful of grossly gaudy articles and objects, and then, strange to say, they act as a neutralizer and subdue and simplify the contents of the room as a whole, being the only natural and really beautiful object (perhaps) present. Thus they are never quite out of place in the house except too many or too many colors are used. So we will admit that cut flowers are always admissible if number and colors be well balanced and harmonious.

Comes then another consideration. The garden should be so full of flowers that those taken into the house will never be missed. A garden may have too many flowers for the size of it, but it would have to be very crowded indeed before such an impression would strongly appeal to the casual observer. But let us grow such an abundance of flowers that any quantity plucked for the house would not

rob the garden of anything needed therein. This plan or procedure will not necessitate any considerable expense for we will grow plenty of good common sorts that cost but little outlay in money or time in care.

And now, as the old-fashioned parson was want to say, we come to our fourthly (and let us hope the last?) Do not some plants, as well as some gardens, have too many flowers? Before cutting, give the garden a good "look over;" see if there is not a part, or a plant or plants that have too many flowers. If so, and we take some of them we thereby benefit the garden as a whole. Really, the plant that is literally a mass of flowers is more or less of a monstrosity and is seldom as beautiful as one where many flowers nestle down in settings of appropriate green foliage. For too many flowers, like hope deferred, "maketh the heart sick." Wealth of bloom is not always a wealth of beauty. For it is not quantity alone that gives you great joy; there must be quality. As a group of precious stones needs an appropriate setting (though one alone may require none) so do jewels in flowers need surrounding masses of appropriate foliage. Also please remember that some plants require to be systematically and continuously robbed of flowers or the latter will very quickly pass into seeds and the plant will cease to bloom and put forth its whole effort in perfecting

## Make Sure of a Heavy Stand

This season when hay will be worth big money how can you be sure of the alfalfa seed you use?

The answer is easy:

To get a heavy stand that yields extra-tonnage cuttings, plant Morse's Seed.

If your soil and moisture conditions are favorable, you can depend on this seed for a satisfying, big-profit stand.

Morse Alfalfa Seeds are of every standard variety. Each is government approved for purity. Each has passed a severe germination test at our seed testing station.

### Morse's Extra Recleaned

is a big tonnage variety—not a freak—not an experiment. Long-lived, steady-yielding, quality-proved. Produces heavily in all climates and altitudes. "Leaves" abundantly—hence is rich in food value.

Now then—The supply of Morse's Extra Recleaned Alfalfa and other varieties is not overly large this year. Prices will advance. Get your order in now. Write for prices today.

C. C. MORSE & CO.

729 Front St., San Francisco

# MORSE'S Alfalfa

its seeds. For in the latter lies its only chance of reproduction, toward which the supreme effort is aimed.

### Tinning Tree Trunks

Where small hollows occur in tree trunks and the strength is not thereby impaired it is not necessary to fill same. All rotting and dead tissue should be removed and the interior thoroughly sprayed or painted with something that will kill any insects therein, arrest decay, and if possible cover with a solid coat every inch of exposed surface. A metal plate, preferably of zinc, may then be fitted into the opening against a ledge or lip cut around the edge of opening, and a quarter-inch wide. This should be cut out of the solid wood and must be deep enough so that the edges of the metal sheet will be inside the cambium layer or inner bark or the edges of the zinc will be rolled back as the cambium grows. When the plate is well fitted into place nail thickly all around with galvanized or coppered nails. Then paint the metal with a good paint that will last. If job is well done the cambium will cover the nail-heads in one year and the opening is sealed forever. For long openings, use several sheets, lapping like shingles.

### Most Beautiful Eucalypt

Eucalypts are not, as a rule, chosen for their ornamental value, and even those that are may not be considered beautiful by the possessor, that is attractive to a point in advance of the average tree. But do we have species of eucalypts that have strong claims to beauty? Well, we grow at least one species locally that is in strong demand with florists, who use the sprays because of their ornamental value. Whether or not that is sufficient, proof I will not say, for to me the tree is strikingly attractive, almost curious in its departure from the type of ordinary eucalypts. How hardy it is I do not know but I have never seen a plant harmed by frost in a range from San Diego to Santa Barbara. Its leaves are round as a coin; its color is not any shade of green for the leaf surface is covered with a bloom or powder that is almost milk-white. Its name is Eucalyptus pulverulenta and it should be called the powdered eucalypt.

### The Evergreen Wistaria

This vine is in every respect an evergreen wistaria although the botanist calls it Millettia megasperma because of slight structural differences, mainly in the seed pod. The flowers come in large heads or panicles of spikes a few inches long. The writer has heard of its being for sale at but three places in California; Niles, Modesto, and Morgan Hill. The color of the flowers is a rosy purple and these last longer than do the common wistaria flowers. The plants are not so robust in constitution as the common sorts and I have heard much complaint on this point, not alone from the layman but from professional nurserymen who have been unable to make grow more than one-half the plants purchased from the introducers. This description therefore carries with it no recommendation of purchase, but the plant is believed to be one of sterling worth after of blooming size as it is then past the danger size. In any event it is a rare and interesting plant.

System is an excellent servant but a terrible master, and we want to be able to lay aside or change the plan, however efficient as a general working principle, when something more important than plans or systems is to be considered.

"The beater on the axle construction saves dollars for me in time, labor and cost of upkeep."—An excerpt from a user's letter.

# JOHN DEERE SPREADER

Mounting the beater on the axle is the keynote of this better spreader. With this exclusive construction there follows distinctive savings that can be gained in no other way—advantages that mean more years of service, lower cost of maintenance, greater ease of handling and better quality of work.

## Exceptional Spreader Value in These Features

**EASY TO LOAD** from the front to the rear—only 38 inches to the top of the box. You see where every forkful goes. A boy can load it.

**THE DRIVE WHEELS ARE HIGH.** The draft is not sacrificed. High drive wheels save horse flesh.

**THE BEATER DRIVE** is durable and strong. It has the same principles and is as simple as the triple-gear horse power. Gears are enclosed in a dust-proof case. They run in an oil bath. No dust or dirt can reach them.

**THE JOHN DEERE** is the simplest spreader built. Only

half the castings on it necessary on other spreaders. No clutches or chains. Main working parts mounted on the rear axle. They can't get out of line, cause binding, heavy draft and breakage. **A BOY CAN OPERATE IT.** Tell him where to set the feed lever and he only needs to put the machine in and out of gear. That's all there is to it.

**REVOLVING RAKE INSURES** even spreading. No bunching or choking. Every foot of ground is covered—heavy or light to meet field conditions. Wide spread attachment and straw spreading attachment can be furnished.

## Books That Mean Saving and Profit on Your Farm—FREE

### \$15.00 a Day for Four Days

Tells the actual experience of a man and his two sons who made \$60.00 extra money in four days on the White Rock Farm in Pocahontas County, Iowa. Interesting reading based on facts. Get this little booklet. Profit by this man's experience.

### John Deere Spreader Booklet

Tells all about manure, how and when to spread it. Shows how spreading methods affect the value of manure. It's a real treatise on manure. Worth money to you. It also illustrates and describes the John Deere Spreader.

Shows how simple and easy to operate it and why this machine will give better and longer service than other spreaders.

### Better Farm Implements and How To Use Them

A 156 page text book for your library. Worth dollars. Contains a number of splendid authoritative articles on better farming methods. Tells how to adjust and operate many kinds of implements. Illustrates and describes plows of all kinds, disc harrows, corn planters, cultivators, listers, cotton tools, alfalfa and beet tools, mowers, rakes, stackers, loaders, grain and corn binders, corn cutters, grain elevators, shellers, manure spreaders, drills and seeders, lime sowers, hay presses, wagons, trucks and buggies.

To get these books, indicate the implements in which you are interested and ask for Package MS-24.

**JOHN DEERE**  
Moline, Illinois

Correspondence with the advertisers in the California Cultivator will convince you that their articles will save you money.

## THE SELF-OILING WINDMILL

has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and dirt. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year.

Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws. Write **AERMOTOR CO., 2500 Twelfth St., Chicago** **SMITH-BOOTH-USHER CO.** Southern California Distributors for **AUTO-OILED AERMOTOR** Los Angeles

## IRON AGE

### GARDEN TOOLS

Answer the farmer's big questions: How can I have a good garden with least expense? How can the wife have plenty of fresh vegetables for the home table with least labor?

### IRON AGE

**Combined Hill and Drill Seeder** solves the garden labor problem. Takes the place of many tools—stored in small space. Sows, covers, cultivates, weeds, ridges, etc., better than old-time tools. A woman, boy or girl can push it and do a day's handwork in 60 minutes. 30 combinations, \$4.50 to \$30.00. Write for booklet.

Bateman Mfg Co., Box 400 Grenloch, N.J.

Dixon & Griswold, Agents for Iron Age Tools 148-49 North Los Angeles St., Los Angeles, Cal.

## GOOD SEEDS

### GOOD AS CAN BE GROWN

Prices Below All Others

I will give a lot of new sorts free with every order I fill. Buy and test. Return if not O.K.—money refunded.

### Big Catalog FREE

Over 700 illustrations of vegetables and flowers. Send yours and your neighbors' addresses. **R. H. SHUMWAY, Rockford, Ill.**

## Owens Transplanter

Only Self-Setting machine. Transplants corn, potatoes, tomatoes, melons, strawberries, etc. Any depth. Better than hand. As plant is set, it closes rollers, presses soil around plant. Hoe's surface and leaves no wet surface on the back. **J. L. Owens Co.** 1129 Barnum St., Minneapolis, Minn.

## Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Gypsum

Where can I secure gypsum, and what is its cost? How much per acre will be required to kill alkali?—Subscriber, Stratford.

We think any dealer in fertilizers advertising in the Cultivator can supply you. The amount per acre to "kill alkali" depends. If the alkali is what is ordinarily termed white alkali,

no advantage is to be had from the application of gypsum. If however it is the carbonate of soda or black alkali, then gypsum applied changes the black to white and permits its leaching out of the soil through heavy rains or irrigation, and in this way corrects to a degree the alkaline conditions. As to whether this should be one or three tons, or even more, as is sometimes the case, per acre, depends upon the soil and degree of alkalinity.

### Cooperative Bean Selling

A San Joaquin Valley subscriber

asked information as to best opportunity to market his beans. We wrote to the California Lima Bean Growers' Association as to whether it had opened its membership roll to other than Lima growers, and Manager R. L. Churchill answers recommending that any bean grower in the San Joaquin Valley write to the Central California Bean Growers' Association at Stockton, through which organization he can probably handle his beans. He further adds:

"In reply to your inquiry as to whether our association is open to membership to other than Lima bean growers, will say that some three months ago we amended our articles of incorporation and by-laws so as to permit us to market other than Lima beans, and under this provision we are accepting into membership two local associations of growers in the San Fernando Valley, one at Garden

Grove and one in San Diego County, each of which will contain some members who will grow other varieties than Limas, to be marketed through our association. This will enable us to care for the requirements of some of our Eastern customers in other varieties of beans, particularly in the shipment of mixed cars. We shall probably confine our activities to Southern California, particularly in view of the recent organization in Central California. We have had a gratifying increase in membership during the past two months, amounting to about 60 per cent as compared with our 1917 membership, and we are anticipating further substantial gains before our 1918 pool closes in the spring."

### Corn Smut

Please tell me if there is a treatment to prevent smut in corn?—Subscriber, San Jose.

Smut of oats and corn is not benefited by any treatment of the seed. Neither is the disease so serious as is the wheat or oat smut. The only treatment is preventive, i. e., by destroying all the smut spores, which should have been done when first beginning to show on the grain or ears. This may be done to a lesser degree by burning the field of stalks which may afford lodgment for spores which were scattered some weeks or months ago.

### Persimmons

How many are the varieties of Japanese persimmons? What are most successful? Are there any commercially successful orchards in this state? What soils are best adapted to growing persimmons? Can they not be raised with less water than most fruits?—Subscriber, Exeter.

There are scores of varieties. As to the most successful there is such diversity of opinion that we hesitate to select them. There are commercially successful orchards in the state. Presumably the demand will be rather limited, although with the curing of the paste, which we understand is a great commercial proposition in Japan, it is possible there may be great development in the industry here. There must be sufficient moisture at the roots, and with the fruit remaining on the trees until late in the fall this condition must be maintained the entire season. The tree is hardy and will withstand serious drouth. For more explicit information would refer to an article in the California Cultivator of June 11, 1914, by J. W. Mills and a more general one in the Cultivator of January 28, 1915, by I. J. Condit of the state university. In that article are illustrations of the Savuroza and the Yeddo Ichi varieties. Other information as to persimmons may be had in United States Journal of Agriculture, Vol. 1, No. 8, March, 1914. This has to do with the processing of fruit. A new and most desirable variety was illustrated in the Cultivator, issue of December 22, 1917, page 630. Another variety we have tasted and know to be good is called the Whepley.

### Transplanting Sycamore

When may one transplant a sycamore tree and how large may they be safely reset?—Subscriber, Paso Robles.

We have taken even seedlings at end of first growing season from almost pure sand in the wash, this was planus occidentalis, and had them grow favorably. We have also taken husky stick, used for an alpenstock during part of a day's tramp, stuck it in the ground, and in three years had a tree nearly as large as the thigh. The sycamore grows readily from cuttings. We have also replanted the oriental plane in midsummer when in full growth. Ordinarily however, sycamores should be reset when dormant. In other words, at once, as to this season.

### Sweet Potatoes for Feed

Are sweet potatoes and tops good milk producing food for cow? Is it dangerous to feed either of these in very large amounts to horses?—Subscriber, Pomona.

In Henry's Feeds and Feeding Dodson of Louisiana is quoted as saying that he considers sweet potatoes the best root crop for hogs for fall and winter grazing. Connor of Florida

# Plant an Orchard

## CHERRIES

We have this year a fine stock of all the leading varieties of cherry trees—they are vigorous and well rooted.

## PEACHES

Growers throughout the state received handsome returns from their peaches this year.

## NECTARINES

This delicious fruit is becoming more and more popular.

## APPLES

Our list includes all the desirable varieties for home and commercial planting.

**Write Today for Free Catalogue Planters Guide and Price List**

For several years we have issued a little booklet entitled "Roeding's Practical Planter's Guide." Through this medium much valuable information has been imparted to our customers. We feel we owe a duty to those who are good enough to favor us with their valued orders, and following out this line of suggestion, we have decided to embody the information in the Guide in our regular annual Catalogue. Statements and recommendations made are the result of almost thirty-two years' experience in the Nursery business and in orchard and vineyard management. We are thoroughly equipped, not only to give advice to our customers which will be of value to them, but to direct their efforts along lines which will lead them, if they adopt modern methods of culture, to that success which they wish to achieve.

## WALNUTS

Walnuts are considered by many experienced planters as the most satisfactory crop to raise.

## PECANS

The improved papershell types of Pecans should be planted for commercial purposes.

## ALMONDS

Twenty-five years ago California produced 150 tons. The average Almond output now is 3000 tons.

## Heavy Double Tractor Discs

**KILLEFER QUALITY**

**KILLEFER EFFICIENCY**

Our Engine Discs are built in sizes from five to twelve feet in width. The Discs are made extra heavy for this class of work and are stronger than anything obtainable on the market. The arbor bolts are large and all castings are made heavier in proportion to stand the extreme strain required of the Tractor Tools. The discs are equipped with weight boxes to give the necessary weight to insure the proper penetration on different characters of soil. The pitch of the disc is controlled by connecting arms bolted solidly in place, but which can be changed to any pitch desired within a radius of fifteen degrees.

**The Killefer Manufacturing Company**

2209-21 Santa Fe Ave.

Los Angeles, Cal.

says: "Sweet potatoes may successfully be substituted for half the corn in the ration of working horses; three pounds of sweet potatoes replacing one pound of corn." Another feeder found 100 pounds sweet potatoes as useful as 150 pounds of corn silage for dairy cows. While more valuable, sweet potatoes are also far more expensive to produce than corn silage. The vines, though difficult to gather because they trail and take root at short intervals, are often used in the green state for feed.

Vetch on Alfalfa

If vetch is planted with alfalfa will it fertilize or induce heavier growth, especially if it is disked in? How much should be sown per acre with barley, and where can seed be had?—Subscriber, Hickman.

We would prefer very much to have alfalfa seed used in connection with barley which might be grown for spring crop, but in fall the vetch could be sown and give good winter growth providing plenty of winter moisture is secured. Seed may be had of any seed house advertising in the Cultivator.

Ants in Apiary

Have a few stands of bees which are doing well, only ants are bothering them. Have hives on a stand and the legs in pails of water but the ants still get to the hive. Will bees eat ant paste?—Subscriber, Upland.

There is a difference of opinion as to the injury done by ants. However, they may be controlled by use of carbon bisulphide. Pour down the holes which should be plugged up with moist earth as soon as the application is made. Even gasoline or distillate or strong solution of cyanide are sometimes used with excellent results. The poison formula given in a recent issue of the Cultivator might prove as deadly to the bees as to the ants. Some prefer to make the application by using a steel bar and making a hole, say, a foot deep, and pouring the distillate or bisulphide in this hole and plugging.

Rats

Would like to know of successful ways of getting rid of rats, water rats, I think they are. — Subscriber, Dos Palos.

A good steel trap will accomplish the work most safely. There are rat poisons, however, but a trap made along the same line as the small ordinary five cent mouse trap, though much larger, is good. Also, with rat infestation it is always wise to clear out any old buildings or any place where rats can locate and breed, in other words, give the fox terrier and the big cat free chance at them, and it will aid materially in reducing the pest.

Shrinkage of Hay

An Inyo County subscriber inquires as to shrinkage in baled alfalfa. A serious loss was observed, in fact on a 400 ton shipment a shrinkage or difference of 15 tons between hay baler's weights and receiver's weights over railway scales was noted. That particular hay was reshipped however, and, of course, lost with the extra handling. The subscriber did not tell us how long an interval there was between baler's weighting and the final. We have asked the California Alfalfa Growers' Association as to observations in the matter of shrinkage and have reply from Manager Farrar: "Our experience in shrinkage of hay here has been that after baling it out of shocks in the field and storing it for six months there is a shrinkage of 200 or 300 pounds per ton." This is a much heavier loss than that suffered by the inquirer. It must be borne in mind however that length of time and other circumstances must be considered in making estimate of such loss.

Chestnuts

Would chestnuts do well in this locality? Would nurserymen handle chestnut trees or would it be all right to plant the nuts and grow seedlings? Does the tree shed its leaves?—Subscriber, Tulare.

The small sweet Eastern chestnut does not bear well in this state excepting in favored coast sections, but the large Italian or Spanish type has done well, though not bearing exceptionally

large crops. They make very ornamental, large growing tree. Some plant them as seedlings, but the grafted varieties are safer. They may be had for from 40 cents to a dollar each. The Japanese Mammoth, a small growing tree, bears earlier and produces very large nuts. Any nurseryman advertising in the Cultivator can supply you. The trees are deciduous.

Well for Cesspool

Adding to our former suggestion regarding the use of an abandoned well for a cesspool, the matter was submitted to the state board of health with the explanation that there were two wells, one to be used for a cesspool if it could be done without danger to the other. L. B. Mallory, assistant secretary, writes that owing to the liability of contamination it would be very unwise to make such disposal of the sewage.

Pruning Prunes

I have prune trees five years old which have never been pruned back. What is best method of handling these trees?—Subscriber Chino.

To condense five years pruning into one is impossible. It is most unfortunate that trees are allowed to go from planting time without the help which may be given by the pruner, for such trees have a habit of becoming top heavy, and the first full crop bends and breaks the tree, sometimes entirely ruining it. In the first three years of a prune tree's life it should be cut severely, simply building a foundation to carry the load of branch and fruit of later years. But this is no time for a preachment as to the five years of non-pruning. It is impossible to give very good advice in such a case without seeing the trees, for presumably many of the trees, if given a severe pruning which will give a fairly good tree for the future, would have taken off practically all this year's crop, which is a thing few orchardists care to do, so about all the long distance advice we can give is to cut back, so far as possible, some of the big strong growing leaders which will throw out strong summer growth and give opportunity another year of shaping tree so as to carry its future loads. Save this year's fruit as much as possible, bearing in mind that this will come on small fruit spurs along fruit bearing laterals.

Drying off Cow

Have a Jersey cow that gives about five quarts of milk a day six weeks before she becomes fresh, and I have some difficulty in getting her dry. Would you feed her well and milk her on through or would you dry her if possible four weeks before coming fresh? If you dry her how would you proceed?—Subscriber, Glendora.

There is difference of opinion as to "drying off" a cow. Many think that six weeks or two months rest should be given. Others boast of the continued production of the cow which milks up to calving time, then takes up her new duties apparently without injury. It depends largely upon the cow. When one wishes to dry cow off it is best, say, six weeks before calving, to not milk out clean for a few milkings, and then, if possible, drop to one milking a day. But some very persistent cows will not permit this.

Loans Refused

A subscriber writes regarding inability to secure loan from the federal loan bank at Berkeley, enclosing with his statement letter from the secretary of the land bank in which he says that: "I have looked over the appraiser's report and find that he did not make a recommendation." Our subscriber writes us: "We have been told that this federal land bank would give to farmers cheap money and help them in producing more. We now find that the farmers who need help the most cannot secure a cent from this bank. I have a good well and irrigate from it and know that the appraiser sent here did not wish to help the farmers. He appeared to look at it from the standpoint of the money loaner."

The Cultivator appreciates the feeling of the subscriber, but it also understands the situation in which the management of the bank is placed.

War has come and complicated the financial situation, and funds which would have been used to loan to American farmers have been turned into other channels. Besides that, were the conditions normal, it must be

borne in mind that banking is strictly a business proposition. The federal land bank is not a branch of the government for paternalism, but under the act of congress it must be managed. Continued on Page 183

Efficient Pumping Engines

INSURE AN ABUNDANCE OF WATER

INSTALL an engine for irrigation that will require practically no attention during the pumping season. The ALPHA ENGINE is insurance against troublesome delays and breakdowns. Exercise your best judgment by installing an engine that will in no way hamper your pumping operations.

Decide Now to Install

THE ALPHA ENGINE

Sizes 1 1/2 to 28 H. P.

Hopper Cooled, or Closed Jacket. Portable or Stationary. Fitted with High Class Rotary Magneto. No Batteries or Coils Required. Engine starts on Magneto without cranking.

Alpha Engines and Viking Rotary Pumps Make Efficient, Reliable Pumping Plants

THE high efficiency of the Viking Rotary Pump is due to its positive delivery and correct design, and means that it will deliver more water for the same amount of power than any other type. Capacity 20 to 1600 gallons per minute. Easy to Install.

What is Your Pumping Question? We can help you. CATALOGS ON REQUEST.

DE LAVAL DAIRY SUPPLY CO. 61 BEALE STREET, SAN FRANCISCO

Right Back in the Same Row and Right Up to the Trees Under the Low Branches!

Patented "Turning Feature"

Immensely Important in Orchard Tractor

Will the tractor you buy turn in a 10-foot circle (5-foot radius) pulling as strong on the short turns as on the straight away—and will it do that without straining one side or one wheel? That's of vital importance! Many tractors work well when pulling straight—it's on the turns that you will get good or poor service from your tractor.

The Bean TrackPULL Tractor is the only small orchard-and-vineyard tractor made that delivers full power on 10-foot turns and it turns without straining one side, pivoting, or doing anything else that a tractor shouldn't do.

This remarkable machine is built on patented FRONT-DRIVE principle—you steer with the single track which does all the pulling whichever way you go. You can turn it back down the same row (see illustration above) without lifting out the tools making as short a turn as with a team!

Absolutely no other tractor acts so like a team while doing three times as much, is so handy, so efficient, so staunch, and so protected against over-strain!

You'll want the TrackPULL eventually—go see it now. Send coupon at once for catalog, complete description, and name of nearest demonstrating agent.

Don't buy a tractor that does less. Don't do without one that does so much. Send the coupon now.

## More About Foods

Graphic Statement Made by Member of Food Commission. Will Appeal to Every Loyal Citizen to Do His Utmost to Conserve and Produce

HIS statement was given out January 25 by the United States food administration: The food situation in Europe has become steadily more difficult and larger demands have now been made upon us than ever before. On January first we had already exported the 10,000,000 bushels of wheat which comprised our normal surplus from the last harvest. The latest cable from Lord Rhondda, who speaks on behalf of the wheat control of the French, English and Italian governments, needs no added word from me:

"Unless you are able to send the Allies at least 75,000,000 bushels of wheat over and above what you have exported up to January first, and in addition to the total exportable surplus from Canada, I cannot take the responsibility of assuring our people that there will be food enough to win the war. Imperative necessity compels me to cable you in this blunt way. No one knows better than I that the American people, regardless of national and individual sacrifice, have so far refused nothing that is needed for the war, but it now lies with America to decide whether or not the Allies in Europe shall have enough bread to hold out until the United States is able to throw its force into the field. I have not minced words because I am convinced that the American people, if they know the truth, will not hesitate to meet the emergency."

We have replied: "We will export every grain that the American people save from their normal consumption. We believe our people will not fail to meet the emergency."

In addition to this amount for the Allies, we must find 15,000,000 bushels for the Belgian relief, or these people whom we have supported all these three years will starve; and we must also furnish some 10,000,000 bushels for Cuba and other neutrals, upon whom we are dependent for other foods in return. We estimate the American people have saved as much as 30,000,000 bushels out of last harvest, and if we are to meet the increased demands we must rigidly reduce our wheat consumption to 30 per cent below normal until next harvest.

In addition to wheat, we are shipping large quantities of corn and other cereals with which to mix in their bread, but Europe must have a wheat foundation for the loaf just as ourselves.

In beef our pre-war exports to the Allies averaged less than 1,000,000 pounds per month. During the last two years we have averaged about 22,000,000 pounds per month. They are sending their boats to load an average of 70,000,000 pounds per month during the next three months. Our own Army apparently uses about 10,000,000 pounds per month more than normal to these same men. Our cattle have not increased. We can only provide these drafts upon us by reducing our consumption. As we eat more meat than we need to preserve health, this will do no harm. Our production averages roughly 650,000,000 pounds per month, and these demands represent a little over ten per cent of our consumption. Our own domestic beef consumption has increased from about 70 pounds per person per annum to about 80 pounds during the past five years. The public health has been

no better during this last period. If we could get back to our pre-war meat consumption we should solve our present problem. The meatless day has made it possible for us to maintain these exports for the present.

In pork products we exported to the Allies about 50,000,000 pounds monthly before the war. We have shipped them about 100,000,000 pounds per month during the past two years. During the next three months they are asking for over 150,000,000 pounds monthly. Our hogs have decreased since the war began. Our own consumption is far above our health necessities and we can easily save this amount. Our average monthly production of hog products is roughly 750,000,000 pounds. We need to export an increase over pre-war averages of 100,000,000 pounds, and, as our supplies are below normal, we need to save at least 20 per cent until such a time as our hog supply increases.

If the Cuban sugar crop yields as estimated, we will need to save from 200,000 to 400,000 tons of sugar from our normal consumption if the Allies are to be supplied—about ten per cent.

Not only the increased demand, but also the sharp and distressing reduction in rations amongst the Allies are evidence enough of the acute situation we must meet.

The president will tomorrow issue a program for food conservation. The program in many particulars is of necessity largely voluntary but in some particulars it can be enforced under the food bill. In any event no measure that has not the loyal support of the majority of our people can ever succeed. The results of voluntary conservation during the last six months abundantly prove the desire of the vast majority to make the sacrifice necessary to feed the Allies and our own soldiers. There is, however, a national risk that we fail to secure the necessary conservation through opposition of a minority disheartening the majority. We should like to have the authority to make the minority bear its share of the burden. The situation does not bear delay and we propose to do the best we can on a voluntary basis, plus what authority we do possess.

It would be easier for us to ask less than necessity demands. What we do ask are not large percentages, there is no privation in them. In any event we have no intention of exporting more than our savings, for we must and will protect the food supply of our own people. Therefore the fullness with which we can meet these demands is determined simply by our monthly saving. We have abundant other foods which we can substitute for the exports wanted and if we could only eliminate all waste and all unnecessary consumption it would solve the problem. A large number of our people are not in a position to reduce consumption. Their daily life is of necessity one of continuous economy and saving. The responsibility and the burden of these savings must, therefore, fall in a large degree upon those more fortunately situated. Those who have most must save most.

Under new food regulations, the Swiss people are allowed only a pound of sugar per month per person. The butter ration is one-fifth of a pound per month.

### COMPENSATION FOR USE OF TOOLS

The neighborly farmer is one of our country's greatest assets. Many a young farmer starting in has had great help in his shortage of capital because of ability to secure occasional use of tools or implements from a neighbor, and fortunately he is usually in a position to make return and show fullest appreciation for these favors.

Again there are those who are professional borrowers. They are the bane of civilization. A careful man, the "good neighbor," returns the tools borrowed as good as when secured or the wear replaced as far as is possible, and, further, he returns them promptly. The other man, however, has created a situation which calls for correction, and one of the farm centers of the Napa County bureau has suggested the placing of loaning on a strictly business basis. Adviser Baade took up the matter with the University Farm and Professor Davidson suggests:

"The only carefully worked out data of this kind that we have is published in the United States Department of Agriculture Bulletin No. 338. This bears the date of January 18, 1916:

"Grain drill—Average cost, \$72.00; cost per day, \$1.71.

"Mower—Average cost, \$41.00; cost per day, \$1.90.

"Land roller—Average cost, \$24.00; cost per day, 57c.

"Sulky plows—Average cost, \$42.50; cost per day, 59c.

"Data is not given for other machines.

"We are inclined to think that for California conditions this cost would be increased at least 50 per cent.

"The cost of operating depends upon the size of the machine, and the daily cost varies very much with the amount of work performed each year, but these suggestions should be of some interest, at least, in this connection."

Before such a plan can be worked out in all its details, there will be still opportunity for expression of the old neighborly way of being neighborly, but the Cultivator appeals for consideration of justice in the matter and especially for the return of the tool or implement as soon as its mission is performed. This borrowing and making the owner call for his own does not lead to neighborly feeling.

### GOVERNMENT WILL SELL WHEAT

Farmers with last year's wheat still on hand, and for which there is no immediate market, may secure aid in disposing of it by getting in touch with the Food Administration Grain Corporation, the zone agent of which in this state is R. A. Lewin, San Francisco. The department says:

"In cases of disagreement between farmers and local buyers or between country dealers and millers as to grade, the zone agent of the food administration is empowered to settle differences and will render this service when a two pound sample is sent him for examination."

### SAN QUENTIN GRAIN BAGS

Warden Johnston makes the following announcement as to San Quentin made grain bags:

The price fixed is 20 cents a bag, to remain in effect until April 1. In order to distribute fairly the quantity of bags that it will be possible for us to manufacture, the prison directors have decided not to accept an order from any one farmer or consumer for more than 10,000 bags. Bags are standard size, 22x36 inches; they are

packed in bales of 500 each. Those ordering are cautioned that bags may be purchased for their own use only and not to be sold to others.

Any grower who desires to order bags from San Quentin prison may secure copies of the law and rules governing and forms for ordering by applying to J. A. Johnston, Warden, San Quentin. All orders must be accompanied by deposit of ten per cent of amount of order, with the understanding that deposit will be forfeited if the bags are not taken. Farmers are asked to state at time of ordering the latest date at which they can accept delivery of bags.

Don't wait, do it now! Buy war savings stamps!

### DEPARTMENT BULLETINS

"Ever Bearing Strawberries," by Darrow, Farmers Bulletin, 901.

Bulletin issued by the Department of Agriculture, Washington, D. C., "Killing Hogs and Curing Pork," by Ashbrook and Anthony, Farmers Bulletin 913.

U. S. D. A. Bulletin 538, "Increased Cattle Production on Southwestern Mountains." This is by Jardine and Hurtt.

U. S. D. A. Bulletin 596, is a professional paper having to do with feeding dried potatoes to swine.

A state bulletin of particular interest at this time, when there is so much discussion on the application of nitrogen, is by New Jersey agricul-

tural experiment station, New Brunswick, New Jersey. This is "Use of Fertilizer," Bulletin 172, and gives the results of experiments with nitrate of soda.

### GLENN COUNTY FARM BUREAU SCHEDULE

Bayliss, February 1, night meeting. February 1; Ord, 4-5, night meeting 5; Larkin, 7-8, night meeting, 8; Cordora 11-12, night meeting, 12; Jacinto, 14-15, night meeting, 15; Orland, 18-19, night meeting, 19; Plaza, 21-22, night meeting, 22; Elk Creek, 28, 2 p. m.

The regular meeting of the Board of Directors will be held on Saturday, February 23, at 10 o'clock in the High School building at Willows.

## "You Can't Beat It"

"That orchard of mine is the best in the country. This year it's bearing a crop of fruit that would break the branches if they weren't propped up. And it's only five years old at that."

"How did I do it? That's easy. Learned to use my head and

## HERCULES DYNAMITE

"I've not always had that kind of an orchard. I'll admit it. Mine used to be only average or below average, instead of way above average as that one is. It's because I used to plant my trees in spade-dug holes—holes with hard root-resisting sides. Now I blast the holes with Hercules Dynamite. As a result the holes have soft walls, ready to welcome the roots. Also the ground around each hole is shaken up, gets sort of an internal ploughing."

"Sounds too simple to make such a difference in the orchard doesn't it? And yet, when you think of it, there is a very good reason why the difference is there."

"The roots of a tree are the only part that doesn't show but they are the most important part at that. The entire life of the tree depends on them. If you prepare the ground so that they can grow twice as fast, become twice as strong, as under ordinary conditions, you're going to get a tree that's twice as good, aren't you? Why of course you are! And that's what Hercules Dynamite does."

"There's a book about the use of dynamite for orchards that you ought to read. It's called 'Progressive Cultivation' and it's sent free on request. Write for it today."

## OUR ADVERTISERS RELIABLE

We guarantee our subscribers against  
 loss through dishonesty of any adver-  
 tisers in the Cultivator. We do not at-  
 tempt, however, to adjust trifling differ-  
 ences between subscribers and honest,  
 responsible advertisers, nor will we pay  
 the debts of honest bankrupts. Notice  
 of complaint must be sent us within 30  
 days from date of the transaction, and  
 the subscribers must have mentioned the  
 Cultivator when writing the advertiser.

## THIS WEEK'S COVER

The winter irrigator will get a  
 hunch this year from the weather.  
 Many have for years proceeded upon  
 the plan of giving heavy winter irri-  
 gation, no matter how heavy the rains,  
 to fill the ground with moisture to  
 carry through the long dry season.  
 Others have imagined that perhaps  
 this heavy irrigation in a rainy season  
 might so fill the soil that it would  
 leach away fertility, especially ni-  
 trates. But that argument is certain-  
 ly without justification this year.

A hint is given in the cover illu-  
 stration this week. The grape grower is  
 there filling his soil and securing prac-  
 tical assurance for the summer's crop.  
 Should there be no heavy rains with-  
 in the next six or eight weeks disaster  
 will come to many a vineyard and or-  
 chard which is not given winter irri-  
 gation.

## BEET COMMISSION

Hoover's sugar beet commission  
 is in action. Three members were ap-  
 pointed; Prescott F. Cogswell of Los  
 Angeles County, Merle Rogers of Ven-  
 tura County, John Perry of San Joa-  
 quin County. Mr. Perry was unable  
 to be present at the hearing in Los  
 Angeles for the first two days. The  
 other two commissioners are receiv-  
 ing the evidence. The start has been  
 made with evidence as to cost of grow-  
 ing beets; later cost of manufacturing  
 will doubtless be taken up. The beet  
 growers are represented by Attorney  
 Bishop of Orange County; the factor-  
 ies by Attorney John D. Fredericks.

## ORDER EARLY

The forehanded farmer, in these  
 days of transportation gluts, if an im-  
 plement or machine is needed months  
 hence, should give earnest considera-  
 tion at once to the matter, even order-

ing with request for immediate ship-  
 ment. The transportation situation is  
 being cleared as rapidly as possible,  
 but it appears the coming year will be  
 one of the most strenuous in the his-  
 tory of the country, and rolling stock  
 will be demanded for military uses,  
 which will make all transportation  
 slow.

If we need fertilizers, implements,  
 machinery, seeds, especially seeds,  
 we should anticipate the need by  
 weeks or months.

## ESSENTIALS

Time was when the food admin-  
 istration, or an official connected with  
 the food administration, ruled that the  
 greater percentage of California's pro-  
 ducts were non-essentials and called  
 for little consideration on the part of  
 the federal government in the matter  
 of transportation or labor. This seems  
 to have been premature, at any rate  
 orange producers and producers of all  
 kinds of fruits are now given assur-  
 ance that plans will be perfected  
 whereby adequate transportation for  
 all farm products will be secured. As-  
 surance as to the labor question is not  
 yet so complete, in fact, it is even  
 probable it is beyond solution which  
 will be entirely satisfactory to all pro-

duced to the minimum. There was an  
 abundance of food; it was well cook-  
 ed; all ate heartily; the conservation  
 practiced did not display the best  
 judgment.

A year ago one of the scarcest arti-  
 cles of food in America was the po-  
 tato; at the time of this luncheon,  
 however, a hundred million bushels  
 in excess of former production is  
 somewhat embarrassing. But pota-  
 toes are the best of good eating and  
 in high favor in this country and  
 bulky shippers, therefore we have the  
 privilege and it is our duty to eat po-  
 atoes, saving the cereals, especially  
 rice, which are in demand for export  
 to European countries. At this lunch-  
 een, while we were given war bread,  
 made with the minimum of wheat, no  
 potatoes were served, but rice was  
 used to replace them.

Those having in charge the manage-  
 ment of this affair are patriotic in the  
 extreme, but it seems to us they were  
 shortsighted.

## PLANT POTATOES

Potatoes are holding fairly firm  
 in the markets notwithstanding a  
 bumper crop was raised last year. The  
 total production of 1917 in this coun-  
 try was 442,536,000 bushels, or nearly

## THE MILITARIST'S TRINITY

Here is a Prussian creed which is supposed to drive the German peo-  
 ple to the utmost obedience to the ruling class. It was written by  
 Schlunsen in Morgenpost.

"There is only one God—fear. There is another God—annihilation.  
 Expediency is the intercessor and completes the Trinity. Germany's  
 one hope lies in that Trinity. All hope in invisible intercession must be  
 put away. Fear of the doom that awaits them must be inspired in the  
 breast of all who oppose Germany. In that lies her salvation. She must  
 trust in no other. The struggle for unity would be its own compensation.  
 When that is accomplished, Germany can dispense her favors and can  
 defy her enemies—and the invisible God."

ducers. But fruit has taken its true  
 place as a necessary feature of the  
 world's diet.

## BAD BREAK

Live stock men have a most ser-  
 ious problem in trying to meet  
 weather conditions. Their stock is  
 dying of starvation, and even where  
 they have funds, it is almost impossi-  
 ble to carry feed to the stock or carry  
 the stock to the feed. So the stock-  
 men appealed to Washington for re-  
 lief from the meatless, or at least the  
 beefless, feature of meatless day, and  
 this relief was finally granted.

This situation was unfortunately  
 taken advantage of by other parties  
 in an ill advised statement placed in  
 Eastern papers, inviting Easterners  
 who liked beef to come to California  
 where beef was served seven days in  
 the week. In these times of war it  
 caused no little comment, for it seems  
 an appeal to what many consider the  
 slacker spirit.

Coast live stock men are up in arms,  
 and while it is admitted that it was  
 merely a case of poor judgment in  
 wording the advertisement, it is most  
 unfortunate, and so far as possible  
 the state should endeavor to correct a  
 wrong impression given to Eastern  
 people of the true California spirit—  
 one of fullest support to our country.

## EAT POTATOES

We recently were one of a  
 bunch of a few hundred men at a  
 noonday luncheon at which things pa-  
 triotic, such as war savings stamps,  
 income tax, food conservation, etc.  
 were discussed, yet one of the fea-  
 tures of the meeting was the eating,  
 and there food conservation was re-

100,000,000 bushels in excess of any  
 preceding year. Notwithstanding,  
 prices from the beginning to the  
 present time have held steady and  
 better than any preceding year. The  
 question now is how the season will  
 end with this abnormal supply. Eu-  
 rope would like to help us eat it, but  
 it is impossible to get it to her.  
 America should have dehydrating  
 plants which will handle this excess,  
 not only this year, but succeeding  
 years. We believe that before an-  
 other crop will need to be stored  
 there will be, to an extent at least,  
 means provided for handling the ex-  
 cess.

But in any case, let not the present  
 situation discourage future planting.  
 Some sections of California are al-  
 ready planting, but this is simply for  
 the out of the season crop at long  
 prices. The greater portion of the  
 crop, not only in northern states, but  
 in California, will be planted much  
 later.

Let potato growers take for their  
 own the motto of a large Eastern  
 grower: "The successful grower  
 plants every year, especially does he  
 plant heavily in the year of low prices  
 caused by heavy crops the preceding  
 year." His idea of planting in the  
 low-price year is that the shortsighted  
 planter acts upon the impulse of the  
 moment and almost always prefers to  
 pay long prices for seed when pota-  
 toes are high without stopping to  
 think that thousands of others will  
 think along the same lines.

## CHISEL TEETH

"There will come that day when the  
 world will say: 'This America that we  
 thought was full of a multitude of con-  
 trary counsels now speaks with the great  
 volume of the heart's accord, and that  
 great heart of America has behind it the  
 supreme moral force of righteousness and  
 hope and the liberty of mankind.'"

## This Week's War News

A two-ounce bread ration has been  
 ordered by Hoover in all restaurants  
 and hotels.

Swiss laborers are becoming resis-  
 tive and demanding demobilization of  
 the Swiss army.

Germans announce that they will  
 have the entire control of their west  
 front within the next six months.

All supplies of fuel oil in the Unit-  
 ed States have been placed under  
 control of the fuel administration.

The Italians and allies are continu-  
 ing to make the Italian front more  
 safe and even continuing advance.

Spain is vigorously protesting at-  
 tacks on Spanish ships by submarines  
 and demanding reparation for their  
 sinking.

The war is costing the United  
 States a cool billion dollars a month.  
 Four billions have been loaned by  
 America to its allies.

The president is still opposing the  
 war cabinet suggestion, and members  
 of congress are still insisting that it  
 will prove a means of speeding up the  
 war.

The chaotic condition existing in  
 Russia gives no immediate promise of  
 improvement. Conferences still con-  
 tinue at Brest-Litovsk. The Bolshe-  
 viki have succeeded in several attacks  
 upon the Ukrainians.

Washington has announced that any  
 brutality or unjust treatment toward  
 American men captured by Germans  
 will be met with swift retaliation upon  
 German prisoners in this country or  
 in the hands of American troops.

American artillerymen on the  
 French front were given a severe test  
 during the last few days, and, as near-  
 ly as can be learned, their effective  
 marksmanship and barrage fire pre-  
 vented attack by masked German  
 troops.

The Leviathan, formerly the Vater-  
 land, the largest vessel afloat, with  
 consorts of war vessels and accompan-  
 ied by nearly a score of other trans-  
 ports, has arrived in France with a  
 great force of American soldiers. Not  
 an accident occurred on the trip.

From rumors and best information  
 which can be had both by way of  
 Switzerland and Holland, the German  
 strike in munition plants and factor-  
 ies has been a most serious affair for  
 the German militarists. Many dis-  
 turbances have been shot, a strong hand  
 is being taken, and the city of Berlin  
 is under martial law.

The long heralded drive on the  
 French and Belgian fronts is still in  
 anticipation, although artillery actions  
 are becoming more frequent; the pres-  
 sure is increasing and the line tight-  
 ening; and it is anticipated that the  
 first satisfactory weather conditions  
 will give signal for the greatest mili-  
 tary action of all history.

The message sent by Berlin to the  
 German ambassador in 1914, which  
 specifically gave order to publish ad-  
 vertisement warning Americans in ef-  
 fect not to sail on the Lusitania has  
 been made public during the past  
 week and shows that Ambassador  
 Bernstorff had full knowledge, not-  
 withstanding his great "sorrow" at the  
 time.

The Germans have been given some  
 of their own medicine. That is, pre-  
 ceding the Italian drive the Italian  
 army was flooded with copies of pa-  
 pers which weakened the fighting  
 spirit of the Italian soldiers. It is now  
 said that leaflets have been scattered  
 by airmen over Germany, especially in  
 Berlin, which have aided in the recent  
 uprising of the German people.

# Agricultural News Notes of the Pacific Coast

## Northern California

Yolo County squirrel campaign started February 1.

A new cannery is to be erected at Martinez, Contra Costa County.

J. A. Teagarden has been named food administrator for Placer County.

A Placer County stock feeder has found excellent results from feeding rice straw.

Butte County planters are contemplating extensive plantings of cotton, largely experimental.

Ferndale, Humboldt County, is planning for a bigger and better agricultural fair to be held next fall.

The annual meeting of the California Grape Protective Association is to be held this week in San Francisco.

Gridley, Butte County, claims to be the largest live stock shipping point between Sacramento and Ashland, Oregon.

Truckee, one of the principal fruit icing stations on the Central Pacific, is having a most satisfactory harvesting season.

Experts of the pomological division of the University of California recently gave pruning demonstrations at the University Farm, Davis.

El Dorado County is organizing agricultural clubs in its high schools, two new ones having been recently formed at Goldville and Camino.

The main canals of Sutter and Butte Counties have been filled with irrigation water since late January and the earliest irrigations in these two counties are under way.

University farm management has shown belief in cooperation by uniting with dairymen of that section and reducing number of wagons or trucks hauling milk to creameries.

One of the largest sheep raising ranches in the state is to be installed near Chico, Butte County. Seven thousand acres have already been leased and nearly 10,000 sheep will be handled.

Eureka and other Humboldt County sections are appealing for more general road work, and the state commission now gives us to understand particular attention will be given to that county.

The Grange of Napa County has formally resolved: "We are unalterably opposed to the importation of Chinese labor. We favor such legislation as would result in forcing all idle men to assist in farm harvest."

The state colonization board is still appealing for cheaper, high quality land. Prices of all parcels submitted have been so high the board feels success of the farmers on the colony lands would be handicapped.

Contractors for the war department have been purchasing Sacramento Valley rice straw, contract for 4000 tons being the first signed. Another for 7000 tons will be made later. Some of this will be used in bedding for soldiers in Camp Lewis.

The post office department, or rather the postmaster at San Francisco, made a ruling that fish and game might be received by postmasters, mailed as parcel post. This was contrary to the state law, which contained a clause prohibiting such shipments. The matter has been taken to the supreme court, and ruling has been made that the California law stands.

## Central California

San Joaquin will plant between 5,000 and 7,000 acres of cotton.

The farm center at Armona, Kings County, is discussing live stock sales.

Porterville, Tulare County, is planting largely to deciduous fruits this season.

Fresno farm bureau is discussing a Patriotic Rally to be held late in February.

Notwithstanding keen demand for cotton seed in various valleys of the state, Commissioner Hecke is watching every shipment.

Railway people are appealing to orange growers who may need shook or other supplies any time during this season to make immediate orders.

A German has been arrested in San Francisco and held because of threats to dynamite controlling works of the Lindsay-Strathmore irrigation system.

The Kings County farm bureau is completing its organization and plans, as one of the first steps, to organize a series of community stock auction sales.

Stanislaus County Milk Producers' Association has commenced suit against dairymen for violation of contract. The concern is asking for \$15,000 damages.

County horticultural commissioners of various parts of San Joaquin Valley recently met and discussed with State Commissioner Hecke various aspects of cotton growing in the San Joaquin.

Merced County will materially increase output of beef for the next three years. One step in that direction is the recent purchase by large cattlemen of nearly 10,000 acres to use for live stock grazing.

Officials of the food administration are conferring with live stock men regarding securing cheaper feed. A series of meetings with food administrators are being held in various parts of the valley.

Fruit growers of California propose to fight to a finish patent claimed by a Michigan concern, the claimant for which demands immense tribute from the California fruit industry, because of the lye peeling process.

Farm center meetings are being held in various Fresno County sections to discuss "whether or not an irrigation district should be formed in the area covered by consolidated canals."

Farm Adviser Jungerman, Stanislaus County, announces meetings: February 6, Mitchell and Jennings; 7, Denair; 8, Tegner; 13, Thalheim; 15, Orange Blossom; 16, Fairview; 18, Wood Colony; 20, Hughson; 21, Patterson; 25, Keyes; 27, Claus.

The food commission has established as standard weights, 196 pounds net for barrel of flour, 49 pounds for a fourth of a barrel; and ordered that shorts shall be packed in containers with net of 80 pounds, bran net of 60 pounds, and rolled barley net of at least 75 pounds.

San Joaquin County farm bureau has organized a cream pooling association, cow testing associations, agricultural clubs, farm loan associations, Sudan growers associations, bean growers associations, milk producers associations and has investigated anthrax and some other troubles, to say nothing of holding jack rabbit drives and demonstrations.

## Southern California

Pomona is contemplating establishment of a large dehydrating plant.

It rained, very, very little in some sections of Southern California last week.

New olive processing plant has been established at La Mesa, San Diego County.

Riverside County farm bureau is getting into line with a marketing organization.

Los Angeles County farm bureau will investigate grain sorghums and cultural methods.

Riverside's display at the National Orange Show will consist of an immense battleship made of oranges.

Fumigators of citrus orchards are closing the season feeling that most satisfactory results have been secured because of favorable weather conditions.

J. M. Davison of Arlington has been made president of the Poultry Producers' Association of Southern California. This association is now capitalized at \$100,000.

Ventura County livestock men are discussing feed propositions and looking in every direction to secure rice straw or any feed which will carry stock over the drouth.

Yucaipa, San Bernardino County, people are beginning early on next fall's Southern California apple show. Directors are to be elected at the annual meeting this week.

The California state highway commission insists that trees along the state highway shall not be cut or mutilated unless written permit is secured from the commission.

At the meeting of the Orange County Producers' Association last week the old directors were reelected and a new year begun with over 500 acres additional cabbage signed up.

The Riverside County Fair Association has elected C. L. Lewis, president and Robert L. Taber, secretary for the coming year. Plans are in the making for a great exhibit in the fall.

The Riverside Mutual Fire Insurance Company expects to increase its insurance amongst farmers next year at least 300 per cent. A. E. Cox is president and C. P. Carl, secretary and manager.

Hemet, Riverside County, is looking ahead to next canning season and laying plans for sufficient help to handle the crop of apricots. The cannery is being enlarged to handle increased output.

Farm Adviser Parker of Riverside County has taken work with a large ranch in the eastern part of the valley and will be succeeded by A. L. Paschall, formerly farm adviser in Cochise County, Arizona.

Hemet, Riverside County, has a fruit industry and a cooperative cannery which are prime factors in the prosperity of the section. The people are now holding mass meetings and discussing housing and caring for the large number of helpers required in the canning season.

Bean shippers are concerned over the shortage of bean bags. Prices for coming season's delivery are 18 cents for 80 pound bags and 22 cents for 100. These are double the initial prices of '17. Spot price for today's delivery is 23½ cents. The association has not yet contracted.

## The Coast and General

Arizona produced 9,000,000 pounds of beans, mostly Teparies.

Farmer's week is being observed this week at University of Idaho at Moscow.

The entire wheat crop of France has been requisitioned by the French government.

Idaho hog men in session at Idaho Falls, appealed to the food administration for cheaper stock feed.

To prevent devastation from floods, farmers of Cowlitz County, Washington, are organizing a dike district.

The Farmers and Housekeepers meet at University of Arizona was a success, with 255 families registered.

Long staple cotton grown near Yuma, Arizona, was declared to be superior to that grown in the Sea Islands.

The executive board of the Northwest Livestock Association has decided to hold the 1918 show November 7 to 13 inclusive.

Only the very poor and men and women doing the hardest kind of work may have more than seven ounces of war bread a day in France.

The Farmers Union Mill and Grain Company, Tacoma, Washington, is constructing an elevator with a capacity of 75,000 bushels to cost \$10,000.

French war bread comprises all the elements of wheat except bran, with a heavy admixture of flour from other cereal grains. This admixture is obligatory.

Six cars of apples recently billed from Yakima, Washington, are under observation of department of agriculture experts who are testing various shipping methods.

British Food Controller Rhondda declares, "The food position of England, and as I understand it in France also, can now without any exaggeration be described as critical and anxious."

The Colorado State Beekeepers' Association recently met at Fort Collins and discussed the honey industry and elected W. P. Collins, president, Wesley Foster of Boulder, secretary.

A cow testing association with headquarters at Stillaguamish, Washington, shows an average of milk per cow during December of 550.7 pounds and of butter 26.73 with an average cost of feed of \$7.79.

About October 1, 1917 butter was selling in Berlin at \$2.25 per pound, sugar at 56 cents per pound, and ham and bacon at \$2.11 per pound. This information was received by the United States food administration through a reliable source.

With storage for hides more than filled, and with profiteering in tanned leather such that reports insist that more than 400 per cent increase in profits is secured, the wearer of shoes is forced to form the resolution that he will go barefooted.

An organization of members of the Grange, Farmers Union and labor organizations was recently formed at Portland. It is proposed that the state legislature shall be reduced to 30 members; that the state's natural resources shall be used for the common good; that there shall be established an effective state marketing system, with other features such as anti-injunction, compulsory compensation for all labor, etc.

## The Heart of The Milking Machine

**THE** pulsator is the heart of any milking machine. It controls and regulates the action of the teat cups on the cow's teats.

A man with a weak heart would not be accepted for military service. You should not accept any milking machine with a weak heart. The Perfection has the heart of an athlete. His heart beats are strong and steady. He can stand lots of work and thrives on it. The Perfection pulsator is simply a piston working back and forth in a brass cylinder, no cog wheels, weights, levers or "clock work." It does not easily get out of order, and with ordinary care it should outlive any other piece of machinery on the farm. The Perfection milks as the calf does, with a gentle suction, a downward squeeze, followed by a period of complete release. The pulsator can be instantly adjusted to suit either a hard or easy milking cow. This point is a very

important one. Not all cows milk alike and the Perfection recognizes this fact.

The action of the Perfection on the cow's teats, which is nature's way, and the possibility of adjusting the machine to suit different cows are two of the many points in which the Perfection excels all other milking machines.

Newman Bros., Elk Grove, Cal., write:

"As you know we produce certified milk and would not be allowed to use any machine that would injure a cow's teats or udder or adversely effect the bacteria count. We have milked entirely by machine for about two years with perfect satisfaction to all concerned, including the cows. One man with ordinary intelligence is doing with the machine what it required three men to do in the old way. We would convict ourselves of being either philanthropists or fools were we to go back to the old way. We are familiar with most makes of milking machines and have tried out several of them. The Perfection is superior in several respects. First: Both suction and squeeze can be changed instantly and adjusted to the individual cow. This is a mighty good thing, as any milker ought to know. Second: The Perfection will milk more cows in a given length of time. Third: The Perfection pulsator is more simple; has fewer wearing parts and is easier to adjust. Fourth: The teat cup rubbers last much longer than on one other machine which we tried. I cannot understand the dairyman, who modern in every respect, will go on milking by hand when he could cut expenses and make dairying more attractive, to say nothing of sanitation, by using a Perfection Milking Machine. When we need more milking machines, the order is yours."

## Mohair

By Geo. W. Barnes, Arizona Livestock Specialist

**BY** FAR the most important goat industry in the state is the Angora grown under range conditions for the mohair. The fine long, white, silk hair was at one time used exclusively for the manufacture of ladies' fancy dress goods and in the manufacture of plushes. By being so largely used for this purpose only, the price of mohair depended to a large extent upon the fashions and the price thereof fluctuated greatly from year to year.

At the present time it is used in the manufacturing of various articles such as belting, wings for aeroplanes and in various forms of cloth.

The price per pound depends upon the length, strength, freeness from kemp or coarse hair, and fineness of the fibre. Fifteen inch fibre has been known to sell for from \$8 to \$10 per pound. The average length for mohair raised under range conditions will average between eight and ten inches and brings from 50 to 75 cents per pound. The demand at the present time for mohair in the United States for manufacturing purposes is far in excess of the amount produced.

In growing Angora goats for mohair the does should be 15-16 Angora and to still improve the value of the offspring and product pure bred bucks should be used, for the price of mohair depends to no small degree upon the length and fineness of the fibre.

Methods usually suggested for building up a band of Angoras is to purchase pure bred bucks and cross them upon the common white goat. Any other color is quite objectionable. Those who have had experience in this work report that the short hair

ones are to be preferred because the long coarse hair continues to be transmitted to the offspring, which greatly decreases its value. By the use of first class bucks the breeder should receive a 100 per cent kid crop because many of the common goats will have twins. They reach maturity when about 18 months old, but will breed when six months of age. The first crop of kids received will be half Angora; by crossing these kids to pure bred Angora bucks the offspring will be three-quarters Angora, and about the fourth cross one may expect to secure a good grade of mohair.

Upon further examination of this method of securing a producing band, it is found to be a slow process and more expensive than would appear at first, because many years are being taken to secure this fourth cross animal. Out of the 100 kids which are secured from the 100 does, 50 no doubt will be males; this leaves only 50 half breed females to secure the three-quarters bred animals, and 25 of the offspring from them will only be three-quarters blood, and so on until the fourth cross there will be only about six or seven females. In many cases this will be the only way to secure a start, and the band during the developing period will have three or four different grades, but by keeping

Angora goats are useful in cleaning up brush land. The flesh is palatable and nutritious. The price for mohair is good and the demand great. On the forest reserves they are being used to clear the forest of underbrush, browse and weeds which cattle do not eat.

## How to Correct Bitter Milk

Two Cultivator Subscribers Describe Their Methods

I have been reading the Cultivator since I came to California 14 years ago and always welcome it to our home every Friday. I have got lots of suggestions from the contributors; so far I have given nothing back. Now I have just read of the dilemma of subscriber at Hynes with that bitter milk. I will be brief and say I don't know what causes it but I can tell how to remedy it.

As soon as you bring in your milk strain it in any vessel large enough to contain it. Set it on the fire and heat it until it is uncomfortable for your finger in it, then strain it in the pans and put it in milk house for cream to raise. If the cream is crinkly you had

it hot enough, if not make it a little warmer next time. This kills the germs in the milk that give it the bad taste. Keep stirring the milk while you are heating it. You can use your own pleasure about washing your finger before you use it as a thermometer.—C. P. Emerson, Gardena.

We noticed in the Cultivator of January 26 a question regarding cause of bitter milk. We wish the inquirer might know how we overcame the trouble of making poor butter from such milk.

Last winter we had similar trouble and it was renewed again this winter. We solved the problem by straining

A Steybrae Ayrshire

Kintyre Laird  
A leader which has added to the Santa Anita Berkshire quality.

the milk and at once heating it over the fire to the scalding point, or 150 degrees Fahrenheit (using a dairy thermometer to test it. Even if it runs higher than that it will do no harm. Then remove from the fire, pour in pans or crocks and set to cool uncovered. When ready to churn the cream will not need to be soured but

butter will come quickly. However, there may be white flakes of milk or curd among the butter, but this will all wash out readily and the butter will be sweet and good. At least that has been our experience. As soon as warm weather comes we find the trouble is over, and we no longer heat the milk. — Mrs. J. F. Delzell, Lindsay.

## Venadera Herd R. M. Cows

Guy H. Miller of Modesto writes: "I wish to report yearly authenticated tests recently completed in Register of Merit testing in Venadera Herd of Jerseys.

"Zama of Venadera started test at 23 months of age; for the year she gave 7,575 pounds of milk, average test five per cent, making 378 pounds of butter fat; was milked 359 days. She is a daughter of Belle of Venadera, Register of Merit test 462 pounds of fat. Martha of Venadera started test at 23 months of age; for the year gave 5,450 pounds of milk, average test of 5.75 per cent, making 315 pounds of butter fat. Martha is a daughter of Annette of Venadera, Register of Merit test 429 pounds of fat in 357 days. Annette is on test again and will finish in a few weeks. She is one of the seven Register of Merit daughters of Anita of Venadera, who holds the world's record for cows in number of Register of Merit daughters with yearly records. These two heifers, Martha of Venadera and Zama of Venadera, are sired by Owl of Belleview, a bull of the noted Owl and Oxford Lad families that was used in

Venadera Herd before being purchased by Professor True to head the Jersey herd at the University Farm at Davis. Owl of Belleview now has five daughters that have qualified for the Register of Merit as two year olds in Venadera Herd. Goldie of Venadera, one of our native cows, recently finished third yearly test. For the year she gave 12,195 pounds of milk, average test 499 per cent, making 598 pounds of fat, equal to 704 pounds of butter 85 per cent fat. Goldie has a Register of Merit test of 469 pounds of fat in a year, made as a three year old, and another of 534 pounds of fat made as a five year old. Like the other cows that have been tested in Venadera herd, she was milked and fed twice daily while on test. She was also taken to the state and county fairs while on this test, winning grand championship at Modesto fair. Goldie is one of the 14 Register of Merit daughters of the grand old bull Marigold's Exile King that headed Venadera Herd for several years, and her dam is Margery Golden, Register of Merit test 459 pounds of fat, dam of two daughters in the Register of Merit.

## Grazing Privileges Must Not Be Sold

The secretary of agriculture is notifying all holders of permits for grazing livestock on the national forests that the payment of any bonus or allowance for waiver of the grazing privilege in connection with sales of livestock or ranch properties will be cause for revocation of the permit.

Owing to the great demand for use of the forest ranges, which is now in most regions far beyond their capacity, the grazing privilege is of large value. In the view of those in charge of the national forest grazing business it would be entirely unfair for the public to forego a maximum return for the value of use of its property and then allow those granted the privilege of use to collect this value from others as the price of surrendering their privileges.

As Secretary Houston says in warning the range users that the payment of bonuses or the giving of any consideration to secure the filing of a

waiver of the grazing privilege is prohibited, "such a payment would be a consideration for a privilege the granting of which is wholly within the discretion of the government and for which no one is entitled to receive compensation." Therefore any such payment will be "sufficient cause for the revocation of permit or forfeiture of all grazing preferences based upon the purchase of permitted stock."

### DAIRY COMPETITION FOR CALIFORNIA CULTIVATOR PRIZES

### Spinal Meningitis

A mare seemed to have dis-

temper in a light form, from which she seemed to have recovered. Next I noticed her breaking down in the fetlock joints. She was very nervous but ate and drank. She lay flat most of the time and could raise her head only enough to drink out of a pan. Running sores formed on the side of the head and on the shoulder. She lost her colt after being down about five days and at the end of 14 days she was so bad we had her destroyed. What was the trouble? Was it contagious and could it have been cured?—Subscriber.

The trouble is known as spinal meningitis or forage poisoning. It is due to a fungus or mould on the grass or hay. Isolated cases are seen over the country and occasionally there

are epidemics when many horses will be lost in one county or state. It seems to produce some change in the system that causes congestion of the coverings of the nerves and spinal cord. By continuing to eat the same feed the disease is increased, besides, when once introduced into the stomach and bowels it seems to increase there. As you noticed, the animals remain conscious and rational, only losing control of the muscles. When the disease is first noticed there should be an entire change of the feed and the bowels thoroughly emptied. Probably the best remedy to use in emptying the bowels is salts and nux vomica. By mixing three pounds of epsom salts, one pound of common salt and one ounce of the powdered nux vomica, dividing this into ten powders and giving one powder every eight hours until the bowels become very loose you will not only remove the trouble from the system but at the same time build up the nerves and spinal cord.

The horse should be kept on his feet by supporting him with slings because when once down they seldom recover. One case on a farm indicates the presence of the fungus on the grass or hay and careful watch should be kept on the other horses to stop further loss. Half dram doses of the iodide of potash in the drinking water twice a day also helps to drive the trouble out of the system.

### Growth in Cow's Teat

About three months before cow came fresh she developed something in one of the back teats that retarded the milk from coming down freely. At the first stroke in milking the teat emptied and it would take a minute for it to fill up again. The milk seemed near normal at first but is getting a little thin now. The calf can not get the milk and the quarter is getting a little hard and tender. What can be done for it?—Subscriber, Fresno.

There is a growth in the teat just where it leaves the udder that nearly closes the duct. No one knows the cause of such growths, but they are found frequently, and sometimes they close the duct. You should use a milk tube and draw out all the milk twice a day until the swelling and soreness has entirely subsided, then the growth should be cut by passing a small instrument that has a concealed blade in it through the opening in the teat, and when the growth is reached the blade can be pushed out and growth cut in pieces. This is a delicate operation and should be done by one who knows how to handle the instrument. This usually results in clearing the duct and restoring the teat to normal, but sometimes it sets up an increased inflammation and makes matters worse and the quarter may be lost. If left as it is the quarter will surely be lost. You will have to decide whether you will try it or not.

### Influenza

My horse has had a cold for about ten days. He coughs and runs at the nose very badly. He eats and the bowels and kidneys act but not as freely as usual. He hangs his head down and stands quietly. Have given him two tablespoons of tincture of ginger in a cup of hot water and rubbed a teaspoon of tar on his tongue twice a day. Have kept him well blanketed at night but he does not seem to be improving. What remedy would you

advise for him?—Subscriber, Long Beach.

Probably it is a case of influenza. In cases of that kind it would pay to employ a veterinarian because the same remedies will not do in all cases of influenza. Delays are dangerous and if neglected it may become a case of pneumonia, and that requires careful treatment that you could not give. We believe it best not to suggest remedies in such cases as this.

### Sow with Sore Teats

We have a sow with nine young pigs nearly ready to wean. The sow's teats are very sore, inflamed and swollen. Her breasts are scabby and she gives very little milk so the pigs are very poor. What is best to do about it?—Subscriber, National City.

Wean the pigs at once. They will do much better if fed sweet or sour milk with some middlings in it. Bathe the sow's teats once a day with warm solution of permanganate of potash, one ounce to the gallon of water.

### Abortion

Last July I purchased a cow that I was told was about four months with calf. She came in heat and was bred on September 16 and on November 19 she aborted twin calves. She was bred again and aborted again. What can I do to prevent this trouble and do you think the man I purchased her from should be held responsible for my loss?—Subscriber, Santa Ana.

This is rather an extreme case. The man who sold you the cow may have known something about the trouble and may not. He justly should bear part of the loss; but he may not think so. It may be contagious abortion or may be caused by tuberculosis. First we would advise having her tested for tuberculosis. If that is the trouble she is not worth breeding again. If she is free from that then let her rest for a few months, and in the meantime give one ounce of the tincture of iron in the feed for two weeks and also try some of the remedies recommended for curing contagious abortion.

### SAUSAGE RECIPE

A writer in Home and Farm of Des Moines gives suggestions to those who wish to work up a fancy sausage trade in town. Under farm conditions, for farm consumption, sausage is generally made out of the waste meat, in which there is considerable fat. The surplus sausage is generally fried down in crocks or else smoked. However, during the winter, sausage will keep at a moderately cold temperature, with no other treatment than mixing with salt, pepper, etc., as suggested.

Sausage is generally made from the lean parts of the shoulder and neck, and the lean trimmings of the rest of the body. Practically the whole hog may be ground up into sausage if desired, but it is generally found more profitable to eat the tenderloin fresh, and to cure the hams and bacon. To make a high grade of sausage, it is wise to use only the leanest meat, which has been well cleaned of fat, sinews, tendons, etc. There is a great difference of opinion as to how much fat should be added to the lean meat. For the very best sausage, it seems to be customary to use only one pound of fat for each 15 or 20 pounds of lean; but in ordinary sausage, they often use one pound fat for each three or four pounds of lean meat. The fat and lean are finely chopped in a mincing machine, and then seasoning is added according to the taste. It is wise to add only a little seasoning at first, and try out a little of the mixture on the stove, to see if it is about right. As a preliminary, we suggest that for each ten pounds of sausage there be used four ounces of fine white salt, one ounce of ground black pepper, one-fourth ounce of whole pepper, one-half ounce of sage, and possibly a half ounce of sugar. Sometimes other spices than those mentioned are also added. After mixing in the spices, some grind the sausage again, in order to secure a more intimate mixture. To make the very best sausage, some claim that only the lean pork from old hogs should be used, the flesh of pigs eight or ten months old not being firm enough to make the best sausage unless some beef is mixed with it.

## Second Sale of Holstein Bulls at Gonzales

In January, 1917 California Breeders Sales and Pedigree Company held what is believed to have been the first sale of registered Holstein bulls ever held in this country, at Gonzales, a district almost entirely farmed by Swiss-Italian dairymen. At that time 19 well bred, carefully selected, fully guaranteed bulls were sold at public auction at an average of \$206 per head, a very large percentage of them going to dairymen who had never before owned a purebred sire.

Another sale of similar character was held by the same company at Gonzales on January 19 this year, when 24 good young bulls from the herds of The J. S. Gibson Company, Williams, Toyon Farm Association, San Jose, Henderson Company, Sacramento, Palo Alto Stock Farm, Palo Alto, Dr. E. J. Weldon, Sacramento, and A. W. Morris & Sons, Woodland, were sold for an average of \$143.50 per head. Quite a number of

dairymen who were buyers last year were buyers this year, and again a considerable number of bulls went into herds where a purebred sire will now be used for the first time.

Estimating results by the immediate returns from this sale, it was not a profitable one for the breeders who consigned. Nine of the bulls were under one year old, and the other 15 were yearlings, and considering the fact that the expense of conducting a sale of this kind is unusually high the net returns are hardly attractive.

The community in which these bulls were sold stands to benefit in a large way through the use of these better sires, and it not unreasonable to figure that the benefits to be derived in the future will more than offset the low returns to breeders in this particular sale.

It was a very noticeable fact that interest in the bulls was even greater than last year, many dairymen who did not buy in either sale going over the bulls carefully. Another feature of the event came the day before the sale when Principal Bert H. Carner of Gonzales Union High School invited Sales Manager C. L. Hughes to appear before the agricultural club of the school to make a short talk on Holstein pedigrees and breeding and judging. Upward of 20 boys attended the demonstration and one of them made a keen selection in the purchase of a young bull the following day.

Upwards of 100 dairymen from as far north as Gilroy and as far south as Paso Robles attended the sale, and several interested Holstein breeders were also present.

The top price of the sale was \$240 paid by J. Bernardini & Company for the yearling Toyon King Pontiac Wayne, consigned by Toyon Farm Association. The dam of this bull has an official record of 25.34 pounds butter in seven days as a three year old and is a most promising candidate for a higher record at next freshening.

Twenty-nine bulls had been catalogued for sale, but owing to minor injuries and the missing of a train by one consignment, only 24 were in the sale. Following is a list of the bulls sold with name of buyer and price: A. Rianda, \$200; P. Rheinholdt, \$125; Henry J. Pura, \$225; J. Wishman, \$75; Frank Corda, \$190; J. Pimental, \$65; Frank Vosti, \$60; John Foletta, \$145; Joe Bianchi, \$125; Frank Corda, \$150; V. J. Lanini, \$175; Peter Barlogia, \$120; B. F. Conner, \$140; W. H. Moore, \$175; A. Gubser, \$180; Pura Bros., \$200; Chas. Bedolla, \$100; Alfred Clark, \$100; Ricca Bros., \$160; Clark & Marzorini, \$105; J. Bernardini & Company, \$240; L. H. Anderson, \$155; James Rianda, \$110; Clark & Marzorini, \$125. The auctioneer was Col. Ben A. Rhoades, Los Angeles.

### GREAT THREE YEAR OLD

Aralia De Kol Pontiac Mead, daughter of Aralia De Kol Mead, has now to her credit a wonderfully good seven day official record. She has now been in milk about 30 days after completing the California yearly record for senior two year olds of 934 pounds butter. She went through a very severe experience at calving and did not start off in promising form. But as she gradually recovered normal condition she responded with increased milk flow and now has to her credit as a senior three year old 33.25 pounds butter in seven days and is still gaining. She is sired by Segis Pontiac De Kol Burke, son of the former world's record cow Riverside Sadie De Kol Burke, and is the first and only bull in the world whose seven nearest dams average over 1000 pounds butter in one year. She was bred and is owned by A. W. Morris & Sons Corporation, Woodland.

### DUROC JERSEYS

Sows, gilts and a few boars of the best breeding FOR SALE  
L. P. Slocum & Son R 1 Willows, Cal.

-better alfalfa!  
-bigger yields!  
-more food value!  
-more profit!

*Germain's*  
**Hairy Peruvian Alfalfa**

-Plant it now  
and get 2½ more tons  
per acre!

Wideawake ranchers have discarded the old types of alfalfa and are growing Germain's Hairy Peruvian exclusively—because it produces 2½ more tons to the acre than common alfalfa. The superintendent of the Arizona Agricultural Station says, "Hairy Peruvian produces heavily in all climates practically the year round. Gives farmer maximum yield from his land. The plant is heavily leaved, thus giving highest food value. We recommend it above all other types."

Make your land produce to the utmost — plant this wonderful alfalfa. Write for descriptive circular containing testimonials.

## Field Notes from the Live Stock Men

Jean Armour, 25487 is one of the greatest Ayrshire cows of the country. She is the first Ayrshire cow to produce over 20,000 pounds of milk; her official record, which also made her breed champion, being 20,174 pounds milk, 774.73 pounds butterfat. In her fourteenth year she produced 18,382 pounds milk, 716.36 pounds fat. She died last month. It was asserted that this cow made more Ayrshire history for herself and offspring than any other. She was born October 19, 1901.

Every Jersey breeder who is intelligently following the progress and development of the breed needs a copy of the 1917 Register of Merit. The book is in a new form, giving the names of each sire with tested daughters with records of daughters and ages at which records were made. Also for the first time the volume contains the names of dams that have produced Register of Merit daughters and sons, with production records of the daughters. This volume contains the greatest amount of easy-to-refer-to information on Jersey records yet published. Copies can be secured for \$2.25 postpaid from The American Jersey Cattle Club, 324 West 23d Street, New York City.

Barnyard manure has been the subject of long and exhaustive experiment by the University of Missouri agricultural college, and it was determined that its fertilizing value ran as high as \$4.10 per ton. In all tests made the returns averaged a value of \$1.90 per ton. Used in combination with phosphate several fields proved unusually profitable.

Official Yearly Records of All Dairy Breeds, including all records of registered cows completed to date were recently summarized by the United States department of agriculture. The summary shows that 3220 Holstein cows have records averaging 14,622.7 pounds milk and 500.7 pounds butter fat in one year; 6200 Guernsey cows have records averaging 8934.44 pounds milk and 446.01 pounds butter fat in one year; 199 Brown Swiss cows have records averaging 10,868.7 pounds milk and 433.45 pounds butter fat in one year; 5244 Jersey cows have records averaging 7792 pounds milk and 417 pounds butter fat in one year; and 2598 Ayrshire cows have records averaging 9555 pounds milk and 377.51 pounds butter fat in one year.

Margaret Aralia De Kol, five year old daughter of Aralia King and out of a daughter of Juliana King of Riverside, recently completed an official record of 25.42 pounds butter in seven days eight months after calving in the herd of A. W. Morris & Sons Corporation. This record gives the grand old cow Aralia De Kol the distinction of having been the only cow in the world with a record of 25 pounds butter in seven days eight months after calving that has a daughter and a granddaughter each with official records above 25 pounds butter in seven days eight months after calving. Thus does the official record establish one of the foremost families of persistent producers in the Holstein breed.

Gotshall & Magruder, Ripon, have recently made some good sales from their herd of registered Holsteins. To H. A. De Wolf they sold the females Mooresta Pontiac of Vina and Lady Vale Segis; to R. E. McCracken the young bull Segis Skylark Karlay; and to Christensen & Nielsen the young bull Sir Pontiac Jane Karlay. They also sold a bull of exceptional blood lines to J. P. Compton & Son of Washington. This young bull is Pride Fayne Valdessa, sired by FINDERNE Pride Fayne a son of King Hengerveld Aaggie Fayne and the former world's

record cow FINDERNE Pride Johanna Rue, 36.87 pounds butter in seven days, 1470.59 pounds butter in one year. The dam of Pride Fayne Valdessa is FINDERNE Valdessa Korndyke, 20.84 pounds butter in seven days as a three year old, and she is by King Pontiac Segis Korndyke and out of Valdessa Scott 2nd, 41.88 pounds butter in seven days, 164.29 pounds butter in 30 days.

Waste is unpatriotic and what a vast number of livestock farmers there are who are for the most part unconsciously wasteful. One of the greatest wastes in livestock farming is made possible through the continued use of scrub sires that are not qualified by inheritance to sire offspring that will economically convert grasses and grains into meat, milk, and butter for human food. A pure bred sire in your herd is one of the best emblems of patriotism, not to mention the best kind of insurance for profits.

Final figures for the official records of two four year olds recently tested at Tulare Holstein Farm, owned by W. J. Higdon, Tulare, give Blanche Nudine Clothilde 2nd 523.1 pounds milk and 28.02 pounds butter. Princess Wynima Pontiac, owned by H. E. Vogel, Fresno, made 510 pounds milk and 21.39 butter. Both are granddaughters of King of the Pontiacs.

R. F. Guerin, Visalia, will sell all his registered Holsteins of breeding age at public auction on his farm on Thursday, April 4, 1918. This has been one of the leading herds in California for years, a herd that has earned very substantial prosperity for its owner. Mr. Guerin will keep all the heifer calves, all of which are daughters of his splendid young herd sire, Sir Veeman Korndyke Pontiac, a 30 pound son of Sir Veeman Hengerveld.

Henderson Company, Sacramento, have secured the services of Harry Smith as herdsman for their big herd of registered Holsteins. Mr. Smith is one of the most favorably known Holstein herdsmen, under his care one 44 pound record, one 40 pound record, and a large list of 30 pound records having been made. He is enthusiastic about the quality and prospects in the Henderson herd and is confident that they will demonstrate their production through some really great records.

There is an unassuming and enthusiastic young man in Yolo County California, the results of whose care have been heralded far and wide, and his name never mentioned so far as it may be understood that he is a member of the corporation. This young man is Asa Morris, Jr., the man under whose care Aaggie Acme of Riverside 2nd made her 35 pound seven day record, her world's record for a year, Changeling Tily Abberkerk Gem made her 34 pound seven day record, Aralia De Kol Pontiac Mead made her senior two year old yearly record of 934 pounds butter, the California record, Miss Valley Mead De Kol Walker made her world's record eight months after calving, Aralia De Kol Mead and Margaret Aralia De Kol made their 25 pound records eight months after calving. Aralia De Kol Pontiac Mead made her 33 pound senior three year old California class record, and last but far from least, Tilly Alcartra made her wonderful record of over 40 pounds butter in seven days. Besides this he is carrying Aralia De Kol Mead on strictly official test for a year and she will finish well up to 1200 pounds butter. Yes, Asa Morris, Jr. is a mighty busy member of A. W. Morris & Sons Corporation, and added to his energy he seems to have that rare gift of knowing cows.

## THE BEST LINIMENT

OR PAIN KILLER FOR THE HUMAN BODY

Gombault's

## Caustic Balsam

IT HAS NO EQUAL

For — It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Bolls, Corns and Bunions CAUSTIC BALSAM has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

### Whittier State School

WHITTIER, CALIFORNIA

### Easy Milking and a Full Pail

are the natural result of a healthy udder. When a cow freshens, her udder should be given careful attention. Caked lig., so likely to occur then, is quickly removed by applying Bag Balm, the great healing ointment. Sores, cuts, chaps, bruises, cracks, bunches and inflammation quickly respond to its healing, penetrating effect. Try Bag Balm and you will never be without it.

Sold by feed dealers and druggists, in large 50c packages. Send for booklet, "Dairy Wrinkles."

DAIRY ASSOCIATION CO., Lyndenville, Vt.

### HEREFORD AND SHORTHORN SALES

D. O. Lively writes of two sales soon to be held:

"The Pacific Coast Hereford Cattle Breeders' Association will hold a combination sale at the University Farm, Davis, on Wednesday, April 10, 1918. This sale will be made up of contributions by number of the Hereford breeders of California and from states on the Pacific coast. It is limited to 75 head, 40 head of which will be females and 35 head bulls. A committee will pass on the merits of all the animals offered in the sale, thus guaranteeing to attending bidders absolutely worthy specimens.

The day following the Hereford sale there will be a combination Shorthorn sale in San Francisco. Fred Reppert, the great livestock auctioneer, will officiate in the box at both events.

There never was a time when good blood in livestock was so important as now. Secretary Kinzer of the American Hereford Breeders' Association and a number of the prominent Eastern breeders have said they will be in attendance at the sale.

### GREAT BULL

That Sir Skylark Ormsby Hengerveld 39138 is a great bull is shown by his record as sent to us by Geo. A. Smith & Sons, Kings County breeders of Holstein-Friesians. Here is the record of his daughters:

The record of one daughter for seven days is 34.208 pounds of butter. The average record of five daughters for seven days is 30.537 pounds of butter; 12 daughters, 27.147 pounds; 18, 25.177 pounds; 24, 23.344 pounds. (Twenty-four being the total number of his tested daughters.) The record of one daughter for 30 days is 132.871 pounds. The average of five daughters is 114.885 pounds. The average of seven daughters is 107.05 pounds. His only daughter tested for one year made a record of 1127.27 pounds. His only daughter tested for one year made a record of 27,804 pounds of milk.

He is the only sire on the Pacific Coast to have two 30 pound daughters and a 30 pound granddaughter, all under full age.

The highest average records for seven days of five, 12, 18 and 24 of his daughters are the highest of any bull on the Pacific Coast. The highest average records for 30 days of either five or seven of his daughters are the highest of any bull on the Pacific Coast. Five records in the above averages were made by cows under full age.

### FEED DEALERS MUST HAVE LICENSE

We have received from Joseph Magner of the United States Feeding Industry Committee copy of the proclamation issued by the president on January 10 from which it is noted that all persons subject to license because of handling stock feeds must apply to the United States Food Administration, Washington, D. C. for blank forms prepared for this special purpose. Those who are subject to the license must secure license before February 15 or be liable to penalty. From the proclamation we quote as to those subject to this license:

"All persons, firms, corporations, and associations engaged in the business of (a) importing, manufacturing (including mixing and processing of all kinds), storing or distributing any commercial mixed feeds (including dairy feeds, horse and mule feeds, stock feeds, hog feeds, and poultry feeds); (b) manufacturing feeds from

Shorthorns on Dress Parade at Montana Fair

any of the following commodities or importing, storing, or distributing any of the following commodities as feeds or feed ingredients; buckwheat, kaffir, milo, feterita, broom corn, cane seed, spelt, emmer, sunflower seed, grain and seed screenings, lentils, linseed-oil cake, linseed-oil meal, beans, peas, dried brewers' grains, dried distillers'

grains, dried yeast grains; malt sprouts, baled hay, baled alfalfa, baled straw, animal or fish products, tankage; (c) importing, manufacturing, storing, or distributing as feed any products or by-products of any of the following commodities except products or by-products whose importation, manufacture, storage, or distri-

bution is already covered by a license held by any such person, firm, corporation, or association; shelled corn, ear corn, oats, barley, wheat, rye, buckwheat, sorghum grains, rice, grain and seed screenings, soya beans, velvet beans, peas, peanuts, copra, palm nut, palm kernel, sugar beets, sugar cane, hay, alfalfa, straw."

# Here's the Biggest Money Maker You Can Put on Your Farm!

That's a stout statement, but the facts bear it out. There isn't another implement made that will bring you as great return for the cost and the work as a good spreader will. You know that the question of fertility of your land is at the bottom of your success as a farmer. You cannot keep on taking crops from the soil unless you restore the fertilizing elements.

Fertilizing elements go straight down. They will not spread themselves. Therefore, if you are going to get bumper crops, you have to put manure over every inch of the soil. You can't do that by the old pitchfork and wagon method, and you can't do it with many of the spreaders offered.

I've been building manure spreaders ever since I was fifteen years old. I sold over two million dollars worth of them last year, and every one of them is giving satisfaction today. I've learned something in all these years about these machines, and I've put everything I know into building the

## NISCO

### The Original Wide Spreading Spreader

Look at its wide distribution—seven feet at least. It was the first wide spreader, and it has always held the lead. Look at the way it pulverizes the manure—so fine that you can safely scatter it over growing corn. Can you do that with any other?

Then it's light draft—easy for the team. It's low down—easy for the men. You can load the bed thirty inches high, and scatter 3, 6, 9, 12 or 15 loads to the acre.

Let me tell you that without a Nisco Spreader you are wasting your most valuable asset—the fertility of your land. With a Nisco standing where you can throw the manure from the stalls right into it, hauling it on your fields as soon as it is full, you are getting every dollar's worth of crop food right where it is needed, at the least labor, just when it is needed.

Ask any county agent, any experiment station man, what right distribution of manure will do for you.

I haven't exaggerated a bit. Thousands of good farmers have proved it themselves. Thousands know it pays to use the right kind of spreader, and that the Nisco is right in every particular.

Stop wasting your fertilizer! Feed your land and get more out of it! Let me send you my book, "Helping Mother Nature," which tells the facts about manure, and full description of the peerless Nisco, a money maker for your farm.

See the machine at the Nisco dealer's. If you don't know him, we will send you his name.

B. C. OPPENHEIM, Mgr.

**HOGS**

**The Billiken Brand of Chester Whites**—There is right now a big shortage of swine in California. The output of 1917 will show even a greater shortage unless the farmers of this state get busy and raise more hogs. Good breeding stock is scarce and hard to get. **THE BILLIKEN BRAND** represents the best obtainable; they are of that mellow type that mature early and are such satisfactory easy feeders. Get started with this strain and help out the Food Administration and your own pocket as well. Write me your wants—do it today. I can still furnish first class animals at reasonable prices. C. B. Cunningham, Mills, Cal.

**Grape Wild Farm Berkshires and Guernsey Bull Calves**—Only a few more boars left from 6 months to a year old, sired Grand Leader 2d, the Grand Champion of the world. Also a few of the tops from our fall litters by Royal Superbus and Fashion Longfellow 27th, and a few bred gilts. Our herd won the Premier Breeders' Ribbon at the P. P. I. E. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

**Bernsteins Herd**—"One of the Best in the West" has three great herd boars. King's Big Bone Leader, Young Jumbo, and King's Massave Orange. Watch for the sensational offering of sows bred to this great trio which sell in the Big sale of the Kings' County Poland-China Breeders at Hanford, February 20. Bernsteins Ranch, Hanford, Cal., W. Bernsteins, Proprietor.

**Large Type Poland-Chinas**—The hog for the farmer if he wants to make money. I have the best lot of weanlings that I have ever seen and they are sired by my boar, Long Smooth Jumbo and if he keeps on growing the way he is, his name will soon be too small. H. Christiansen, R. D. 4, Riverside, Cal.

**Superba, World's Grand Champion Poland-China boar** and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

**Duroc-Jerseys**—Sold out of bred gilts. Two service boars. One of them an outstanding individual for sale. Also Fall Pigs, both sexes. Twenty-three ribbons on 11 entries, including 6 champion-ships, State Fair, 1917. Frederick M. Johnson, Napa, Cal.

**Berkshires**—First prize junior boar; first and second senior boar pigs including junior champion; fifteen spring and fall open gilts sired by Ames Rival 116, champion boar; and two junior yearling bred sows priced cheap for immediate sale. F. D. Hall, Perris, Cal.

**We Pay Cash for Hogs of All Sizes**, weights and breeds. Any number from one to several thousand considered. What have you? Durbin and Forbes, 722 San Fernando Building, Broadway 4170, Los Angeles.

**Duroc-Jerseys**—The blood of champions such as Defender, Orion Chief, Taxpayer "13," Golden Model. A few choice fall gilts of Grand Champion Breeding at reasonable prices. T. R. Bond, Tipton, Cal.

**Large Yorkshires**—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

**Recorded Poland-China boar**, 18 months old, sired by Superba. Bargain at \$50.00. Immured, and tried breeder. C. R. Hanna, Riverside.

**PLW Durocs**—Eastern selections made by R. K. Walker in January. Peters, Lamson & Walker, Devore, San Bernardino County.

**Large Type Poland-Chinas** are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, Cal.

**Rancho Rubio Durocs** all sold out except some choice fall boar pigs. Write for prices. Elmer Lamb, Ceres, Cal.

**Should Like to Dispose of 1000 hogs**, or hog feeders, weigh 75 to 150 lbs. Address E. F. Sanguinetti, Yuma, Arizona.

**Greenwood Farm Durocs**—"Size with Quality." H. C. Witherow, Palo Cedro, Shasta County, Cal.

**Berkshires**—Sired by Star Leader, the \$1,500 boar, ready for service. Kounias Registered Stock Farms, Modesto.

**Durocs**—P. & L's Defender by Defender heads herd. Joseph Prendergast, Route 2 Box 87A, San Bernardino, Cal.

**Registered Durocs of the big type**—Cholera immune. Derryfield Farm, Odd Fellows Building, Sacramento, Cal.

**Carruthers' Farm Berkshire Hogs**—Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

**Poland-Chinas**—A few good breeding boars. S. F. Williams, Orland, Cal.

**TURKEYS**

**Just One Grand Champion Sweepstakes** Special offered for the best pair of turkeys in the show at the California State Fair, 1917, and that prize was won by GOLD NUGGET STRAIN GIANT BRONZE TURKEYS. They again proved their superiority by winning at three great shows, California State Fair, 1917, Texas State Fair, 1917, Los Angeles, 1918. Gold Special Sweepstakes at all three shows. Each judge pronounced them the best in the show, all breeds competing. Remember it was the Gold Nugget Strain that won at America's greatest turkey show, World's Fair, San Francisco. Three prizes on four entries. Large turkeys can be raised at practically the same cost as small ones. My toms will give you an increased weight of five pounds the first year. Either stock or eggs will give you vitality, size and beauty. Address all communications to J. Will Blackman, 607 East Third St., Los Angeles, Cal.

**Mammoth Bronze Eggs** our specialty. "Gold Nugget" and other strains of Mammoth type, also Collie Pups. John G. Mee, St. Helena, Cal.

**Three Bourbon Red Toms** eight dollars each. S. C. Rhode Island Red eggs, \$1.50 a setting. Mrs. G. F. Smith, Hardwick, Cal.

**Giant Bronze Turkeys and Eggs**—Choice breeding stock. M. M. Reiman, Planada, Cal.

**For Sale**—White Holland Turkeys. Fine breeding stock. \$5.00 each. 185 S. Aurora Ave., Watts.

**CATTLE**

**Guernseys**—We will sell stock from our prize winning, high producing herd, at reasonable prices, valued according to individuality and breeding. Our supply is limited but if the buyer wants a number of animals and will write us we will furnish him with particulars. Revada Guernsey Farm, Yountville, Napa Co., Cal.

**SHORTHORN CATTLE, SHROPSHIRE SHEEP, Berkshire Hogs and Shetland Ponies**. Get our prices and descriptions before buying. Butte City Ranch, Box C, Butte City, Glenn Co., Cal. W. P. Dwyer and W. S. Guilford, Owners.

**45 Hereford Bulls (Weaners)**—All purebred mountain raised, priced around \$125.00 head. Not blowed up with fat and air to sell them but in their everyday clothes. You won't be disappointed when you see them as they are as good as lots of people will ask around \$300 for. C. B. Johnson, Raymond.

**For Sale**—Registered Guernsey bull calves out of high producing cows and sired by splendid bull. Reasonable prices and terms. Use a Guernsey bull on your grade cows and secure heifers that will produce butterfat at real profit. Elm-dale Guernsey Farm, P. J. Weisel, Santa Fe Springs, Cal.

**Pedigreed Bull Calves**, Registered \$50.00, unregistered \$25.00. Service bulls \$75 and up. Good individuals from producers. Cows with yearly records at a profit, tuberculin tested. Write or come and select. Horses. N. H. Locke Co., Lockeford, Cal.

**Registered Holsteins** out of A.R.O. Dams. Grandsons of King Korndyke Henger-veld Ormsby who has 20 A.R.O. daughters with records of over 29 pounds. Look up this sire. Geo. Kounias, Modesto Farms, Modesto, Cal.

**D. O. Lively Stock Farm, Inc.**, 215 Hobart Bldg., San Francisco. Breeders of Hereford cattle. A few choice heifers for sale. We buy and sell live stock on commission. Farm at Mayfield.

**Veramont Stock Farm**—Pure Bred Herefords. Only 2 pure bred and 2 grade bulls left. One 11 month Hampshire ram. Prices right. H. M. Barngrover, San Jose.

**Am Offering Registered Holstein A. R. O.** cows and bulls of serviceable age. Write for particulars. J. W. Benoit, Route C, Modesto, Cal.

**ENGINES**

Several New and Slightly Used Engines, ARNOTT & CO., Implements, 112 S. Los Angeles St., Los Angeles.

**OAT AND PEA SILAGE**

The University of Wyoming has been making an investigation of silage for beef cows and growing cattle and has found that oats and peas planted together make an excellent combination. The report of these investigations does not exactly apply to California, but it may have some hints. The digest and resume of the experiments follows:

Oat and pea silage may be used to advantage in winter rations for beef cows.

Feeding tests with beef cows seem to indicate that oats and pea silage may be substituted for good alfalfa hay in about the proportion of two pounds of silage to one of hay.

In rations for growing cattle, the introduction of oat and pea silage greatly cheapens the cost of grains.

Silage, when used to replace part of the hay in rations for growing cattle, had a value far in excess of the four dollars per ton at which it was figured in cost estimates.

Even with a lower amount of digestible material in their rations, the cat-

tle getting silage made heavier gains. Oat and pea silage fed with alfalfa hay in rations for growing cattle was worth practically as much as the alfalfa.

**QUESTIONS AND ANSWERS**

Continued from Page 171

aged as any other banking business. The government makes a certain advance of funds to start the business and expects the people of the United States to purchase bonds of the federal bank with which the business may be maintained and money advanced to the farmers. Hence the one first duty of the management of the bank is to so manage the business that confidence will be established in these banks. This cannot be done unless the banks use great care in the risks taken. In order to determine what risks should be and what should not be taken an appraiser is appointed by the branch bank at Berkeley to investigate appraisement made by the local committee of each association. The decision of this appraiser is final. We believe the appraiser and the management are endeavoring to be absolutely just in rendering these decisions, but in making the decisions the only consideration is the actual agricultural value of the lands in question. Personality of the owner or his ability to make a success, even on poor lands with limited water, are not considered in the slightest degree. A 36 year loan is safe when made by a government bank to no greater degree than one made by a private bank. Hence the demand for intrinsic worth in the lands.

**Spray for Curl Leaf**

Have small orchard miscellaneous fruits for home use. Nearly all the peach trees, especially the Albertas, had curl leaf last year. What should I do to prevent this the coming summer?—Subscriber, Long Beach.

Spray with Bordeaux full strength, that is 5-5-50. Instructions for making have been given many times, especially in Spray Special, November 4, 1915. Be sure and do this before buds begin.

**Vines Dying**

Would it be advisable to spray my grape vines while dormant with Bordeaux mixture, since a few died during last summer, while others partly died and still others were not thrifty. Would you recommend some other treatment? Is so, what? They were pruned, fertilized with horse manure and also irrigated several times during last season.—Subscriber, National City.

Grape vines have a habit of just dying, and without knowing more it would be impossible to give cause of the trouble in this vineyard. All that can be done is to keep the soil in best condition, give proper pruning and watch for results. Of course it is presumed there is no phylloxera, but there is the mysterious Anaheim disease and other troubles which may come up in vineyards. Spraying with Bordeaux will aid in keeping down mildew and other fungus diseases.

**STATE DAIRY REPORT**

The report of the state dairy bureau shows a material lessening in the monthly receipts of butter at San Francisco last year from the receipts of 1915-16. The total for the year beginning October 1, 1915 was 27,877,700 pounds, while the total for the past year was 25,362,500 pounds. On the other hand, the price of butter for the year 1916-17 was nearly ten cents per pound above that of the preceding year. The production of various counties in the state likewise shows a decrease. The production for the year 1915-16 was 70,030,174 pounds, while for the year ending last October it was 68,373,021 pounds. Both the two big dairy counties, Stanislaus and Imperial, show material decrease. Stanislaus produced in 1915-16, 9,980,021 pounds and it dropped something over a cool million pounds the next year when she produced 8,935,964 pounds. Imperial showed a somewhat lesser decrease from 6,780,552 to 6,245,487 in the year ending last October. Fresno, Humboldt, Kings, Merced, San Luis Obispo, Sonoma all showed an increase. Kings showed the most pronounced increase from 3,960,949 in 1915-16 to 4,165,315 in year ending October, 1917.

NEW LIBERTY

## The New Liberty Brooder Stove

KRESKY'S done it again. It's GOOD BYE EXPENSIVE ENGINE DISTILLATE, COAL OIL and COAL. Your UNCLE SAMMIE needs you. Give your UNCLE SAMMIE, yourself and POCKET BOOK a chance. ## A Chance for the Chick

Written for California Cultivator By Jean A. Koethen

THIS one thing to start a brood of chicks right and quite another to keep them going after they are started.

One of the poultry books to which I pinned my faith years ago says: "The chick that is properly handled the first week of its life is practically half raised." This assertion must be taken with more than one grain of salt. A sentence which follows is so true, however, that every novice in poultry raising ought to write it in big letters and post in conspicuous places about the ranch: "The proper conditions may never be expected to exist with a lot of chickens that have been improperly handled the first week." Chicks that have been chilled or improperly fed the first four days are stunted from that time on. Some of those that have "pasted up behind" may live and for a time seem to make a normal growth, but sooner or later they begin to lag behind the rest, and if they live to maturity are nothing but runts.

The life of chicks divides itself naturally into three periods: The first five days, from the sixth day to the end of the third week; and from the end of the third to the end of the eighth week. After this time it is no longer a chick, but a chicken. During the first period warmth is the great essential. During the second period warmth and nourishment are of equal importance. The chick must take on considerable flesh, for it ought to double its weight the first month. If it falls behind now it never catches up. During the third period, rapid and symmetrical growth is the end aimed at. The feed is of immense importance, but the kind of feed is more important than the amount. More important even than the right kind of feed is the chance that must be given the chick to make the right use of the feed it gets.

I would like to call the essential of this second month's care a "chance" for the chick, for I am fully persuaded that more chicks die during this period than during those perilous first five days, and the reason for death is simply that they have no fair chance to live.

Four things are of prime importance during the second month: feed, cleanliness, room and exercise.

The chick, we must remember, is growing, and if he is to be a profitable investment, he must grow as rapidly as possible. He must also grow symmetrically. He cannot put on flesh till he has something to put it on, hence, bone making foods are of vital importance. He must also build muscle, for without muscle he cannot exercise and make the most of his food. Bone meal for strong bones, oats in various forms for both bone and muscle, bran and a variety of grains for flesh, green feed to keep the digestion in order, all are important at this period. There is nothing better for growing chicks than a liberal supply of oats. The pinhead oatmeal of the first week may be changed to bulk rolled oats the second week, and the bulk oats, when they are no longer fed alone or mixed with bread crumbs in the moist mash, may be mixed in the dry mash, with the bran and corn meal and middlings. Most chicks will eat sprouted oats before they are a month old, and these may be given freely. All chicks at this age ought to have cracked corn,

which is the best of fat makers, but this year many chicks will have to do without corn. I remember visiting one successful poultryman who fed his growing chicks practically nothing but beef scrap and a coarse grade of corn meal. As the chicks grew a coarser grade of meal was given.

During this time of rapid growth a moist mash, mixed, if possible, with sour milk, and fed once a day, is a great help. The chicks are always eager for it and whatever stimulates the appetite also stimulates growth. We want the chicks to eat all they can digest, and they will always eat more of the things they like best. Many chicks thrive and grow on a ration of dry mash and whole grain, but they will grow faster, other things being equal, with an occasional meal of moist mash.

A variety of hard grain should be given as soon as the chicks will eat it. From the third week on a little milo maize, Egyptian corn, cracked corn and whole wheat may be mixed with their chick feed. As they learn to eat it the proportion may be increased until the chick feed is omitted altogether. It is easy to keep chicks too long on the small grains. They need the larger grains, and these cannot be fed too soon.

Where one chick dies of indigestion during the second month, or is stunted because of improper food, a thousand die from the assaults of insect pests. When a chick five or six weeks old begins to look droopy, don't get out your poultry doctor. Clean out the coop. Never mind whether you see mites or not. Hose it out thoroughly, then paint with kerosene and crude carbolic acid, one part acid to four of kerosene. Don't do this once and leave it. Once the mites are there, the coop must be painted once a week, sometimes oftener if the weather is warm. There may be lice as well as mites. As a rule, we remember to dust hen and chicks when the hatch comes off but forget to repeat the dusting. By the end of a month the lice are on hand again. Few chicks are hardy enough to survive the constant teasing of lice or the blood-sucking of that worst of pests, the little red mite.

A month old chick occupies almost twice as much space in the brooder as a day old chick, yet how many amateur poultrymen expect the chicks to go on occupying the same quarters indefinitely. If half as many chicks are put in a brooder as it is supposed to hold, it will be two months before they fill it, but sooner or later they must have more room. Chicks with a hen are more fortunate. Unless the coop is far too small in the beginning they can continue to occupy it as long as the hen mothers them. After they are put in cold brooders, which is about the end of the second month, the same care must be exercised to prevent overcrowding that is necessary with brooder chicks.

Overcrowding and its corollary, lack of ventilation, are responsible for the stunting of many chicks. The very young chick needs warmth more than it needs air. As it grows fresh air becomes just as vital to its existence as food or warmth. The mother hen with her brood should be in an open front coop. If protection is necessary, the ever useful burlap sack may be hung in front for a curtain. The only way to find out whether a coop or brooder

## The Best Feed on the Market

Has the highest protein at the lowest price \$3.15 per 90-lb. bag, subject to market changes; see that your hens eat as much Dry Mash as they do grain; feed them lightly of grain in the morning and make them work for it; either have a scratching pen or spade up a part of the ground and rake the feed under; keep "A-1" Dry Mash in a dry form before them all day; about one hour before feeding them their grain in the evening WET their Mash and let them eat all they will; put it on top of the Dry Mash, then feed them all the grain they will eat; this stuffing process will give them a full crop to carry them through the long night of inactivity; analysis is printed on every bag; give it a trial. Electric, Hot Air and Hot Water. They are all good but the Electric is a World Beater, being a marvel of accuracy by self regulation. Can be attached to any electric wire of the ordinary voltage for house lighting purposes. Write for catalogue.

Harris Seed Co.

909 Sixth St. San Diego, Cal.

To keep thoroughly posted subscribers should read every advertisement in the California Cultivator columns.

is sufficiently ventilated is to put your head in. If the air is not such as you would care to sleep in be sure the hen and chicks do not like it any better. The heat of the hen's body is six or eight degrees higher than that of the human body. She can keep her chicks warm without help in the coldest weather.

Fewer chicks than usual will be raised this spring, so the few will have plenty of room to run. Making them scratch in deep litter or jump up to peck at a kale leaf is all right if you have nothing better to offer, but when there is all out-doors to run in, do let them run. Shut up the hen. She is the one that scratches up the garden. It will be a long time before the chicks do any damage, and they will not go far if she is confined. Exercise keeps the chicks growing and develops the egg organs of the pullets. A yard full of chicks sitting round in the sun waiting for something to happen is a sorry sight. Give the chicks a chance to grow and a chance to sleep and a chance to run. You may not raise so many but they will be better birds and less trouble.

#### HATCH EARLY

The department of agriculture is sending out a large hanger with photographs of early and late hatched pullets. These photos were taken in June, July, September and at maturity. On the hanger are such catch phrases as; "Have eggs when eggs are scarce," "Hatch early," "Early hatched pullets are winter layers," "Begin hatching February 1 in the South and March 1 in the North and West," "Complete hatching by May 1," "Chicks hatched early are stronger and have the advantage of a longer growing season," "Hot weather retards the growth of chicks, which, with presence of lice, causes millions of late hatched chicks to die early," "Produce fall and winter eggs."

#### STORRS EGG LAYING CONTEST

Storrs, Connecticut, January 25, 1918. Report for the twelfth week ending January 23, 1918.

Cold weather has continued so long that the hens in the laying contest seem to have acquired at least partial immunity. Nearly every pen is in fine condition; the birds have nice red combs; fresh litter has been put into the houses and the scratch grain has been feed oftener than usual during the past few weeks. In short the management has tried to keep the hens busy, because the busy hen is the happy and the productive hen. In the twelfth week the birds laid a total of 2086 eggs or 500 more than for the preceding week and while such rapid gains can not be expected each week, still it is believed that the egg production will continue to rise for the next three months.

The contest birds are not of course mated. They are pullets and would not be used for breeders. For those, however, who intend to hatch chicks the time has arrived when the birds should be mated. It is true that one can get fertile eggs within four or five days after the introduction of a male, but in general it isn't safe to wait until the last minute. It is better to mate the birds several weeks ahead of the time that the eggs are to be used for hatching.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Jules F. Francals, 326; Rock Rose Farm, 302; Rodman Schaff, 259.

#### White Wyandottes

Obed G. Knight, 392; Brayman Farm, 376; F. W. Harris, 320.

#### Rhode Island Reds

Pinecrest Orchards, 332; Richard Allen, 294; Allan's Hardtoeat Reds, 238.

#### White Leghorns

Braeside Poultry Farm, 331; J. O. LeFevre, 331; Hollywood Farm, 305.

#### Miscellaneous

Cook & Porter, (Buff Wyandottes), 382; Oregon Agricultural College (Oregons), 349; H. P. Cloyes, (Buff Wyandottes), 294.

#### TO ERADICATE POULTRY PARASITES

The first step to eradicate the pests which live in cracks and crevices in poultry houses is to thoroughly clean the house. All litter, nest material and droppings should be removed. Then spray or paint thoroughly the entire surface of the house and literally flood all cracks and inside of nests with a five per cent solution of cresol. Use plenty of spray and do the work thoroughly.

Finally it should be remembered that one application of either of these treatments is not sufficient. Where there are lice and mites there are also eggs or "nits" of these same pests. A second treatment should be given about one week after the first. By this time the "nits" will be hatched and the treatment will affect them while it did not kill the "nits" at the first application.

These suggestions followed out will relieve the hen of the greater number of parasites and will enable her to make the best possible use of her feed and time. It is not profitable to feed a hen when lice or mites are sapping all the nourishment and vitality from her body.—P. F. Schowengerdt, Colorado Agricultural College.

# TEST SPECIAL BELTING

A money-back-belt — no arguments — no quibbling

Why buy a belt once a year, or more often, when you can get a TEST SPECIAL?—It will save you time, annoyance of costly shut-downs, and increase the amount of power transmitted because there is no slippage.

A GOOD belt will last for many years—TEST SPECIAL surely will—money back if it doesn't.

No other belt has ever approached TEST SPECIAL in point of service—no other belt likely ever will—the reason—it is honestly made—most belts are "near belts."

Write to us about your belt troubles—make a rough diagram or drawing of your belt as now installed, if you can do so, otherwise, tell the story as fully as possible.

We'll promptly reply and tell you how to get the best results. You don't have to buy a TEST SPECIAL in order to get our help—you'll be sure to buy one some time, when you know how much money it will save you.

New York Belting and Packing Company

Home Office: New York City. Branches in all principal cities

#### FEED BUTTERMILK

Greatest returns are procured by feeding sour milk or buttermilk to both young and old birds.

Results in greater gains.

Will require less grain.

Produce more eggs.

Increase the profits.

Makes a home market for waste by-products.

#### GIVE POULTRY SHADE

Shade and range for chickens will give the best results.

Hot sun retards growth.

There should be trees, corn, sun-flowers, etc., on the range to provide shade during the hot summer months.

Chickens on range pick up much of their food.

LOS ANGELES

**Gas 'em!**

Kill off the  
whole crew of  
crop destroyers—  
squirrels, gophers,  
prairie dogs, etc.

Gas 'em with Carbon Bisulphide  
quick'y, easily and economically.

One burrow of squirrels will des-  
troy more grain than your family  
can save in fifty wheatless days.  
Remember—these ground pests cost  
the farmers of the Pacific Coast more  
than \$6,000,000 last summer. So be  
forehanded—be truly patriotic—con-  
serve the seed in your fields.

The University of California says: "From  
November until the end of February (the rainy  
season in California) the best way to attack  
the ground squirrels is to fill their burrows with  
gas from Carbon Bisulphide."

So too in other states! If the ground is full of  
moisture, whatever the month may be, Carbon  
Bisulphide is the best killer of squirrels,  
prairie dogs, gophers, etc.

A squirrel killed before March is worth a dozen  
killed later. Because—most young squirrels  
are born late in March or early in April. So—  
gas the old squirrels now. Write today for  
prices and interesting folder telling how Carbon  
Bisulphide—the profit-saver—works.

**WHEELER, REYNOLDS & STAUFFER**

626 California Street

**Use CARBON  
BISULPHIDE**

**USE THE WESTERN  
PULVERIZER, PACKER AND MULCHER**

for pre-  
paring your  
seed bed, will  
increase your crops  
25% whether you raise  
wheat, barley, sugar  
beets, beans, potatoes, al-  
falfa or any other crop. A par-  
fect, well pulverized and firm seed  
bed is an important factor for one crop as  
for another. The Western pulverizer and packs as  
deep as plowed and leaves a loose mulch on top to  
protect the moisture; saves 1-3 of expensive seed  
and time, labor and horse power in preparing a  
seed bed. It is especially adapted for breaking crust  
and cultivating winter wheat in the spring, or for  
breaking crust on sugar beets or beans either be-  
fore or after they are up without injury to the plants.

**MADE IN 12 SIZES, FOR HORSES OR TRACTOR**

## San Francisco Markets

San Francisco, Feb. 5, 1918.

### BUTTER

The quotations on butter are on the  
basis of solid packed cubes. To ascer-  
tain the market price of butter in  
squares, add to the cubes basis price per  
pound, as follows:

Two-pound squares, parchment wrap-  
per, ½c; 1-pound squares, parchment  
wrapped, 1c; 2-pound squares, in cartons,  
1½c to 2½c; 1-pound squares, in cartons,  
2c to 3c.

### RICE

California rice, new crop, cleaned, 100  
pound head rice, 6.45@6.65; brewers, 5.10;  
screenings, 5.37½.  
Rough rice, 100 lbs., 3.50@3.60 to grow-  
ers at shipping points.

### HAY

Under date of February 2, Scott, Mag-  
ner & Miller says:  
Receipts past week, 1167 tons. This  
large falling off in the receipts can only  
be accounted for by the fact that the  
government contracts are practically fill-  
ed and no more hay to speak of is arriv-  
ing for this purpose. The car situation  
has shown a little improvement with the  
result that the local market has been  
better stocked than for some time past.  
Trade throughout the city is extremely  
dull. No one is willing to stock up any  
more than his absolute requirements at  
the present high range of prices, figuring  
that should we have heavy rains a large  
part of the hay in farmers' barns will  
find its way to this market.  
Fancy Wheat Hay  
(light 5 wire bale) .....29.00@30.00  
No. 1 Wheat or Wheat and  
Oat Hay .....26.00@28.00

No. 1 Barley Straw .....60@90

### GRAIN

Grain Exchange prices, cwt.  
Corn, Cal. Yellow, cwt. ....3.25@3.50  
W. Egyptian .....3.40@3.50

Brown Egyptian .....3.20@3.25  
Barley, Feed and .....3.00@3.05  
Brewing, cwt. ....3.20@3.25  
Milo .....3.25@3.35  
Oats, Red Seed .....2.80@3.00  
Feed .....3.25@3.50  
New Black .....4.00@4.25  
Rye, Utah .....3.25@3.50  
Wheat — Government prices: Common  
white hard, base price is \$3.50 per central,  
or \$2.10 per bushel of 60 pounds delivered  
in terminal warehouses in bulk; soft  
wheat, base price 2 cents per bushel less,  
or \$2.08 per bushel; white club (including  
Sonora), \$2.06 per bushel. If wheat, after  
cleaning, weighs 60 pounds or more to  
bushel, base price stands; if 58 to 60  
pounds to bushel, 3 cents per bushel re-  
duction; if 56 to 58 pounds, 6 cents per  
bushel less; if less than 56 pounds, grain  
becomes sample grade and sells on its  
merits up to within 1 cent per bushel of  
56-lb. wheat. Sacked wheat 4 cents per  
bushel more, less tare for weight of  
sacks.

Rape .....2 1/2 @ 3

Citrus Fruit Market

Los Angeles, Feb. 6, 1918.

It is almost impossible to give any in-  
telligent view of market conditions dur-  
ing the past week because the cold  
weather and frozen fruits have been the  
principal factors. Many auction markets  
have not opened at all. Where sales  
have been made of fruit which has es-  
caped freezing in transit, good prices  
have obtained. Frozen stuff has sold at  
less than freight, on up, according to de-  
gree of injury. Long prices have ob-  
tained in a few cases with lemons and  
Navel oranges.

Shipments

Shipments of oranges from Southern  
California to date since November 1,  
1917: 3303 cars; lemons, 772; total, 4075.  
Last year to same date: Oranges, 5713  
cars; lemons, 1319; total 7032. From Cen-  
tral California this season: Oranges,  
1875; lemons, 98; total, 1973. Last year  
same date: Oranges, 3957; lemons, 141;  
total, 4098. From Northern California  
this season: Oranges, 202; last year, 842.

AT THE AUCTIONS

January 30

New York: 2 Lem. \$2.75-\$3.60.  
Boston: Nav. \$5.00-\$5.60.  
Pittsburg, 3 cars. Val. \$2.05-\$3.30;  
Lem. \$0.95-\$1.15.  
Cleveland: 2 cars. Nav. \$1.60-\$4.10.  
Lem. \$2.55-\$6.00.

January 31

New York: 1 Nav. \$4.10-\$5.15.  
No sale in other auction markets be-  
cause of traffic congestion and cold.

February 1

New York: No sale in New York, St.  
Louis and many other auction points.  
Cleveland: 1 Nav. \$5.70.  
Philadelphia: 1 Val. badly frozen, \$1.70-  
\$2.80.  
Boston: 1 Lem. \$2.35-\$2.75.

February 4

No sales at New York, Boston, Cincin-  
nati, Cleveland.  
St. Louis: 2 cars. Nav. \$3.50-\$4.40, Lem.  
\$5.05-\$6.20.  
Philadelphia: 1 car. Nav. \$2.75-\$3.95,  
Lem. \$3.15-\$3.35.

February 5

Weather very cold, no sales in many  
auctions. Only one reporting is Boston,  
3 cars received, Nav. \$2.80-\$5.20, Val.  
\$2.15-\$2.60.

MARKET NOTES

Apple prices have strengthened mater-  
ially.

Barley flour, now a regular food offer-  
ing in our market, is quoted at \$11 per  
barrel.

Rice growers are sitting tight and re-  
fusing to accept prices which have pre-  
vailed.

Potato prices will probably go no high-  
er this season, and it is feared that a  
slight decline may be shown.

4,000,000 pounds of Manchurian beans,  
consigned to various coast points from  
Los Angeles north, on wharves at Se-  
attle, were commandeered by the govern-  
ment. It is anticipated this will affect  
bean market favorably.

Post card reports to the bureau of  
markets of the United States depart-  
ment of agriculture show shipments from  
California during the week ending Feb-  
ruary 4, approximately as follows: Ap-  
ples, 3 cars; beets, 2; carrots, 3; cab-  
bage, 28; cauliflower, 94; celery, 122;  
dried beans, 37; dried apples, 3; dried ap-  
ricots, 6; dried figs, 1; dried fruit mixed,  
13; dried peaches, 27; dried prunes, 28;  
lettuce, 66; mixed vegetables, 44; mixed  
fresh fruit, 10; onions, 22; potatoes, 134;  
raisins, 67; turnips, 12.

Crop Specialist R. G. Risser of the  
United States department of agriculture  
reports marked improvement in condi-  
tion of growing cabbage. Frosty nights  
have checked aphid injury, and the light  
rains were beneficial. Lettuce crop in  
Imperial Valley reduced at least 40 per  
cent by cutworms, excessive irrigation,  
poor drainage and alkali. Peas bloom-  
ing profusely. Cauliflower and celery  
seriously injured by dryness. The in-  
jury from dry weather has been serious  
in all central and southern parts of the  
state; frost damage lighter than usual.

NEW SQUIRREL EXTERMINATOR

C. S. Wilkins informs us of a new dis-  
tillate vapor process of eradicating  
ground squirrels, which consists of a gen-  
erator which turns distillate into a heav-  
ier than air gas which under pressure is  
forced into the holes of the rodents. With  
this machine a gallon of distillate will  
run from five to ten hours.

MONTHLY WEATHER AND CROP  
REPORT

By E. A. Beale, San Francisco District  
Forecaster, United States Weather  
Bureau

More rain is badly needed in all parts  
of California except in the extreme  
northwest where the rainfall, although  
deficient, has fallen opportunely and in  
consequence has penetrated deeply into  
the soil, and vegetation is making satis-  
factory progress. One of the worst  
features about the rainfall deficiency is  
the small amount of snow in the moun-  
tains at the end of the month. At Sum-  
mit, where the Southern Pacific railway  
crosses the Sierra Nevada, elevation  
7017 feet, there were only two inches of  
snow on the ground at the end of Jan-  
uary, when the average amount at that  
season is 125 inches. Also at Camp  
Seven, near Hume, there were only a  
few inches,—last year there were 26 in-  
ches. It is the early snowfall, that set-  
tles and solidifies, that insures water,  
late in the season for irrigation and pow-  
er purposes. Therefore it is almost cer-  
tain there will be a shortage this year  
no matter how much snow falls in Feb-  
ruary and March.

The only rains of consequence occur-  
red in the northern portion of the state  
on the 12th, 13th and 14th, and in the  
southern portion on the 13th, 14th, 25th  
and 26th. Following the precipitation in  
the northern half of the state there were  
many days with desiccating north winds  
and a number of frosty nights, both of  
which operated to prevent germination  
of wheat, barley and oats, and also to re-  
tard the growth of that which previous-  
ly had come up to fair stands. In the  
southern half the rain on the 25th and  
26th did an immense amount of good in  
starting growth on the little land pre-  
viously seeded to grain and in permitting  
the plowing of more land for grain and  
early vegetables.

Although there were many frosty  
mornings the temperatures nowhere re-  
mained below the freezing point long  
enough to seriously injure citrus fruit,  
and very little smudging was necessary.  
In the San Joaquin and Salinas Valleys  
there is practically no feed on the ranges  
and cattle are suffering severely, espe-  
cially cows and calves, a number of  
which have died for want of feed. In  
other stock districts, except in the north-  
western counties, feed is short and the  
price of hay has become prohibitive, so  
that without enough rain in the near fu-  
ture to start a new growth of grass, loss  
of stock will increase rather than dimin-  
ish.

Some sugar beets and potatoes were  
planted during the month, and in the  
neighborhood of Brawley a large acre-  
age of cantaloupes has been planted.  
Horticulturists have been kept busy  
spraying and pruning deciduous fruit  
trees. In the vicinity of Azusa, Los An-  
geles County, the anomaly of a severe  
hailstorm occurred, which damaged  
young lemons and St. Michaels some-  
what, but no damage was apparently  
done to Navels and Valencia.

TRUE VIGILANCE

In a place in New Jersey a town  
building caught fire and the extin-  
guishers failed to do their work. A  
few days later at the town meeting  
some citizens tried to learn the reason.  
After they had freely discussed the  
subject, one of them said, "Mr. Chair-  
man, I make a motion that the fire  
extinguishers be examined ten days  
before every fire."—Philadelphia Pub-  
lic Ledger.

When you finish reading an inter-  
esting magazine, put a one cent stamp  
on cover and drop in nearest post box.  
It will be delivered by the United  
States to our soldiers "Over There."  
No address is necessary; merely the  
stamp.

TWENTY-FIFTH ANNUAL

Aggeler & Musser Seed Co. of Los An-  
geles is mailing its twenty-fifth annual  
catalogue, or what it terms its School  
Garden Number. This title, we doubt  
not, has been given because of the great  
interest shown in every city and town of  
the country in school and back yard gar-  
dens, and well has this done its work of  
preparing a fund of information which  
will aid in this school garden work.

The cover illustration is a magnificent  
one of the East Whittier School which  
last year won a \$600 prize for its attrac-  
tive grounds.

## Honey Production and Markets

VIEWING Eastern honey market condition a writer in "The Domestic Beekeeper" says:

The season of 1917 will long be remembered as having been one of the latest springs on record. Apple trees in this section (Vermont) did not bloom until June. The first white clover bloom that I saw was on the 18th of June. Bees did not gather surplus from that source to any extent until July 1. In an average season we expect clover to yield nectar freely by the middle of June. There was in this section a profusion of clover bloom and bees stored honey freely until the last week in July when the excessive hot dry weather cut into the yield, drying up the clover and giving us a short season and only a moderate crop of honey.

It is interesting to look back over the past 50 years and note the changes that have come over our honey pasturage. Then almost our only sources were white clover and basswood. Then if one failed the other could usually be depended upon, but when both failed most of the bees died, as was the case in 1860. Now basswood has gone, but we are averaging as good crops of honey as in the long ago. Alsike clover has come in so freely in meadows and roadsides that it makes up quite well for the loss of the linden, and is much more certain

than the white clover. Dandelions too have spread wonderfully in recent years and have become an important source of nectar. Last spring strong colonies gathered in this vicinity an average of ten pounds above what was used in the rearing of brood. The honey is a light amber and when well ripened of fair quality. It is liable to granulate quickly and when carried above into supers is liable to make trouble. Notwithstanding, we esteem it a very decided help in building up our bees, as it comes in at a time when there is little else to be had, fruit bloom giving us in average seasons but little nectar. It thrives best in a heavy soil and our cold springs in Northern New England seem to suit it so well that it spreads a feast of pollen and nectar for every passing insect.

The year 1917 will be long remembered as the year in which there has been a large advance in the price of honey. Extracted honey has advanced 50 per cent or better and comb honey has increased from ten to 20 per cent. The large foreign demand accounts in part for the large advance of extracted honey, but not wholly I think. The increasing demand for choice honey for bottling has had its effect in boosting the price. Another factor we are apt to overlook is what might be called the depreciation of money. So much money has been coming to this country during the last two or three years, and is still coming that we might almost say that money has become so abundant that it is cheap and requires more to buy any given commodity whether it is butter, eggs, potatoes or honey. Between 1850 and 1860 the price of honey so far as I remember was 12 cents a pound and comb honey at that. We had no extracted honey then. During the Civil war so much money was paid out by the government and money was so much more plentiful than necessities that prices bounded up much as they have of late. Wheat sold for \$3.00 a bushel and I remember a tub of butter paying 56 cents a pound for it. Honey that was so cheap earlier went up to 30 cents a pound and from 1867 to 1880 the average price was above 30 cents.

### CORRESPONDENCE COURSES IN AGRICULTURE

The University of California now has ready for distribution Circular 113, "Correspondence Courses in Agriculture," showing that instruction will be given in nearly 30 branches of agriculture. To mention a few: Culture of alfalfa, corn, figs, barley, dairy, swine, sheep, pears, plums, walnuts, lemons. If interested write to College of Agriculture, Berkeley, for information.

### Book Review

#### THIS YEAR'S GARDEN

Professor J. W. Lloyd of the University of Illinois, and who recently spent a year in California gathering fund of information on cooperation, is author of "Shall I Plant a Garden This Year?" His answer is affirmative. He says:

The logical thing for a prospective gardener to do is to make a definite decision to give his garden consistent care throughout the whole season and then to let nothing move him from that determination. In order to give his garden proper care he must know what to plant in his particular locality and when to plant it. He must know which varieties will best meet his needs. He must know what insects and diseases to expect and how to combat them. The more he can learn about each of the crops he proposes to grow before he attempts to grow it, the better prepared for the season's tasks he will be.

A definite plan of the proposed garden should be made on paper. This plan should indicate the location of each kind of vegetable in the garden, the distance between the rows, and the approximate time of planting each crop. Since a home garden is a personal matter, the plans made by different individuals will reflect their particular tastes. However, in all garden plans, it is desirable that an arrangement of the crops be employed which will make the best possible use of the available space and at the same time minimize labor in preparation and care. Suggested plans are given in the book. Plans for gardens of various sizes are also given in Circular 198 of this station.

#### BEAN SPROUTS

We are continually getting acquainted with new vegetables and new varieties of old-time favorites. Now comes the bean sprout. The Japs are teaching us to eat them and we have endeavored to learn as to production. The Jap market people shrug their shoulders and seem to "no sabe," but we understand the process of sprouting is similar to that of seed testing, i. e., beans are placed on moist blanket and covered with another, so as to maintain an even growing condition with plenty of warmth. The sprouts come out an inch or two long and presumably are largely water; also have little or no food value. They are, however, very delicious and make a nice salad, are very good creamed or fried and served hot after baking.

As a producing proposition we think Americans will hardly enter the field for they are sold two pounds for 15 cents.

#### INTERNATIONAL YEAR BOOK

The International Year Book of agricultural statistics, 1907-1916, is now issued by the International Society of Agriculture with headquarters at Rome, Italy. Within its thousand pages it supplies to all who wish to have them at hand, not only a complete summary, but all the detailed statistics, of agricultural operations throughout the world.

This institute is the result of the efforts of a Californian, David Lubin, and its efforts to secure information as to the world's production of foods have been of inestimable value, especially so during the period since the war.

The price of the volume is \$2.00. It will be promptly forwarded post free on receipt of request, accompanied by postal card, to the Service de abonnements et publications de l'Institut International d'Agriculture, Villa Umberto, Rome, Italy.

### SAINT VALENTINE KING

I am king just one month of the year  
And the shortest one too, I confess,  
But the deeds that I do  
Are not feeble nor few,  
For to hearts my appeals I address.

My castle I keep full of hearts  
And Cupid comes flying around  
To capture at will,  
And his quiver to fill,  
With arrows strewn thickly around.

My post office too, is well stored,  
Such a long list no other can show:  
So from "A" to "Z,"  
All the children may see  
That each name I familiarly know.

Then be ready, my little ones all,  
For the message that Cupid will bring:  
For he'll soon be about,  
So, with laugh and with shout,  
All shall hail good Saint Valentine King!  
—Harriet Adams Sawyer.

### MY VALENTINES

Written for California Cultivator  
By Vena B. Wales

**O**NCE upon a time, in the sweet-remembered long ago, I received a valentine—the first one that had ever come to me.

How well I recall the blustering February evening and the picture of my Father, just returned from the weekly visit to the postoffice, as he shook the snow from cap and muffler and coat in front of the great fireplace, finally dealing out the letters to each expectant one. The last envelope, square, and larger than any of the others, came to me with Father's hearty "Here, Puss, a big one for you!"

With bulging eyes I opened it while all the family watched. I thought I had never seen anything so beautiful as the lace edged square with the boy and girl, hand in hand, by a clever contrivance of folded cardboard, standing out from highly colored roses of red and yellow. It was quite some time before I discovered that it opened and that inside was a verse. And there were some initials underneath the verse too, three of them—"J. C. B."

Mother bade me read the verse aloud, and so with blushes and hesitation I read:

If you love me as I love you,  
No knife can cut our love in two.

They all laughed, but Father patted me with his big, loving hand and said it was a pretty valentine and a pretty verse and that I should put it away and keep it.

I did put it away and I have it yet, though all this happened, you know, in the sweet-remembered long ago.

But the other morning among my daily grist of some dozen boresome letters came a square white envelope addressed in a hand that attracted my attention, a writing that signified either extreme youth or extreme age. I opened the envelope in that blaze

way we have taken on in these days of many letters, and—there it was! almost a duplicate of that other valentine, except that the lace edge was more exquisite in design and the coloring of the hand-in-hand boy and girl and roses was more delicate. I turned to the verse and initials with trembling fingers and tender memories. Yes, there was a verse and initials too, and with misty eyes I read:

"If you love me as I love you,  
No knife can cut our love in two."  
—J. C. B.

Again I looked at the writing on the envelope—of course—queer I hadn't known it at once—the scrawl of my young grandson, named for his grandfather and so like him! Again I thought I had never seen anything so beautiful as that bit of paper and silly verse.

Then I went to my treasure chest and got out the old valentine, yellowed and faded from being "put away" for a third of a century. I penned something on its discolored leaf below the couplet and initials, and I penned something on the pristine whiteness of the new one, then carefully and lovingly I put each back in its own envelope, tying them together with the same faded blue ribbon that had been for so many years about my first valentine.

I had added to my treasures of the sweet-remembered long ago one of today.

### SANDWICH RECIPES FROM CULTIVATOR READERS

Mrs. Guy Halley, Lindsay

Mix one tablespoon of thick sweet cream with one tablespoon peanut butter until thick and creamy. Add a dash of salt to taste and spread on thin slices of white bread. Dot with small seedless raisins and press slices together in pairs. Cut in triangles.

Another delicious sandwich is made with rye bread. To one-half cup finely minced olives add one tablespoon grated cheese and one tablespoon finely minced pimiento. Mix well and spread on thin slices of rye bread which have been lightly buttered. By the way, if butter is thoroughly creamed before spreading on sandwiches it goes much farther and tastes better.

Mrs. E. A. Frey, Exeter

Nuts and dried fruits, preferably raisins, figs, prunes or dates, ground to a paste, moistened with fruit juice, water or cream and spread between thin slices of buttered white or brown bread make a very appetizing sandwich.

Cheese ground and mixed with cream, to which a very little salt and pepper has been added, makes a moist sandwich and a good substitute for meat sandwiches.

Mrs. J. B. McCormick, Lindsay

Put sweet green peppers through a meat grinder, add equal amount of hard boiled egg and use between white or dark bread.

Another: Blanch one-half cup almonds and toast to light brown in oven or over flame, seed one cup olives, put both through meat grinder and mix with small amount of lemon juice and salt and use with either white or dark bread.

Mrs. E. A. Cook, Winters

I make a nut bread as follows: One and one-half cups white flour, one-half cup corn meal, two cups graham flour, or one cup graham flour and one cup rye meal, one-half cup brown sugar, one-half cup syrup, one cup walnut meats broken up but not too fine, a little salt, one level teaspoon soda,

## "Refreshments will be served"

IT makes little difference whether it's a dance, a school or church social, a Red Cross Chapter meeting, a "get-together" meeting of the Farm Bureau or a big rally—

Chances are Ghirardelli's will be "among those present." And—for very good reason:

It promotes sociability. It provides added cheer and comfort. It is a delicious, refreshing food-beverage that is always in order at *any* social function.

In  $\frac{1}{2}$  lb., 1 lb. and 3 lb. cans; a  
tablespoonful—one cent's worth—  
makes a cup.

## In The Nation's Service

America is sending its best men to fight for freedom and in their honor the whole land is dotted with service flags carrying the stars of sacrifice.

It is a far cry from the crowded city streets above which floats our service flag to the telephone exchange hidden in the front-line trenches. But the actuating spirit of service here and abroad remains unchanged.

The Stars and Stripes is the emblem which unites us

in war for human liberty and national honor. The service flag is the emblem which unites us in mutual sympathy for the men who give themselves and for those who give their men.

These flags should inspire all citizens to greater endeavor and greater sacrifice. As one of the agencies of preparation and military support, the Bell System is honored by the opportunity to do its share.

coming to farmers from the rich wheat fields of Western Canada. Where you can buy good farm land at \$15. to \$30. per acre and raise from 20 to 45 bushels of \$2. wheat to the acre it's easy to make money. Canada offers in her provinces of Manitoba, Saskatchewan and Alberta

### 160 Acre Homesteads Free to Settlers

and other land at very low prices. Thousands of farmers from the U.S. or their sons are yearly taking advantage of this great opportunity. Wonderful yields also of Oats, Barley and Flax. Mixed Farming is fully as profitable an industry as grain raising. Good schools, markets convenient, climate excellent. Write for literature and particulars as to reduced railway rates to Supt. Immigration, Ottawa, Canada, or to

**GILBERT ROCHE**

3-5 First St., Sheldon Block  
San Francisco, Cal.

Canadian Government Agent.

two level teaspoons baking powder. Sift soda and baking powder with white flour, mix all dry ingredients, then mix in syrup and about one pint of sour milk (butter milk preferred). Have dough soft but not runny. Put this in slender pans and bake for about 45 minutes. Have oven hot enough to brown it richly but be careful of burning it. When cold slice thin and butter. Or if you want a rich sandwich take equal amounts of English walnuts and black dried figs. Put through meat grinder three times, using a coarse knife plate the first time and finer one the second and third times. This mixes the nuts and figs nicely. Then work it into a loaf about the shape of your bread and when it sets a few hours you can slice right through it with a sharp knife; and this without any butter makes delicious sandwiches. Add a pinch of salt. Most of us Californians have walnuts and figs, so these are not expensive.

### WHAT THE UNITED STATES PAYS THE SOLDIER AND HIS FAMILY

Authorized Statement of Our Government in the Official Bulletin

PAYMENTS are now being made from the \$176,150,000 "war risk" appropriation which the government has provided for the protection of the fighting forces and their dependents.

This fund was authorized under the military and naval insurance act, approved by the president on October 6, and it is designed to free American soldiers and sailors from the fear that their families may be deprived of life necessities or that they may become helpless charges through physical disability incurred by war service.

It must be understood that this feature of compensation is entirely in addition to the funds paid out monthly by the government in the form of wages to its protectors.

#### Administered by Special Bureau

The military and naval insurance system is administered by the war risk insurance bureau, under the direction of the secretary of the treasury, and Mr. McAdoo has characterized it as "the greatest measure of protection ever offered by any nation to its fighting forces."

Three separate and distinct elements of protection are offered: (1) Family allowances for the support, during the war, of enlisted men's families; (2) stated compensation for partial and total disability or death caused in the line of duty; (3) government insurance against death and total disability.

The work of administering the war risk insurance feature of compensation requires the services of some 1,500 government employees and, due to the tremendous amount of administrative detail involved, there was a delay in making actual payments, but at the present time more than 200,000 checks have actually been mailed as allowances. Only a small number of payments have so far been made on claims for compensation for disability or death or on account of insurance and these claims are not numerous.

#### The Plan in Detail

Just what the war risk plan of compensation means to the fighting forces and their dependents is comprehended in the following statement authorized by the secretary of the treasury:

(1) Allowances and Allotments: All enlisted men, according to the law, must contribute not more than 50 per cent of their pay for the support of their immediate families. On application the government will add to this allotment an allowance of its own of from \$5.00 to \$50 a month, according to the size of the family. The system, briefly, works out as follows:

The amount that the government gives to an enlisted man's immediate family is fixed by law, \$15 for a wife, \$25 for a wife and one child, \$32.50 for a wife and two children (all on a monthly basis), and \$5 additional for each additional child.

The enlisted man must contribute, that is, have deducted from his pay, or "allotted," an amount equal to the government allowance, but the minimum for an enlisted man's allotment is \$15 a month and the maximum is half his pay.

By this plan the government and

## The Cultivator Patterns

8159—Ladies' Waist. Cut in sizes 36 to 42 inches bust measure. The waist is made with a vest and long, or short sleeves.

8174—Girl's Dress. Cut in sizes 6 to 11 years. The dress closes at the front and yokes and panel are in one.

8145—Ladies' Dress. Cut in sizes 36 to 42 inches bust measure. The dress is cut in one piece, closes at the front and may have long or short sleeves.

7882—Ladies' Shirt Waist. Cut in sizes 36 to 42 inches bust measure. Linen, madras, crepe de Chine or satin can be used to make this waist.

8145—Children's Romper Dress. Cut in sizes 1, 2, 4 and 6 years. The dress closes at the back and the bloomer section is attached to lower edge of dress.

8179—Ladies' Skirt. Cut in sizes 24 to 34 inches waist measure. The skirt is cut in four gores and has a box plait at each side of the front and back.

8183—Ladies' Dress. Cut in sizes 36 to 44 inches bust measure. The dress closes at the front and has a three-gored gathered skirt in regulation waistline.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

#### HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

Pattern Department  
California Cultivator  
Los Angeles

the enlisted man are partners on a half and half basis, and both together assure the mans' family adequate support while he is fighting for his country.

If the enlisted man will make some further allotment for a dependent parent, brother, sister or grandchild, they may receive additional allowances from the government. Here again the government and the soldiers are partners, in a way that is not only just but democratic.

Nurses and commissioned officers are not included in the provision for allotments and allowances.

The maximum amount which the government will contribute to any dependent is the same for the highest noncommissioned officer as for the lowest grade of private.

**Rates of Compensation**

(2) Compensation: If any enlisted man or an officer, or an army or navy nurse, should be disabled by injuries or disease contracted in the line of duty, the government will pay him, without any expense on his part, fixed compensation of from \$30 to \$100 a month, or, if he should die, the government will pay his wife, child or his widowed mother fixed compensation of from \$20 to \$75 a month. The amount of compensation for this total disability will depend, within the prescribed limits, on the number of dependents left. To an injured person who is totally disabled and in addition so helpless as to be in constant need of a nurse or attendant, such additional sum shall be paid, but not exceeding \$20 a month, as may be deemed advisable.

Stated compensation will also be paid in cases of partial disability. The amount will be a percentage of the compensation for total disability, depending on the reduction in earning capacity resulting from the injury.

In paying this stated compensation for partial and total disability and for death the government draws no distinction between officers and enlisted men. The compensation is not based on the pay of the man.

Thus the widow, with no child, of a colonel or major general killed in action will receive the same compensation as the widow, with no child, of a second lieutenant or private killed in action, namely, \$25 a month, paid until death or remarriage.

**The Insurance Provision**

(3) Insurance: In addition to family allowances, in addition to compensation for disability and death, furnished by the government without charge, the law provides that all soldiers, sailors, marines or nurses, commissioned, enlisted or drafted, may buy from the government insurance against death and total disability. This insurance is sold at the normal peace rate, and even lower than the normal peace rate of private companies, for the government does not have to pay for medical examinations, commissions and other important items. The government assumes the extra hazard caused by war service as its plain duty and obligation.

The government takes away a fighter's insurability by calling him into the most hazardous business in the world, war, and in return the government goes into the insurance business for his benefit.

The insurance lasts for 20 years and is paid in 140 monthly installments—\$5.75 for each \$1,000 of insurance. But if the man taking out the insurance is still alive and totally and permanently disabled after the expiration of the 20 year term the payments will continue until he dies. Furthermore, five years after the war the insurance may be converted into the numerous kinds of insurance sold by private companies.

**Maximum Amount \$10,000**

The maximum amount of insurance which the government will issue to any one person is \$10,000. The cost ranges from 65 cents monthly at the age of 21 to \$1.20 monthly at the age of 51 for each \$1,000 of insurance. The maximum of \$10,000 is respected regardless of rank or pay. For a person 25 years old the \$10,000 insurance would cost only \$6.60 a month, thus bringing the maximum policy within the grasp of all soldiers and sailors even of the lowest ranks. The premiums may be deducted from a man's pay, if he desires, thus saving him the trouble of making payments.

# An Investment in Efficiency

CERTAINLY the farmer's need for a substantial motor car has never been so great as it is now. The larger part he plays in national affairs, the increased demands upon his time and knowledge, alike require for him a better means of transportation. Progressive farmers in all parts of the country are awake to this need and in thousands of instances are wisely meeting it with an Oakland Sensible Six. In choosing such a car they insure themselves the highest type of service at the minimum of upkeep cost, and their purchase becomes a real investment in efficiency. The high-speed overhead-valve engine of the Oakland Sensible Six is immensely

powerful and economical; it delivers 44 horsepower at 2600 r. p. m., or one horsepower to every 48 pounds of car weight. The finely-made chassis is extraordinarily strong and serviceable, and the slightly body is swung on long springs over a generous wheelbase, insuring full comfort. The car as a whole is handsome in proportion and finish; it is unusually roomy and accessible, and is upholstered with genuine leather throughout. As a perfected example of scientific light-weight construction, high power and fixed economy, its value is not equaled in the present car market.

OAKLAND MOTOR CAR CO.

### Horse-Pace Family!—You Have Come to the Turning Point

Business-Farmer—to be longer without a motor car may affect the whole of your success, and the whole of your family's future.

Have you noticed lately that somehow the good chances that are missed by you are seized by others—others who have automobiles?

Have you noticed that, though some men you know of turn every hour and minute into profit, *your* work goes slow, *your* time is spent in fretting against delays—and that you are getting into the habit of letting many a good chance pass because you "wouldn't be able to get there in time?"

\* \* \*

Have you noticed that your family—your girls, your boys, your wife—are steadily, steadily getting out of touch with those they ought to know? Have you realized that the families which surround you—automobile families—have a circle of friends and interests, and a radius of easy visits, far larger than your family? Open your eyes.

Have you noticed how many times you and your family have been placed under obligation by

neighbors who have cars? Aren't you tired of asking favors?

\* \* \*

Your environment is moving at automobile pace. You and your family are limited to horse-pace and horse-radius. And in the next few months the paths of automobile families and horse-pace families will separate still more sharply. Only motor-pace will do for the conditions in which this nation is now doing its work.

You stand at the turning point.

\* \* \*

Motor-car service now costs less than horse service for all the work that a motor car can do.

And of all motor cars of equal service the one that costs least to run and least to own is the Maxwell.

Investigate this while these cars of greatest efficiency are still procurable. Write us a letter today.

*Touring Car \$745; Roadster \$745; Touring Car with Winter Top \$855  
Roadster with Winter Top \$830; Berline \$1095; Sedan with Wire Wheels \$1195. F.O.B. Detroit*

One Dollar Yearly

## Water Conservation Essential This Year

Bone Dry Condition of Soil and Subsoil Calls for Saving Every Drop. Irrigation Beginning in All Sections of the State. Much Valuable Moisture May be Saved by Mulching and Shallow Cultivation

THEODORE ROOSEVELT has said: "The forest and water problems are perhaps the most vital international problems of the United States."

This is certainly true with double force this year of all years when we are appealed to to produce more. It is a question of most vital importance from an

international as well as internal standpoint, and to this demand for increase all the country, and especially California, responded last year most patriotically. She will respond equally this year so far as patriotism is concerned, but from the present outlook nature is not joining in the effort. Hence, how man can overcome these difficulties which confront producers, is a question of most vital importance.

Producers of the state are situated so as to take advantage of natural conditions as never before, but there are still undeveloped resources which we must make use of so far as possible. Perhaps one of our greatest losses in the past has been caused by abundance of water and lack of equipment for handling with greatest economy. There are still streams wasting to the sea; there are gravel beds underneath the earth's surface filled with water. How may these resources be used? There will be many wells driven; there will be diversion dams; there will be repairs of canals and ditches; some sandy or gravelly strips will be cemented or flumed to make less loss.

As a bit of help the Cultivator gives in another column lists of various publications on irrigation, reference to which will be of value to the irrigator. But, directly, we may gather a few hints and pass on.

Our streams are the most economical source of irrigation water, when the water can be taken out and carried by gravity to the lands where it

present need, the expense would be justified in many instances where it would not have been under normal conditions. Beside concreting and fluming there is the prevention of seepage by the use of oil. This we

the reservoir should be made across a depression. In that case it will be necessary to puddle the filling as it is put in, so as to make the side firm and strong enough to withstand the pressure. The method of working the oil into the sides will depend somewhat on the size of the reservoir. If the reservoir is small the work will need to be done by hand with a hoe and rake, but on large reservoirs it can be done with horses and harrows."

But of greater value perhaps so late in the season may be a few hints to the individual irrigator. The most economical use of irrigation water is by subirrigation, or applying water in perforated pipes several inches or a few feet under the soil. This plan of irrigation has been followed successfully in the case of small gardens, but with trees, or extensively used, it has not proven satisfactory, especially after a period of years.

Overhead irrigation has proven expensive to install, and while it has been tried in California for many years, so far as we know, the earlier installed plants have been entirely removed.

Field Ready for Alfalfa  
Dirt ditches with wood gates and well leveled and ridged "checks" or "lands" or "baisins."

have referred to several times in the Cultivator. Sometime ago Mr. Neff gave information as to making reservoir on the natural soil by use of oil worked into the sides and bottom of the reservoir. This applies with equal force to canals. Mr. Neff said:

"A fairly satisfactory reservoir can be made on sandy loam. The slope of the sides should not be very steep; a rise of one foot in four will be better than a greater rise as it gives a better chance to work in the oil. If clay or silt can be had without too long haul it will pay to cover the bottom and sides with this and work it in with the oil. Use the heaviest road oil to be had and about three gallons to the square yard. Either have the oil heated or put on when the weather is hot, and work the oil into the bottom and sides to a depth of two and a half or three inches. It is not necessary to tamp sides or bottom after the oil has been worked in, as the tramping of the teams in making the sides will be sufficient for the foundation, unless

There are two forms of surface irrigation generally practiced; the furrow system, usually with straight furrows between rows of trees, or some-

times zigzag in order to fill all the land with water, then there is the check, or basin, system. Both forms are used in orchard and general farm practice. As a rule, the orchardist prefers the straight furrow, water running in exceeding small streams and for several hours, the period of flow depending upon the nature of the soil. The basin, or check, system is generally used in all field crops and by but few orchardists. Little economies in the handling of water under either of these systems are suggested more by the engravings than by extended description.

But more than all, at this particular time it is of value that every available drop of water in California during these winter months when there is little demand for it, should be put upon, or rather into, our soils, and if this is done there is use for cultivators, rollers and every type of surface soil worker to keep this moisture for the summer's use. All green manure or weed crops should be turned under and the draft upon the soil stopped. The surface mulch of dust or straw or any substance which may be secured should be used to the utmost.

In windmill or small power plant supply storage is necessary to make economical or satisfactory irrigation. This storage may be in the steel or wooden tank, or in the concrete or earth reservoir where conditions are favorable. Every problem has to be solved with consideration of all the conditions on the ranch, and these conditions have to do with the nature of the soil in which the reservoir is made, the subsoil underneath and many other factors.

With California sunshine to deal with it is wise to make the area of the reservoir as small as possible to prevent seepage. The suggestion given above by Mr. Neff as to surfacing with crude oil is a good one where

Redwood Makes a Fine Flume

With modern metal gates and a well constructed flume "pitched within and without" with crude oil rich in asphaltum, one man can more satisfactorily control a big "head" than can two with dirt ditch.

conditions are right, and we know of cases where even gravelly soil with very porous subsoil has been made to hold water by the use of a very heavy oil, or even by puddling with clay hauled to the reservoir and tamped by corralling sheep within the depression before the admission of water. With present day prices of cement, where gravel and sand are within reach, the concrete lining is the most satisfactory. Where this concrete is placed upon dry sides care must be exercised to have the sides well settled and tamped before applying the concrete.

Another source of water supply, far more expensive but possessing many advantages, and the use of which has increased much during the past ten years, is the pumping of water from wells. There are yet a few flowing wells in California, but owing to the increased demand upon the lower strata their number has greatly decreased. But, owing to the enterprise

"A" Crowder

With sheet iron "nose" wagon tire guard or runner will last years. Works new ditches and cleans old.

of pumping machinery manufacturers, the lifting of great quantities of water for irrigation has been simplified and methods perfected until there are cases in California where as much as a 400 foot lift has been made and still fairly economical production of crops. In general, however, any such lift is prohibitive. There are many sections in all portions of the state not yet fully developed which have possibilities for developing deep wells.

### Irrigation Publications

Perhaps one of the very best books on irrigation is Irrigation in the United States, by Frederick Haynes Newell, published by Crowell, New York.

Another good book is Irrigation and Drainage, by F. H. King, Macmillans, New York.

Primer of Irrigation, by D. H. Anderson, editor of Irrigation Age, Chicago.

American Irrigation Farming, by W. H. Owens, published by A. D. McClure Company, Chicago.

The metal dam or tapoon.

### Tapoon

Ordinarily the tapoon is a semi-circular piece of steel, say three or four feet on the straight edge, screwed or bolted to handle of wood and used to dam or divert water from temporary ditch. Supplied with sliding gate as in one illustrated above the tapoon becomes a "division box," and a desired amount may be allowed to continue down the ditch.

#### FIG GROWERS COOPERATING

Since the recent fig growers' convention at Fresno things having to do with the fig industry have moved. More than 200 fig growers have decided to cooperate in marketing their product and permanent offices of the association have been taken in the Cory Building, Fresno. Prices for next year have been named as follows:

Calimyrnas	15 cents
Adriatics and Kadotas	10 cents
Black Missions	8 cents
Calimyrna Splits	6 cents
Calimyrna Culls	5 cents
Adriatic Culls	4 cents

Secretary Newby says:

#### Union Means Success

"By reason of the organization the buyers have been spurred on to offer a much higher price than formerly. This clearly shows the effect and the wisdom of organization. It shows that in union there is strength."

**GET BUSY**

"America's Most Useful Farm Implement"

## Enlist Your Ford Your Country Needs It

Increased food production is the crying need of the country. More corn, wheat, oats, rye barley—more land under cultivation—more productive labor from horses, machinery and the men on the farms. Efficiency and greater output are not only patriotic duties, but they insure increased profits. And the

# STAUDE Mak-a-Tractor

(Trademark Mak-a-Tractor Reg. U. S. Pat. Office and Principal Foreign Countries)  
Price \$225 F. O. B. St. Paul

stands today as the farmers first and strongest ally in the battle for food supremacy. **Put that Ford to work.** Remember you have two-thirds of a tractor already in your car. A Staude completes the job and does double the work. It releases 20 acres for food for men that otherwise go to feed that four-horse team.

## Making Good With 7,000 Farmers

The triumph of the Staude Mak-a-Tractor has been so tremendous that any possible doubts of its efficiency have been swept away by the tidal wave of popular approval. The enthusiastic praise from users everywhere is the most convincing evidence that it has more than justified every prediction made for it. Thousands of farmers can testify that the Staude has stood up well under the most grueling test in all kinds of farm work and heavy hauling.

## More Work—Less Cost

It does continuously—24 hours a day if necessary—the work of four horses at the cost of feeding one. It plows an acre with less than two gallons of gasoline—is easy to attach and operate—can be used on Fords, Overlands, Chevrolets and other cars—is detached in 20 minutes, permitting the use of your car on the road—nothing to get out of order or require adjustment.

## Master of All the Farm Work

Attached in a few minutes to your automobile, the Staude Mak-a-Tractor will do your plowing, seeding, reaping, binding and hauling. Equipped with the Belt Power Attachment, it does your sawing, grinding, shelling, feed chopping, pumping and any other work that an 8-10 H. P. farm engine could do.

We are co-operating with the U. S. Government in the increased food production through greater acreage and increased yield per acre. The Staude Mak-a-Tractor will help you solve these problems.

I plowed 180 acres with my Staude at a cost of less than 50 cents an acre. My car is just as good as ever and the engine don't heat. I used about one quart of water a day. I plowed 6 acres a day, where I could only plow 6 acres with 5 horses on the gang. It does the work of six horses and not four.  
J. S. Welter, Grafton, N. D.

I cut all my wheat, 450 acres, with a Staude Mak-a-Tractor and am plowing 10 acres a day at the present time with a 14 inch gang, and don't have any trouble with it bending and it doesn't damage the car as much as running on the road.  
A. Christopherson, Flaxville, Mont.

My Staude Mak-a-Tractor pulled a 14-disc grain drill over 200 acres of newly broken prairie sod, pulled a 3-section harrow over 200 acres and the same drill over 450 acres more land—all newly broken sod. I averaged 2 1/2 acres per hour with the drill. It has proven absolutely satisfactory.  
Carl F. Erbebo, Garden City, Kan.

I have pulled two 16-inch plows in sod for five hours and 4 tons on the road for eight miles with my Staude Mak-a-Tractor and the engine never boiled. I don't see that it hurts the car and it will do all the company claims.  
C. F. HARRIS, Orange Lake, N. Y.

## Let Us Prove What We Say

## Dependable Trees

Dependable Trees count for success in Orchard Growing whether home or commercial because—

- they bear early
- they bear big crops
- they bear large and marketable fruit
- fruit that brings top prices
- that fills the pocket book of the owner

**Mr. Armstrong personally guarantees that  
Armstrong Trees are Dependable**

Back of this guarantee is his worth and reputation for honest, square dealing of more than a quarter Century—

The best evidence that Armstrong Trees are developed to obtain results, and are as represented, may be secured from your Neighbor who has planted them—One pleased customer of hundreds writes—

"Trees arrived yesterday, inspected today. Inspector says they could not be any better—I am very much pleased with them." Later—"Of the large shipment of trees I received from you I only lost one tree. We all want Armstrong Trees in this neighborhood." —Mr. E. Carter, Yucaipa Valley, Calif.

Ascolano Olives

### OLIVES

In all of the olive sections of the State, Armstrong Olive Trees are known as thrifty, vigorous trees, with an abundance of fibrous roots—so essential, particularly in an olive tree, for the development of a uniform grove. In planting such trees you take no chance of finding it necessary to replant from 25 to 60 per cent of your trees.

"Your olive trees, planted here last year, have made a splendid growth, and have given perfect satisfaction." —A. W. Munn, Sacramento Co., Calif.

### WALNUTS

When you plant a Walnut tree, plant a GOOD, DEPENDABLE TREE. Armstrong Walnut trees are grafted on the native California Walnut by men who know how to make the grafts—how to take care of the tree—how to harden the wood—how to dig the tree and preserve all the root necessary to insure a strong, vigorous growth. This is INSURANCE to the planter. Our Nurseries are free from Walnut blight. Varieties—Placencia, Eureka, Neff, Mayette, Franquette.

Eureka Walnut

### APRICOT TREES

On Peach and Myrabotan roots. Extra strong, healthy, clean trees. Can supply Newcastle Early, Royal, Blenheim, Tilton, Hunskrke and Moorpark.

My Royal Apricots are propagated from the choicest strain carefully selected from the best producing trees in Southern California.

If you are planning large plantings, wire me for prices and other information desired.

### ORNAMENTAL TREES, SHRUBS and VINES

More than one-half of our big catalog is used to accurately and completely describe over 100 of the choicest varieties of Roses—Bush, Climbing, and Tree—new and old; Deciduous, Evergreen—Broadleaved and Coniferous—Trees and shrubs, Palms, Vines, Bedding and Border plants—Finely illustrated.

**we'll gladly send it—**

#### ARMSTRONG NURSERIES

Please send me a copy of your 1918 catalogue. I am planning to plant:

Peaches ☐ Apricots ☐ Plums ☐  
Pears ☐ Apples ☐ Cherries ☐  
Walnuts ☐ Almonds ☐ Ornamentals ☐

What else? ..... How much? .....

Name .....

City ..... State .....

R. F. D. or St .....

"The organization, now numbering approximately 200 members, lends an optimistic view to the success of the association. The directors are earnest and enthusiastic and will spare no pains or leave no stone unturned to secure the aim and end of the undertaking.

"At the meeting the directors voted to have a fig exhibit in the latter part of September at Fresno. All kinds of fig products—fresh, dried, canned and preserved—will be on exhibition. This is for the purpose of boosting the fig industry, encouraging rivalry and showing to the people, not only of California, but of the world, what Cali-

fornia can do when she does her best. Industry Wins

"Not many years ago merchants in California, as well as in the East, were absolute in their opinions that this state could not produce a fig equal to the imported. It took much labor and pains to overcome this prejudice. But today these same pessimists freely and gladly admit that California has done it, and they can not lavish too much praise on her for the superior article now on the market."

Now comes planning for "Fig Day" When and how, later.

## June Drop

Written for California Cultivator By Mrs. M. H. Dewey

Like all others who own an orange grove, we have speculated on the problem of the June drop and what to do to prevent it. Not only have we speculated, but we have experimented some, and the following is the result:

We have two small parcels of ground planted to olives, three years ago, which I shall number 1 and 2 for convenience. No. 1 has a few large orange trees in one corner. Two years ago we planted Blackeye beans between trees on No. 1. Beans were planted late because we were told the red spider would take them if planted early. At harvest time no red spider had made its appearance. We harvested 12 sacks of beans. Olives had made a noticeable growth over those of No. 2. Orange trees had a good crop and oranges were the best grade they had ever been.

First of June, last year we planted our five acre orange grove and No. 1 to Blackeyes, No. 2 and a vacant parcel 100 feet by 150 feet adjoining No. 1 to Bayou beans. All were drilled in on the same day, but a few lands in the orange grove had been irrigated and were damp enough to bring the beans right up, the others were irrigated after planting.

Red spider bothered the Bayous quite a bit, but the Blackeyes not at all. The yield of Bayous on parcel 100 feet by 150 feet was three sacks, 80 pounds each; yield on No. 2 averaged about the same. Trees grew well, but No. 1 about a foot taller. Our house yard and barnyard take up quite a bit of the orange grove, which would leave about six acres in Black-

eyes, yield of which was 50 sacks of beans.

Where the lands had been irrigated before planting and beans slightly, though not fully shaded the ground when the hot wave came, was the only place we had many oranges. I believe had the beans been planted as soon as danger of frost was past, so there would have been good covering for the ground, and with the light though frequent irrigation and cultivation which beans must have on red ground to make a good crop, we would not have had much of a June drop last year.

When nothing is planted between trees, they are soaked for a day or two, then have to wait a month for water, regardless of whether the weather is hot or cool, a thing we would not do with anything growing in our garden, from which we expected fruit, and trees are but larger growth of plants.

The income from the beans is quite an item even if it did not help the trees, and Blackeyes are certainly the best bean to plant on red land such as we have in Thermalito. I should like to see every grove and all the vacant land planted to them just now when we all should raise all the food we can.

We are glad to give this space if it offers a suggestion which will prevent the ordinary June drop, but as to frequent and light irrigation being best for long lived citrus orchards we think the prevailing opinion amongst citrus growers is that heavy and deep irrigation, with as long intervals as possible between to allow the warming up of the soil, is best.

## Seedling Dates

Interest in date culture continues, and certain sections of California and Arizona are well adapted to this rich fruit. Of course, it goes without saying that some unwise planters are finding serious obstacles and certain wise planters are finding the same obstacles and overcoming them. One of the most serious has been the securing of sufficient suckers for planting. These were imported from northern Africa, and hundreds of them rooted and are fruiting, but other hundreds never started. The method of inducing rooting has been studied out until far greater success is now to be had, but importations from northern Africa under war conditions are an impossibility, hence the only opportunity of increasing the planting to the extent desired is through the use of seedlings.

We recently asked Dr. Forbes, director of the University of Arizona, as to the situation there and in a personal letter he writes: "While of course seedling dates are not as good a venture as date suckers from approved varieties, yet they are the next choice when you cannot get the

suckers. Then, too, seedling trees offer the possibility of choice new varieties now and then, and in fact new varieties must originate through the planting of seeds. Our date orchards at Tempe and at Yuma, Arizona, have produced very satisfactorily this year, the weather for date ripening purposes having been beyond criticism. Even the Deglet Noor with a little artificial heat has given us an excellent product this year, although ordinarily at our altitudes and with wet weather the Deglet Noor does not perform satisfactorily."

### CALIFORNIA SUPPLIES THE WORLD

The R. M. Teague Citrus Nurseries have lately exported orders of citrus trees to the following countries; Porto Prince, Haiti; Hermosillo, Sonora, Mexico; Yokohama, Japan, and Shanghai, China. In addition to this they are billing some large orders for Texas.

### STATE BOARD OF AGRICULTURE

At the recent annual meeting of the state board of agriculture George Roeding of Fresno was elected president to succeed John M. Perry who has been president for several years. E. Franklin, Colfax, was re-elected vice president, and I. L. Borden, San Francisco, was re-elected treasurer.

# Help the Government.

Grow  
Larger  
Crops

**Late Rains Make it Important that Owners of Land Should Take Immediate Steps to Develop Water in Order to Produce More Foodstuffs**

Use Crocker Wheeler Motor

Prices for all farm products are high and going higher. The cost of farm machinery, well and pump equipment, engines and motors has not begun to keep pace with the increased cost of farm products, so that based on the return to the farmer for crops raised, Now is a good time to develop water and put in pumping plants. There is sufficient material and equipment to meet the needs of this section.

If you are five minutes late and miss a train, the chances are that you will only lose a few minutes or hours or perhaps a day, but if you delay the installation of that new pumping plant and irrigation system, you will lose a year's profits.

Get in touch with one of our salesmen or engineers, and learn at first hands the true market conditions and just what it would cost you in dollars and cents to make that unproductive land of yours produce, and then figure out for yourself what rate of interest such an investment would return to you.

Form Table below shows how the Rancher can pay the present market prices for Irrigation Plants. The number of boxes of Oranges, pounds of Beans or Cotton or Tons of Alfalfa at the present time will buy more than at any previous time; hence, our present prices are very low.

## Raise bigger crops with Planet Jr. tools

You can't meet the urgent need of cultivating increased acreage this year with old-style out-of-date tools and methods. Get Planet Jr Seeders, Wheel-Hoes and Cultivators, and double your acreage. They are strong, yet so light they can be readily used by a woman or boy. Fully guaranteed.

**No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel-Hoe, Cultivator and Plow** sows all garden seeds (in drills or hills), plows, opens furrows and covers them, hoes and cultivates all through the season. A hand-machine that does the work so easily, quickly and thoroughly that it pays for itself in a single season.

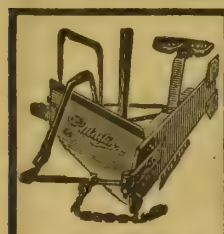

**No. 8 Horse Hoe** does a greater variety of work in corn, potatoes, tobacco, cotton, and other crops requiring similar cultivation, and does it more thoroughly than any other one-horse cultivator made. It is stronger, better made and finished. Lasts longer. Its depth regulator and extra-long frame make it steady-running. Cultivates deep or shallow and different width rows. 15 other styles of one-horse cultivators—various prices.

**SL ALLEN & CO Box 1106P Philadelphia**  
New 72-page Catalog, free!

Illustrates Planet Jr's doing actual farm and garden work, and describes over 55 different tools, including Seeders, Wheel-Hoes, Horse-Hoes, Harrows, Orchard, Beet, and Pivot-Wheel Riding Cultivators. Write postal for it today!

**No. 8**

We carry stock in Los Angeles. Agencies in all principal Pacific Coast cities.

## The Man-Saver

**THE Martin** Ditcher is a man-saver, and a time-saver—therefore a money-saver. Two men, four horses and a Martin will make or clean more ditch in **one day** than they could plow and shovel out in **three weeks**—time and man saving are big items now.

**Fine for Terracing, Dykes and Roadwork**

Made in 2, 4 and 6 horse sizes; can be used with tractor. Works equally well on side hill or level, or in wet or dry soil. Handles rocks and cuts alfalfa roots without plowing. Cuts or cleans ditches down to 4 feet deep. *All Steel, Reversible and Adjustable. Investigate the Martin NOW.*

**OWENSBORO DITCHER & GRADER CO., INC.**  
1570 Wazee Street  
Denver, Colorado

**Model 20**

**SOLD ON TRIAL**

**Catalogue Free Write For It—**

## Perforated Tree Protectors

Why use anything but a **PERFORATED PROTECTOR**, which allows free circulation of air and sunshine to gradually harden the tender bark. Practically a small **LATH HOUSE ABOUT EACH TREE**. Protects from Squirrels—Rabbits—Gophers—Hot Sun—Sand Storms—Barking in Cultivation, etc.

We make a number of kinds. **TELL US YOUR PEST**, and we will tell you what kind to buy. Get our prices. We can save you money.

**COLLAPSIBLE PLANTING POTS**

Why not raise your early Tomatoes, cabbage, chili and egg plant for home use or for market. Do you know that you can start Cucumbers, cantaloupes, melons of all kinds in these pots in flats until they have three and four leaves then plant pot and all, have melons two or three weeks earlier for market. Just the thing for Propagating Eucalyptus and Olive cuttings.

Write for samples and prices of both Pots and Protectors. State which you are interested in.

**THE EXPAN CO., 935 E. Central Ave., Redlands, Cal.**

## Good News for the Grape Growers

**T**HE board of viticultural commissioners is doing some very practical work and is now distributing grape cuttings to vineyardists. A bulletin will soon be ready for mailing, which will give valuable information. Here are the main points of the bulletin:

### Free Distribution of Grape Cuttings

In its constant desire to elevate standards of production of grape varieties in California and to offer to the country the best fruit that may be obtained anywhere in the world, this department of the state government after thoroughly discussing the subject at several meetings has decided to inaugurate practical experiments in different sections of the state in the cultivation of the vine known as the Ohanez variety of Almeria grapes. These grapes are better known to the Eastern consumers of table grapes than they are to our own California people. They are cultivated to a limited extent in this state and their presence in the markets of the East is due not to production anywhere else in this country but to extensive importations from Spain.

In normal seasons over 500,000 drums of these grapes come into the country from Spain and the method of shipment is in kegs with a packing of cork dust surrounding the bunches of grapes. The notable characteristic of this variety of grapes from the Almeria district of Spain is its keeping quality, and for many years it has had a monopoly of the Eastern market. The fruit has often commanded from 25 cents to 50 cents per pound because of being in fresh state in the winter season. Whatever competition there has been has come from California in a limited way in small shipments of our Emperor grapes which are packed in kegs or drums in redwood sawdust.

The Emperor grape is not as good a keeper as the Almeria article, and yet we believe the Spanish variety may be cultivated in this state extensively and successfully. There are a few small plantings in California now and the product of some of these vineyards has demonstrated this year their wonderful keeping qualities. The berry is of greenish cast somewhat similar to the Malaga, but very often showing spots on the surface of the berry due to a natural characteristic of the grape.

This board desires to encourage extensive experimental work in the cultivation of this variety and will send to all who inquire as long as the supply lasts a number of these cuttings, free of all expense excepting what the express charges may be from Dinuba, California, to the post office addresses of those who may wish to experiment. The cuttings will be tied in bunches of 25, and we would prefer limiting the number to each individual to 50 of such cuttings in order that the supply may serve a wide distribution. We suggest that the experimental work in this direction be attempted in almost every section of the state in order that we may observe results and be able later on to advise intelligently where these grapes may best be grown. We suggest that they be planted to some extent even in the coast counties as well as in the interior valleys and also in the foothill regions in the various localities of the state. It is only by means of such wide distribution and the planting under various climatic and soil conditions that we may

be able to ascertain just what the grape is worth to the state.

The fruit matures rather late in the season and for this very reason it may be that some localities are unsuited to its cultivation. Our experience in a limited way with the Almeria grape indicates, first of all, its wonderful keeping qualities and retention of firmness even under adverse conditions of storage. If we can produce and harvest these grapes extensively and successfully we will have made a great stride toward serving ourselves and the consumers in the Eastern markets of the country with a most delicious winter grape.

Let applications for these cuttings be directed to Board of Viticultural Commissioners, State Capitol, Sacramento, California. There will be no charge whatever for the canes and the only expense to be borne by the applicant is the slight cost of transportation.

The cuttings are being gathered now by the state board of viticultural commissioners at some considerable expense and we hope also to be able to furnish for experimental purposes a limited quantity of cuttings of the Red as well as the White Corinth. These are commonly known as the Zante currant and our country over a great period of years has relied entirely for this currant on importations from Greece, the amount imported averaging 45,000,000 pounds annually. There is no reason why we should not also produce Zante currants in California and we mention this in connection with the Almeria offerings in order that we may have some experiments also in the cultivation of the Zante currant. There are few Zante currants grown in the state in a commercial way but we have had sufficient observation to induce us to believe that there should be greater plantings of this particular variety which always commands in dried state a fancy price in the markets. There will not be at our disposal a large quantity of cuttings of the Zante currant but we will gather as many as possible and distribute them under the same auspices as above mentioned. Unlike the Almeria grape the Zante matures early and in all favored localities the drying process may be safely resorted to without more than the ordinary chance of unfavorable weather.

On receipt of applications for any of these cuttings this office will take pleasure in acknowledging the application and in giving brief and proper directions as to the method of planting. We trust that the experiments will redound to the great good of the state commercially.

### AMERICAN ASSOCIATION FOR AGRICULTURAL LEGISLATION

There has been recently formed an organization known as the American Association of Agricultural Legislation whose purpose is to investigate, initiate and promote agricultural legislation. The organization was effected at the meeting of the American Economic Association in Philadelphia. Prominent officers and members of the American Economic Association, including its president, Dr. John R. Commons, Dr. Richard T. Ely, Dr. Elwood Mead and others, felt it highly desirable that some formal recognition be given to the pressing problems affecting agricultural conditions throughout the country. Emanating out of this feeling came the new organization. The officers of the association are: President, Elwood Mead, University of California, Berkeley; vice president, G. F. Warren, Cornell University, Ithaca, New York; secretary, Richard T. Ely, University of Wisconsin, Madison; treasurer, H. C. Taylor, University of Wisconsin, Madison. All interested in the work of the association are invited to send a membership fee of \$2.00 to Dr. Richard T. Ely, Secretary, Madison, Wisconsin.

TRUNK OF BLIGHT RESISTANT PEAR IN CHINA

Agents of the United States department of agriculture have discovered in China a wild pear tree which will stand exceeding cold, is blight resistant and makes an excellent stock on which to graft. These photographs are used by permission of the department of agriculture and were taken by Frank N. Meyer, agent of the department in China. The department is calling attention to this resistant stock and is endeavoring to secure a large supply of the seed, for the trees are rapidly disappearing, as is shown in the upper picture. The research work regarding these pears has also been aided by F. C. Reimer of the Oregon agricultural station, and Mr. Reimer is now endeavoring to secure a large amount of the seed. These trees are in Chili Province. Mr. Meyer first saw them some nine years ago when the natural forest was almost untouched.

ORIGIN OF THOMPSON SEEDLESS

Wm. Robertson, secretary of the Fresno County Chamber of Commerce tells its true story. He says: "Much has been written regarding the Thompson Seedless raisin, and in some quarters an attempt has been made to cast a halo of romance and mystery around it, as to its origin. "That it got established in our midst by accident seems certain, but that it was a freak in any way, or a grape that was unknown, is an entire mistake. The real origin of this excellent vine in California was that it came in a shipment of vine rootings under a different name, which had been ordered from a well known firm of nurserymen in Rochester, New York. That firm had a reputation for handling many rare plants of different kinds and frequently gave them fancy names to cover up the real identity of the species. "When Mr. Thompson found that it was different from the others, and found also that it was a vine of merit, he immediately instituted inquiry as

to its real name and character. A good deal of speculation was indulged in as to its origin and history, and this was finally traced down to an exact record of its history. "The name Thompson Seedless is a misnomer, having been given to it as a compliment to its supposed discoverer, and has stuck to it as a commercial title for business purposes. Its true name and history are as follows: The Sultanina grape in this state, erroneously known as the Thompson

Seedless, is a variety of Persian origin, and has for many centuries been cultivated in Asia as the principal seedless raisin grape. "It was at various times introduced into the United States, and eventually came to California, through the medium of Ellwanger and Berry, who were well known nurserymen of Rochester, New York. It was sent by them under various names, the most prominent being Lady De Coverly. It was first grown by Mr. Thompson near Yuba City, after whom it was named. The first grower who planted it in Fresno County was a Mr. Blowers, now living in the Sacramento Valley. "It has been definitely shown in history that the Sultanina grape was grown in China 2400 years ago. It is also coming yearly into greater favor as a table grape."

**INSECTS AFFECTING COTTON**  
Cotton growers may write to the Division of Publications, United States Department of Agriculture and ask for Farmers Bulletin No. 890, "Insects Affecting the Cotton Plant and Ways of Combating Them," by W. Dwight Pierce.

THE SOUTH MAY PRODUCE SMYRNAS

The government authorities are interesting themselves in introducing Smyrna fig culture to the Southern states. The bringing of the blastophaga from California will make this possible. Ever since the successful establishment of the capri fig fertilizing insect in California and the production of considerable quantities of Smyrna figs on the west coast it has been the hope of many people in the South and of the department of agriculture to establish a similar industry in the Gulf States. As many people in the South know, there are in a number of towns and villages large fig trees which are sterile. Recent investigations by G. P. Rixford of the federal bureau of plant industry and George E. Murrell, horticulturist of the Southern Railway, have shown that many of these sterile trees are in reality Smyrna trees which have not borne fruit owing to the absence of the particular insect necessary to fertilize the flowers. Both male, called capri trees, and female Smyrna fig trees are present.

BELTING

The intelligent farmer of these days understands many mechanical principles; he comprehends what the scientist has proved in the relation of leguminous plants to nitrogen in the soil; what is meant by r. p. m. and by differentials, magnetos; distillate and grease; but it seems he has no conception of the difference between TEST SPECIAL belting and all the other kinds offered to farmers, with no manufacturers' guarantee to back them.

TEST SPECIAL BELTING is made to wear---to give long and satisfactory service---to give years and years of work the cheap belting doesn't do and can't do. It is foolish to buy poor belting, just as it is bad judgment to invest money in wildcat schemes---or cheap machinery that won't stand up to the work.

Write us in detail about your needs---let our engineers suggest what to use and how to apply it.

Protect belting from weather to insure longer life.

Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

## THIS WEEK'S COVER

Deodaras are amongst the most beautiful trees grown in California, and it is with pleasure that we give this week a photograph of two of the lesser known varieties which were grown by Mr. Roeding of Fresno on one of the first lands used by the Fancher Creek Nurseries. The one on the left is Cedrus deodara viridis; the one on the right, Cedrus deodara verticillata. These beautiful cedars are amongst the oldest of their kind in the state.

## W. S. S.

Bought your war savings stamps yet? If not, get at least one and start your thrift card and "do your two-bits" every once in a while. It gives you a comfortable feeling; it supplies funds for a mighty war; and it's good finance for all of us.

## SMALL POTATOES

All of us have at times eaten good home-made bread with a liberal portion of mashed potatoes in its makings. There are now millions of bushels of small potatoes in the United States not specially high priced. There is need of war bread substitutes. Let's try some small potatoes in our bread.

## CHEAP MEAT

There are sections of Arizona which have suffered very considerable losses from the depredations of rabbits. The boys are turning an honest penny and conserving food by inaugurating a series of drives and using shotguns and dogs in capturing the pests which are then turned into "canned chicken," and many a family is now eating decidedly good and inexpensive meat on otherwise "meatless" days. Kill the varmints and can 'em.

## LESS DAYS

The housewife and everybody that eats has some task these 'less days. On page 204 this week we give the new food program sent out by the food administration at Washington. We have heard housewives say: "O, yes, we observe it, but not literally; there are so many meals when we don't eat meat that we are observing the ruling in spirit." All of which is good, but we believe it better to follow to the letter as well. We are realizing more every day the awful need of the world, and this bit of economy which is asked of us is little enough for any true patriotic American.

## SUGAR BEETS

Commissioners Cogswell, Rogers and Perry are still listening to reports of sugar beet growers and finding large numbers who have planted sugar beets at a cost of around \$100 per acre and received gross return of anywhere from \$60 to \$100 per acre and apparently have determined that sugar beet growing has not been exceptionally profitable for the past two years. The hearings will continue for some days, for the manufacturers side is yet to be heard. Whether a \$10.00 price will be agreed upon we cannot say, but plainly a price much higher than the factories have been willing to pay will be made.

## WE LIKE IT

Don't you like that liberty bread? We do. The housewife makes a bit of face when she says: "But rye flour costs more, corn meal costs as much; and all the substitutes in the end are more expensive than wheat flour." And we have heard one complain because her family does not like pastries made with partial substitution of other than wheat flour. Too bad! For all such we would suggest a look across the continent and the ocean to the awful suffering of peoples actually in the war zone, then a look back at American freedom for which we are fighting, and at conditions as they exist in America; then consider seriously the slight sacrifice asked of us and eat with joy that which is really better for us than the old time fine flour.

## FIRE PREVENTION

Scarcely an evening passes but one may cast his eyes toward the hills and see the glare of the midwinter fires. Such a scene is all too common for California in summer-time, but never have Californians seen so many disastrous forest and field fires in midwinter.

The forest service is launching a fire prevention campaign. Every spear of grass is too valuable to permit of the sweeping of a single field fire, and to the end that best results may be accomplished a forest industries committee has been appointed consisting of State Forester G. M. Homans, chairman; Acting District Forester Roy Headley; Professor Woodbridge Metcalf of the college of forestry, University of California; C. Stowell Smith, secretary of the California White and Sugar Pine Manufacturers' Association; and R. E. Danaher, president of the R. E. Danaher Company.

State Forester Homans said in discussing the work of the committee: "The time has come when all interested in fire prevention must pull together. We must prevent a situation arising similar to the one in Oregon last summer when the governor found it necessary to place troops in the woods. California cannot afford to lose an acre of forage, a sack of grain, or a carload of lumber by fire. Moreover, there will be no surplus labor with which to fight fires. It will be necessary that every citizen take upon himself the responsibility for the prevention of fires."

## This Week's War News

The Central Powers have sent an ultimatum to the Rumanian government demanding that peace negotiations be begun within four days. The entire Rumanian cabinet resigned.

Notwithstanding the awful cost in her best men and her wealth, a wave of patriotism is sweeping Canada from the Pacific to the Atlantic, and volunteering is proceeding as never before.

Arrests were made of a large number of passengers on the Dutch liner, Nieuw Amsterdam, and seizures made of secret Teuton codes to be used in sending to Europe information from German spies in this country.

The trial of Bolo Pasha continues in Paris. One witness testified that he first mistrusted treason when he saw Bolo in conference with the owner of a chain of newspapers in the United States whose patriotism has been questioned.

"Poised for the opening," is believed to be the present attitude of the German forces on the French front. They are known to be rushing fresh troops to the West, and the first favorable weather condition will see a great battle.

The first treaty of peace fully completed since the beginning of the war is that of Germany with the Ukrainian republic. The Ukrainians have contended with the Bolsheviks for control of the richer southern portion of Russia, and thus far have prevailed. The final signing was on Sunday, February 10. This will release many German prisoners and open up the rich resources of southern Russia's great wheat belt to feed the Central Powers.

America fully realizes she is at war. The first transport, the Tuscania, has been sunk, with loss of over 100 lives, most of them American soldier boys. She was sunk off the north coast of Ireland at 11 p. m. February 6. Officers and men on board numbered 2173. The greater number of the 100 or more who lost their lives were wounded by the explosion of the torpedo from the submarine. Many California boys were aboard the vessel, though most of the troops were from the Middle West.

On an hour's notice President Wilson convened both houses of congress on Monday, February 11 and delivered a message which is taken as a reply to Count Czernin, Hungarian foreign minister, and von Hertling, the German chancellor. The message conveys kindly feeling toward the Austrians and commends the tone of Count Czernin's reply to the president's former message. He accuses von Hertling of being evasive, vague and even shifty. He said: "The power of the United States is a menace to no nation or people. It will never be used in aggression or for the aggrandizement of any selfish interest of our own. It springs out of freedom and is for the service of freedom."

The Bolsheviks, or believers in peace at any price, to such an extent that they caused the murder of practically all the officers and efficient fighters in the armies of Russia, now find the Teuton demands so unjust that they refuse to sign a treaty with the Central Powers. Internal conditions continue to grow worse, and murder and arson are rampant in Petrograd, Moscow, and practically all the northern provinces. The army has been demobilized. Report through German sources that the northern Russians had entirely withdrawn from the war is confirmed by statement issued by the Bolsheviks: "No military operations must again take place. The beginning of a general demobilization on all fronts is decreed."

## NORWALK TIRES

A million dollars' worth of damage each year — that's what the pear thrips is capable of doing to the fruit industry of California. Because of the minute size of the insect—the rapidity of its spread over large areas and the suddenness of attack in great numbers—the control of this pest has always been a serious problem.

We have conclusive proof, however, that it can be controlled by thoroughly spraying with

## Miscible Oil No. 2--For Thrips

This is a high gravity oil—specially prepared for this purpose—where great penetration and quick evaporation are necessary.

Miscible Oil No. 2 is a Universal Brand Spray. That means that it is uniform—that it is made from the best materials—and that its manufacture is supervised by chemists and entomologists who have had both laboratory and field experience.

Miscible Oil No. 2 will kill pear thrips in the bud better than any other spray—there is no question about it. Order your spray now.

If you will write our entomologist, Paul R. Jones—acknowledged an expert in the control of pear thrips — he will be glad to help you to decide your individual spraying problems. This expert advice is free. Write today.

Nearly a billion board feet of lumber are cut in national forests annually.

## Agricultural News Notes of the Pacific Coast

### Northern California

Farm center at Gridley, Butte County has 120 members.

The Western Canal Company will raise its levees in Butte County.

The California Bean Growers' Association is now fully organized.

A large tract of land has been leased in Yolo County for the planting of sugar beets.

Mendocino hop growers are discussing the labor situation and as to the possibility of securing more for next season's harvest.

Sacramento Valley has had less than half the normal rainfall; steps are being taken to conserve all moisture that has fallen.

At a meeting of hop growers at Ukiah a basis price of \$25 for high poles and \$30 for low poles for working hops was agreed upon.

The plant introduction garden at Chico, Butte County, is making distribution of plants. The distribution is under the direction of Superintendent R. L. Beagles.

The Northern California Stock Association recently held a meeting at Redding, Shasta County, and asked for a uniform bounty on coyote scalps within the state.

The rice mill at Woodland, which recently started for the season, contemplates grading rice so as to give the producers of better grade prices according to quality.

Butte County rice growers are objecting to shipments of oriental rice through this country in bond, maintaining that it used rolling stock that could be used in transporting American grown rice.

Placer County has a great crop, seldom referred to — ladybugs. These are being gathered by millions by E. J. Brannigan of the state horticultural commission for distribution in melon raising sections of the state.

Solano County farm bureau has divided the entire county into districts, with a captain over each district, and proposes to wipe out every squirrel in the county. The fire-fighting system, probably the best of any rural district of the state, will be continued another season.

### Southern California

Recently planted melon seeds are coming up in all sections of Imperial Valley.

Hemet, Riverside County, will have an output of about 40 carloads of oranges.

Walnut growers of Moorpark, Ventura County, netted a neat \$85,000 for the past season's crop.

Professor Bryant of the state university recently held dairy demonstration at the Stalder Ranch, Riverside.

The half rate water now available to sugar beet growers of San Fernando Valley has materially increased the planting.

The Heber Cooperative Creamery Company has been reorganized and financed and is now in operation after a short rest.

Riverside Beekeepers' Association recently elected for the coming year, president, R. Powell, secretary, E. W. Horne, Riverside.

Owing to rain shortage honey producers announce that it will be practically impossible even with later rains to produce normal crops this year.

The irrigation district board of Imperial County in its annual report shows receipts of \$1,158,646 during 1917. Operating expenses during the year were \$760,000. Taxes paid aggregated \$6,639.

For the season up to January 1, Imperial County ginned 32,494 bales of cotton. The total for the preceding year was 24,271 bales. Palo Verde Valley ginned this year 4,771 as compared with 3,967 last year.

The state highway between San Diego and El Centro, Imperial Valley will soon be completed. Nearly three-quarters of a million dollars has been the cost to the state, and it is expected the federal government will aid in this work.

### Central California

Castroville, Monterey County, now has a regularly organized farm center.

Land owners of Kings County have indorsed the Kings River conservation project.

Traveling Farm Adviser Rice, after work with the Tulare farm bureau, is now working in Kern County.

California Peach Company, Incorporated, has a slogan "Cleanest peaches and permanent demand."

Rice growers of the state are pleased at possibilities of having privilege of milling rice in transit to Eastern markets.

County Farm Adviser Jungerman of Stanislaus is discussing rice production with farmers having lands fitted for that crop.

It is sincerely hoped that there have been several million deaths in Stanislaus County. This refers to squirrels. The campaign has just ended.

The Raisin Growers and the Peach Growers' Associations, both together have recently divided up among their members well up towards \$3,000,000.

In the effort to grow cotton San Joaquin and Sacramento Valleys will center upon long staple, and the wisdom of enacting legislation preventing mixing of other types of cotton is being discussed.

The cannery at Tulare plans to double its capacity for producing tomato paste. Contracts are still being made with planters in nearby sections. It is hoped that 10,000 tons of tomatoes will be worked up at this one institution.

The food administration has named prices on various types of flour. Family flour is \$2.95 per 49 pound sack, this at Los Angeles, Stockton, Sacramento and Fresno. Entire wheat flour will be \$2.90; rye flour, \$3.05; rye meal \$3.00; barley flour, \$2.90; corn meal, white, \$3.00; yellow, \$2.75.

Irrigators of the San Joaquin Valley are appealing from the ruling of the internal revenue department that irrigation taxes may not be deducted in making payment for income tax. The department takes the ground that irrigation taxes, like street and other assessments, enhance values and are not legitimate "expense."

### The Coast and General

There are 22 cooperative cheese factories in Tillamook County, Oregon.

Washington farmers seeking for sack prices, find 25 cents to be lowest.

Fishermen taking fish from salt waters must now work under federal license.

Two ounces of wheat bread per meal at restaurants and hotels is now the limit under federal ruling.

The total value of imported beans commandeered by the federal government in various ports of the Pacific Coast this week is \$1,250,000.

The total amount of timber cut on the national forests in the fiscal year 1917 was 840,612,000 board feet, as against 714,505,000 board feet in 1916.

Senator Poindexter wired a grain convention, recently held in Washington, that he will do all in his power to have the food administration establish a primary interior grain market.

A federation of various farm organizations of Idaho was recently organized at Lewiston. Amongst affiliating organizations were The Grange, Society of Equity, State Fruit Growers' Association and Potato Growers' Union.

About 200 board feet of wood is used in the actual construction of the average airplane. To obtain this material it is ordinarily necessary to work over about 1500 feet of select lumber, which often represents all that can be used for airplanes of 15,000 board feet of standing timber.

Wool growers of Washington recently met at Yakima and resolved to answer the government's appeal for greater production, and to the end that greatest production could be secured, appeal to Secretary Lane of the Interior for the opening of Rainier national park for summer grazing.

## Extra Strong Weights Less Big Capacity

**E**VERY farmer owning a Tractor should also have a Baling Press. It extends the use of your Tractor, and makes money where your engine would ordinarily stand idle. You can not only take care of your own hay, which brings more money when baled, but there is always an opportunity to do custom baling for your neighbors.

Case Baling Presses have extraordinary features not found in other machines. Case Balers handle extra large feeds without danger of breakage.

Case belt power Balers are built in two sizes, 14x18 inches and 17x22 inches. The former has a capacity of 3 to 4 tons per hour, and the latter 3½ to 5 tons per hour.

They are constructed entirely of the best steel, the frame extra heavy and hot riveted. This keeps all parts permanently in line, and eliminates an endless amount of trouble found in balers constructed of wood and cast iron.

In addition, we also manufacture a sweep power press for those who do not require the capacity of belt power balers. Write today for our booklet which describes Case Hay Balers in detail, with pictures. A copy will be sent free for the asking.

We also call your attention to the other Case power farming machinery named below, should you wish information regarding Tractors, Threshers, etc.

## A Menace to Our Future

Land Speculators Greatest Bane of the State. Rich Acres Bought at Low Prices in Large Tracts and Re-sold to the Uninformed at Prices Which Prevent Success.

AND speculators who have unduly advanced prices have much to answer for to well wishers of California. There is legitimate advance which comes with improvements and advantages and with market conditions, which make it possible to purchase and sell at a profit, and there are other advances in price which are beyond reason and which result in ruining the farmer, or would-be farmer, who is not wise in figuring production costs. The California land settlement commission made an investigation regarding methods, and this investigation brought out facts which should help more settlers with cool heads to estimate the chances for success in their chosen line of farming. Another great help in this line is "What the Settler Should Know," written by Thomas Forsyth Hunt, but unfortunately the "back to the land" appeal comes to a class of people with limited means and with a desire to be their "own boss" with such effect that reason is forced to the winds and a small "down payment" made at the time, leaving the cost of living and future payment on the land to be made out of the soil. This has led to untold suffering, entire loss of some families' holdings, and, least of all perhaps, to the discredit of the state. Our land settlement commission is today taking a hand and will in time educate our people. Meantime chambers of commerce can aid materially in discouraging this type of promotion work, and many such bodies have already taken action along this line.

One of our readers, R. Gilhousen of Los Angeles County, referring to an immense tract of land near the central part of the state which was bought for \$18 per acre and later sold for an average of \$156, and to other smaller settlement propositions, says:

"There are a number of these colonization companies, as they call themselves. More truthfully speaking they should be called, 'Get Rich Quick Companies,' for their sole object in operating is not for the good of the state or the welfare of the homeseeker, but the enrichment of the land speculator.

"There is some good land in some of these colonies though a great por-

tion of it is very inferior for farming purposes. There are four grades of this poor land, any of which the inexperienced can be deceived in, namely: alkali, hardpan, poor sand, and hog-wallow.

"These companies have their local agents in all California. Their business is to hunt up men who are trying to act on the much published advice, 'Get back to the land,' and who either have property or money enough to make a first payment on a tract of land. On their arrival in the colony they are taken to see some of the best land and some of the best improved places and to interview certain men while being steered clear of others. They are given the impression that the land is all equally productive and that it is easy to pay out on the land from the proceeds of the crops.

"These are the facts: In places the settlers are going out as fast as they are coming in, leaving their improvements and the companies keeping whatever payments they may have made. Numbers of men who have passed the meridian of life have been forced to go and leave their life's hard earnings in the hands of these heartless and soulless companies. The company men will then whitewash the buildings and sow a little barley. When the barley gets green the trap is sprung on another victim to the tune of \$25 an acre in advance for the improvements.

"When you consider that much of this land would not rent for two dollars an acre and that \$150 an acre at six per cent means nine dollars an acre cash rent, you can understand something of the 'con' game. When the settler has to put in his own pumping plant which costs him from \$1000 up, pay the taxes, put on his improvements and pay one-tenth of the principal yearly, it will be seen how effectively he is trapped and hopelessly stung.

"I respectfully ask, 'Has the state no interest in the welfare of its citizens?' The government should act at once to give the needy and willing worker access to his God-given heritage, 'Mother Earth,' and at the same time choke off these blood-sucking vampires."

## The New Food Program

The food administration asks every loyal American to help win the war by maintaining rigidly as a minimum of saving the following program:

Two wheatless days (Monday and Wednesday) in every week and one wheatless meal in every day.

Explanation: On wheatless days and in wheatless meals of other days use no crackers, pastry, macaroni, breakfast food or other cereal food containing wheat, and use no wheat flour in any form except the small amount that may be needed for thickening soups or gravies or for a binder in corn bread and other cereal breads. As to bread: if you bake it at home, use other cereals than wheat, and if you buy it, buy only war bread. Our object is that we should buy and consume one-third less wheat products than we did last year.

One meatless day (Thursday) in every week (not in California at pres-

ent) and one meatless meal in every day. Have two porkless days (Tuesday and Saturday) in every week. Explanation: Meatless means without any cattle, hog or sheep products. On other days use mutton and lamb in preference to beef or pork. Porkless means without pork, bacon, ham, lard or pork products, fresh or preserved. Use fish, poultry and eggs. As a nation, we eat and waste nearly twice as much meat as we need.

Make every day a fat saving day (butter, lard, lard substitutes, etc.). Explanation: Fry less; bake, broil, boil or stew foods instead. Save meat drippings. Use them and vegetable oils for cooking instead of butter. Butter has food values vital to children, therefore give it to them. Use it only on the table. Waste no soap. It is made from fat. Be careful of all fats. We use and waste two and a half times as much fat as we need.

# Kirkman Nurseries

Established 1888

Wholesale Growers of

## High-Grade Nursery Stock

DECIDUOUS AND CITRUS FRUITS

OLIVES AND GRAPE VINES  
SHADE AND ORNAMENTAL TREES

Twenty-nine years of continuous and consistent service to the Western fruit growers.

There is a shortage of trees this year. To make sure of getting just what you want, place your order now.

Address Main Office

2522 Tulare Street  
Fresno, Cal.

Make every day a sugar saving day. Explanation: Use less sugar. Less sweet beverages and candy containing sugar should be used in war times. As a nation we have used twice as much sugar as we need.

Use fruits, vegetables and potatoes abundantly. Explanation: These foods are healthful and plentiful and at the same time partly take the place of other foods which we must save. Raise all you can for home use.

Use milk wisely. Explanation: Use all of the milk. Waste no part of it. The children must have whole milk. Use sour and skim milk in cooking and for cottage cheese.

### Hoarding Food

Anyone buying and holding a larger supply of food now than in peace time, except foods canned, dried or preserved, in the home, is helping to defeat the food administration in its attempt to secure a just division of food and the establishment of fair prices. The food hoarder is working against the common good and even against the very safety of the country. Hoarding food in households is both selfish and unnecessary. The government is protecting the food supply of its people.

### PLACER COUNTY FARM BUREAU MEETING

The board of directors of the Placer County Farm Bureau (this includes vice directors and directors-at-large) is called to meet at the Auburn Hotel, on Saturday, February 23, at 10 a. m. Of importance are the following reports: Lime Committee on Rattlesnake lime prospects; lime report by J. A. Teagarden on Mt. Quarry prospects; assistant farm adviser committee preliminary report; cold storage trip report; selection of three directors and substitutes to attend the annual farm bureau conference, March 11-16, at Berkeley. Tuesday, Wednesday, Thursday, Friday and Saturday will be spent in an auto tour of the counties between Berkeley and Bakersfield.

We also should arrange to have our entire board at one-day conference at Berkeley, March 11. We can drive down on Saturday and return Tuesday. Farm Adviser Amundsen will present the important farm bureau activities in regular project form. These will include the work in securing lime, cold storage plants, purchasing and marketing, farmers' mutual fire insurance, road names and signs, farm names, etc. At future meetings each project will be reported and progress noted until completed. Farm bureau members are invited to attend this meeting. All are requested to be on hand promptly on time.—J. A. Teagarden, president; Edw. O. Amundsen, farm adviser.

### FORESTRY WORK IN THE ARMY

Any young man who may wish to serve abroad in forest service, lumbering or construction work, in bridge building or similar lines should write at once to Forester, Washington, D. C. He says 6000 men, lumber jacks, saw mill workers, experienced builders to serve in saw mill units and in road building battalions will be needed. He also wants men familiar with operating of rock crushers, road rollers, scrapers, motor trucks, etc. A very limited training and drilling in this country is given and men are sent across as rapidly as possible.

Other men are called for in the service, such as mechanical draftsmen who have had experience in mechanical engineering, especially college men who have had training in engineering are needed as assistants to marine superintendents and assistant superintending engineers. For these last services mentioned, write Military Information Office, University of California, 114 California Hall, Berkeley.

**"The best advice you ever gave me — I bought a John Deere Tractor Plow —"**

And it has proved to be one of the best bargains I ever made."

That Northern Iowa farmer had expected much and had realized more. He was more than satisfied. He was enthusiastic.

The money-making seed beds and the money-saving operation of a

## JOHN DEERE TRACTOR PLOW

make every owner enthusiastic over his bargain. The owner of a John Deere Tractor Plow gets the benefit of genuine John Deere bottoms—the world's standard bottoms, found only on John Deere plows. These bottoms outwear others and make the best seed beds that a plow can make.

The owner of a John Deere Tractor Plow gets the greatest possible operating economy. The Quick Detachable Shares save valuable time and labor. The powerful power lift raises and lowers the bottoms quickly and accurately. No chains or sprockets about the mechanism to cause trouble. Great beam-throat clearance prevents clogging. Stiff hitch assures perfect control in pulling, turning or

backing. Perfect balance assures light draft and fuel saving.

The John Deere No. 5 Tractor Plow is furnished with either 2 or 3 bottoms. The No. 6 is furnished with either 3 or 4 bottoms. Insist on one of these plows for your tractor.

### Get These Free Books

Write today for our free booklet describing both the No. 5 and No. 6 John Deere Tractor Plows. Also our 156-page book "Better Farm Implements and How to Use Them." Full of practical information. Worth dollars.

To get these books, tell us what farm implements you are interested in and ask for package TP-34.

JOHN DEERE, Moline, Ill.

# WHAT'S A BRED BERKSHIRE SOW WORTH???

In view of the fact that our Government and our Allies need more pork, And that our Government has set a minimum price of 14½ cents per pound at Coast points, And that California Berkshires were Grand Champions at the National Swine Show, And that the BERKSHIRE BREED was GRAND CHAMPION over all breeds, grades and crosses at the INTERNATIONAL;

*There's Just One Answer*

It's your patriotic duty to raise more pork; It's profitable to raise more pork; The best Berkshire blood in the country is in California; And THE BEST BREED OF HOGS IS THE BERKSHIRE; the first prize heavy carcass dressed 88.77 per cent.

*You Set Your Own Price*

There will be 50 BRED BERKSHIRE SOWS sold to the highest bidder, at Davis, Cal., February 22nd, starting at 10:00 A. M. sharp. There will be a meeting of Berkshire Breeders all day and evening of the 21st, same place, and we are going to GIVE FREE, as prizes, a number of BERKSHIRE BOAR and SOW PIGS, to the best judges among the Farmers and their Wives.

Every sow in the sale is guaranteed to be as represented, and the buyer of any sow sold as being bred and proving to be not with pig, can, if the claim is proven to the secretary within six weeks of sale day, receive a refund of 20 per cent of the purchase price.

Every one is invited to attend both meeting and sale

**WESTERN BERKSHIRE CONGRESS** F. R. Steel, Pres., Grants Pass, Ore.

## Think Once More!

for the head of our herd is PRINCE ALCARTRA KORNDYKE, son of Tilly Alcartra, 40.78 pounds butter in seven days, and she is the only 40 pound cow in the world that has a yearly record above 1100 pounds butter, two yearly records above 1100 pounds butter, three yearly records above 1042 pounds butter, and she holds all the world's milk records from two to five years, and is the only cow in the world that has produced a total of 123,351.3 pounds milk and 4819.12 pounds butter in her first five lactation periods.

PRINCE ALCARTRA KORNDYKE is sired by Korndyke Queen De Kol's Prince, famous for the high production of his

backed by the greatest combination of short and long time production records yet known

daughters and size and type of both sons and daughters. His 89 A. B. O. daughters include one with 1090 pounds butter in one year, four with records from 30 to 35.42 pounds butter in seven days. PRINCE ALCARTRA KORNDYKE himself is a proven transmitting sire, for his first five two year old daughters to complete yearly test average 15,333 pounds milk and 675.92 pounds butter. You will invest wisely if you place one of his sons at the head of your herd. We have only a few left, out of good record dams, and priced well within their value.

Miss Big Bone

A Red Cross offering, donated by Mark Bassett. She will be auctioned at the Kings County Poland-China Breeders' Sale.

## Kings County Poland-China Sale

The Kings County Poland-China Breeders' Association will hold its fifth semi-annual sale at Hanford on the county fair grounds, February 20. The animals consigned to the sale will be on the grounds for several days preceding the sale that they may be inspected by intending purchasers.

On the evening preceding the sale, February 19, at seven p. m., will be held a banquet and meeting of the State Poland-China Breeders' Association. W. Bernstein is sending out over his name a cordial invitation to the Poland-China breeders of the state to attend. He writes:

"The purpose of this meeting is the consideration of an extremely important subject, viz: 'Shall the organization lend its support to the movement to have a Roundup Futurity show this coming fall, possibly at

Portland, as that is the last place a show will be held. The following resolution, which has been adopted by the Oregon association will also be discussed: Resolved: That to conserve the nation's food supply we recommend the elimination of all breeding classes of swine over one year of age at all international, national, state and county fairs in the United States during the period of the present year."

One of the most patriotic breeders in California is Mark Bassett, the Kings County Poland-China breeder. He has one son in the service and two ready for such service as the country may ask. In addition we notice that at the coming sale of Kings County Poland-Chinas he offers one of his finest young gilts to be sold, the entire returns to be donated to the Red Cross. See picture of Miss Big Bone with this article.

## Auctioning the Hogs

Kern County Farm Bureau Conducting Series of Successful Sales. Account of Sales Written by J. H. Yetter of the Cultivator Force. Photos by Cultivator Photographer.

**K**ERN County, through its very efficient farm adviser, George C. Kreutzer, has a new version of "This Little Pig Went to Market," that is netting the members of the county farm bureau, who have hogs to sell,

from one-half to one cent, more per pound than they otherwise would receive. The new marketing idea has been thoroughly demonstrated to be sound economically and has proven so successful that inquiry is coming from many sources as to just what the plan

As the Farmers Bring Them In  
Wagon loads of Kern County hogs brought to the farm bureau sale.

Kern County Hog Growers' Sale

These sales are becoming a regular feature with the farm bureau of Kern County and with each sale their popularity increases. A fine bunch of stock is brought together which encourages liberal bidding.

**CUTTER'S  
BLACKLEG PILLS**  
"California's Favorite"  
for nearly 20 years  
For the Prevention of Blackleg  
in calves and young cattle

Their superiority is due to nearly 20 years of specializing in "Vaccines and Serums only."

Year in and Year Out they give better satisfaction than any other vaccine made, and the cost of a few cents per dose is cheap insurance against a disease that always takes the fattest and best.

Single Pills may be used for ordinary and range stock.

Double Pills should be used for pure bred and high grade stock.

Use any Injector, but Cutter's simplest and strongest.

Prices:  
10 dose pkge. Single pills \$1.00  
50 dose pkge. Single pills 4.00  
10 dose pkge. Double Pills 1.50  
50 dose pkge. Double Pills 6.00  
Cutter's Pill Injector.... 1.50

Insist on Cutter's. If unobtainable, order direct.

Write for new booklet, "The Control of Blackleg." It tells about Anti-Blackleg Serum which cures Blackleg and may be used simultaneously with vaccine to combat outbreaks and safely protect valuable stock.

**Bernstein's Ranch**  
Hanford      Calif.

**It is Not an Accident**

when a bull sires a long list of high producing daughters when he himself is the result of many generations of matings of high producers, and such a bull is

**Dutchland Sir Pieterje Creamelle**

whose sire is by Pieterje Hengerveld's Count De Kol and out of the great transmitting cow Changeling. His dam is a daughter of the former world's record cow Creamelle Vale, and is by a grandson of De Kol 2nd, the foundation cow of the De Kol family.

**DUTCHLAND SIR PIETERJE CREAMELLE** now has 14 A. B. O. daughters, all records made in our herd, and he has had only a limited opportunity as our original herd of breeding cows was small. All of his daughters are heavy milkers with a normal high percentage of butter fat. His first daughter to freshen as a three year old made over 80 pounds butter in seven days. If you would breed better type into your herd, coupled with large milk flow and high butter fat test, secure one of the young sons of this sire that we now offer. Priced right.

**F. STENZEL**  
San Lorenzo      California

Fresno County Y. M. C. A. contemplating establishing labor camps in various portions of Fresno County.

is. Through its operation one of the members, H. G. Hull of Wasco, who had 98 head of hogs weighing 21,325 pounds in one sale, received \$16.60 per hundred f. o. b. shipping point for them, when the market in Los Angeles on the same day was 17 cents. This is believed to be the highest price paid direct to the producer anywhere in the state, if not in the United States, for fat hogs, and the selling cost amounted to only one per cent.

"There really isn't anything so very unusual about this plan," said Mr. Kreutzer to a California Cultivator representative. "You see, we figured it out that if we could get all the farmers who had fat hogs to sell at about the same time, to bring them together, and we could get all the buyers there who were making a business of buying hogs here, we could make the hogs up in nice fat, medium and light weight lots, giving the best grading that the hogs collectively would allow, and then having several carloads to bid on would save the buyers considerable time instead of running around over the country buying and making up shipments. Of course it wasn't all as easy as it looked. While this plan seems to be, and is new, yet our first sale was held nearly a year ago with fair success, and with each succeeding sale we have profited by the experiences gained at the former ones. The principal features of our marketing scheme are these:

"First. The farmers are canvassed by inquiry as to whether they have enough hogs to sell to make a sale, if so, a committee of five from the county at large determines the time and location of the sale and makes general arrangements.

"Second. We notify all the packing houses or their representatives in Los Angeles and San Francisco and our local buyers, that we will offer fat hogs for sale giving the time and place and as near the number and quality as possible.

"Third. We study the Eastern and Western markets ourselves, and a buyer representing the farmers joins in the bidding. He is a man selected for his knowledge of the markets and he bids according to what the hogs are worth, just the same as though he were buying them for himself.

"Fourth. One of the members of the county farm bureau acts as the auctioneer at a flat rate previously agreed upon. The farm bureau charges the farmer one per cent for making the sale.

"Fifth. As the hogs are brought in a committee of three in the membership where the sale is held receives the hogs for sale and grades them. This gives opportunity of eliminating any from any bunch that would cut down the value of the good ones. By putting all the good ones together and taking out the odd sizes and mating them up in lots according to how they will sell best we have the best lots that we can make up for the buyers to bid on. The local committee of three acts as judges or umpires or whatever one chooses to call them and their decision is final on the classification and on the sale and final disposition of hogs left in their care for sale.

"The result of this arrangement is that a man can sell his fat hogs at the lowest expense and under the most favorable circumstances. Sometimes it has happened that a man with only a few hogs could not get a buyer or two or three buyers to drive several miles to see them. Under our arrangement a man can put into the sale one hog or several car loads. The hogs are all weighed and designated by lots and the owners paid according to what each lot brought in the bidding. Where they don't quite weigh out after a few hours in the pens, the tare is deducted proportionately and the selling, bookkeeping and paying, all done on a cash basis is handled as smoothly and scientifically as in our country's large stock yards."

"Have you always found a keen demand for hogs?" was asked.

"I will say," said Mr. Kreutzer, "that I believe the representatives of the packing houses and our local buyers have always paid all they could according to the Los Angeles and San Francisco markets. The buyers have been very prompt in responding and ready to bid. They seem to appreciate the fact that this method of buying so many fat hogs together saves them considerable expense in time and traveling through the country."

Continued on Page 219

### Three Important Reasons For Buying a NEW DE LAVAL CREAM SEPARATOR At Once

There are three very strong reasons for the immediate purchase of an up-to-date De Laval Cream Separator.

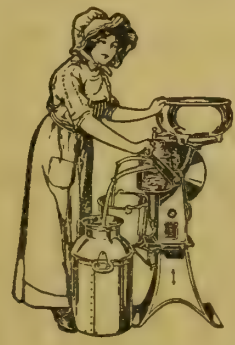

In the first place, a new De Laval machine will now save its cost in a few months—in more and better cream and butter and in time saving—at the present very high butter prices and great need of every minute of time.

In the second place, the patriotic duty rests upon every producer of butter-fat to save every ounce of it, and nothing is of greater food value to a nation at war. All European countries are encouraging the sale of the best cream separators in every way possible.

In the third place, railway delays are such that you can't depend upon quick delivery, and if you don't order your De Laval now there is no telling when you can get it. Moreover, the supply of labor and material is uncertain and all last year De Laval deliveries were nearly two months behind.

Again, De Laval prices have advanced very little thus far but must go higher if present industrial conditions continue, let alone become more difficult. Present prices hold good until March 1st only.

There was never a time when the immediate purchase of a latest improved De Laval Cream Separator was more important to everyone separating cream, or when it could less wisely be delayed.

See the nearest De Laval agent at once. Arrange to try a new De Laval machine for your own satisfaction. See for yourself just what it will do for you. If you don't know the nearest agent simply address the nearest General Office.

### Do you want better dairy cows?

You can have them if you will study carefully the bull you select for service in your herd and get one from breeding that has proved to be in the first rank both for production and individuality. You can get such a bull in one of our young sons of

**PRINCE RIVERSIDE WALKER**

Who that has observed carefully the daughters and granddaughters of his sire, Prince Gelsche Walker, has not been impressed with their great capacity, splendid udders, and high dairy quality.

Who that has observed carefully his dam, Aaggie Acme of Riverside, has not been impressed with her almost grand champion bull out of the junior ideal dairy cow conformation? And her sire a champion female at the St. Louis Exposition.

And for the proof of power to transmit production, look at the dam of Prince Gelsche Walker, who is a 30 pound cow out of a 31 pound daughter of a 32 pound cow. And Aaggie Acme of Riverside is by a sire that has three daughters with records above 1000 pounds butter in one year, and she herself is the dam of the world's official yearly butter record cow, Aaggie Acme of Riverside 2nd. Not to overlook the fact that Prince Gelsche Walker is the sire of the heifer that holds the world's records for butter in seven days eight months after calving in both the senior two year old and junior three year old classes.

This is only a very brief sketch of the production, transmitting power, and splendid individuality behind Prince Riverside Walker, and while none of his daughters have yet reached milking age they are of most satisfactory type and promise. One of his young sons would surely work an improvement in your herd, and we can supply you with one at a modest price.

## Range Feed Suggestions

Don't Turn Cattle on the Range and Forget Them. Keep Watch!

LIVESTOCK Specialist Geo. W. Barnes of Arizona makes these practical suggestions:

In order to suggest and work out a satisfactory and practical scheme of range maintenance for Arizona, it would first be advisable to understand the causes which have been instrumental in causing deterioration of the grazing section.

The first and major cause has been over-grazing, and may come under several phases such as keeping too many animals on a given area, having watering places too far apart, keeping the herds or bands too long to a given section, failing to make proper allowance for a poor, dry season on some of the animal ranges.

Due to the fact that no restrictions were placed upon the free range, it was subject to great overcrowding. Many no doubt will say that they can see no apparent result from overstocking. This in a measure may be true, but the effects are certainly accumulative. In many sections settlers have come in, forming part of what once was range, and trails and paths leading to water become more and more traveled. This has had its effect, not only by too close cropping of the grass and browse, but by tramping out the grass, so that the soil will work and oftentimes large arroyos are

formed. When the soil is packed by animals its physical condition is injured and is often so closely tramped that plant growth is prevented. These effects are more noticeable about watering places which are not properly equipped for watering range stock.

Those who have watched the practice not only in Arizona but other range sections have noticed that when overstocking is practiced deterioration is hastened and a selective process goes on, the best plants being eaten closer and are the first to disappear. Plants thus weakened cease to be the main forage, and a less valuable plant, often a poisonous plant, then takes their place and becomes the leading species. This change comes about gradually, and is seldom noticed until a new plant is found oftentimes to be worthless as stock feed. The range man should notice the principal forage plants and grasses upon his ranch upon which cattle feed and watch them to ascertain if they are increasing or diminishing; by this method he would have some check in regards to condition, and could take steps necessary towards range improvement. A careful watch should be made to detect any undesirable or poisonous plant which may be scattered only occasionally over the range and by destroying these plants keep same under control and prevent them from spreading.

## A Leading Young Sire

When we take stock of the Holstein sires in service in California today, a place among the leaders belongs to Dutchland Sir Pietertje Creamelle. This bull was selected by Mr. Stenzel owned by F. Stenzel, San Lorenzo, as a herd sire right close to his beginning as a breeder of registered Holsteins and for the first two or three years he was therefore mated with only a very limited number of registered cows. The result is that his present list of A. R. O. daughters includes all of his registered daughters that have come into milk.

He is a bull of most desirable breeding, his sire being Dutchland Sir Pietertje Hengerveld, whose sire is Pietertje Hengerveld's Count De Kol and whose dam is the great transmitting cow Changeling. His dam is a 23 pound four year old daughter of Pontiac Butter Boy and the former world's record cow Creamelle Vale, 1155.85 pounds butter in one year. It is also worthy of mention in estimating his pedigree, that the mating of his paternal granddam Changeling, with his maternal grandsire Pontiac Butter Boy, produced the great bull Changeling Butter Boy, among whose daughters are Changeling Tidy Abbecker, 44.43 pounds butter in seven days, Changeling Tidy Abbecker Gem, 34.74 pounds butter in seven days, and Previous 2nd Changeling, 33.25 pounds butter in seven days.

But it is the performance of the bull himself that finally counts through his daughters, and it is here that Dutchland Sir Pietertje Creamelle proves his real worth. Bred to only a limited number of cows at first he now has 14 A. R. O. daughters as follows with following records butter in seven days:

Korndyke Ormsby Creamelle, senior three, 30.45; Lady Starin Pontiac Creamelle, junior three, 28.36; Pauline Inka De Kol Creamelle, senior

yearling, 24.43; Marie Clothilde Pontiac Creamelle, junior two, 22.52; Pauline Inka Creamelle, junior two, 21.10; Estudillo Princess Creamelle, senior two, 20.96; Korndyke Pietertje Creamelle, junior two, 19.50; Estudillo Bonnie Creamelle, junior two, 19.06; Jessie Clothilde De Kol Creamelle, junior two, 17.50; Maggie Beets De Kol Creamelle, senior two, 17.10; Kalsora Segis Korndyke Creamelle, senior yearling, 16.70; Witkop Aaggie Pontiac Creamelle, senior two, 16.50; Marie De Witt Creamelle, senior yearling, 15.45; Witkop Aaggie Creamelle Pontiac, junior two, 15.00.

It will be noted that these records were made at very young ages and that the first one to freshen as a three year old made over 30 pounds butter in seven days and the next one over 28 pounds. The daughters of this sire are uniformly good testers with a good flow of milk, a characteristic that is much sought for among present day breeders, and these things taken together seem to mark Dutchland Sir Pietertje Creamelle as one of the best Holstein sires yet developed in California.

### WESTERN BERKSHIRE CONGRESS MEETING AND SALE AT DAVIS

The coming Western Berkshire Congress meeting and sale at Davis, February 21-22, promises to be the most successful of any yet held.

The fact that a California herd brought back grand champion boar and grand champion sow from the National Swine Show proves that the best blood of the breed is in California; and if there was ever any doubt about breed superiority, that doubt was set at rest at the International at Chicago, where the Berkshires, in competition with all breeds grades and crosses, won grand champion barrow, grand champion pen of barrows and grand champion carload

**Whittier State School**

**WHITTIER, CALIFORNIA**

a record never equaled by any other breed. Also first, second and third in heavy carcass contest, and the first prize carcass dressed 88.77 per cent.

The action of the United States food administration in setting a minimum price of 14½ cents for pork at Pacific coast points has guaranteed the producer against loss, and already its influence can be felt in an increased interest in breeding stock.

It is the patriotic duty of everyone to increase the production of pork to the utmost, and along this line the Western Berkshire Congress is giving away a number of registered boar and sow pigs as prizes in judging contests. Any bona fide farmer, or his wife, who does not raise pure bred hogs for breeding stock, is eligible to compete.

Then there will be an outstanding boar, "Red Cross Rival," by name, sold to the highest bidder, and the proceeds of the sale will go to the chapter of the Red Cross of which the purchaser is a member.

Then last, but by no means least, there will be 50 bred sows sold to the highest bidder. These sows are guaranteed by the Western Berkshire Congress to be as represented. Claims to be filed with secretary not later than six weeks after date of sale.

The best herds on this coast have contributed to this consignment and the richest blood of the breed is represented.

The grand champion boar of Omaha, Baron Duke 201st, will be on exhibition.

Everyone is cordially invited to attend this meeting and sale at the University Farm, Davis, February 21 and 22, 1918. Sale starts at 10 a. m. Friday, the 22nd. — Homer Hewins, Jr., Secretary.

### DRIED DEVIL FISH FOR HEAVES

Mrs. Flora Woodruff of Corcoran writes as to remedy for heaves. She assures us that this remedy was secured from an old Spanish fisherman near Pismo Beach who assured her that dried devil fish was a sure cure for the heaves. She says: "We had a horse which had been affected for sometime with the heaves, which has been entirely cured and is now working and used on the road. It is however necessary to keep some of the devil fish tied on the bit all the time." Mrs. Woodruff suggests we pass this on to other horse owners.

### BREEDS OF DAIRY CATTLE

Farmers Bulletin No. 893 is being mailed by the United States department of agriculture. It has 36 pages and touches upon factors to be considered in the selection of a breed, giving origin and history of Ayrshire, Brown Swiss, Guernsey, Holstein-Friesian and Jersey. The bulletin will be of interest to all dairy men. Copies may be had by writing Division of Publications, United States Department of Agriculture, Washington, D. C.

### JUDGING SHEEP

Bulletin No. 593, United States department of agriculture, primarily intended for the public schools, is of interest to every sheep breeder. This bulletin is ten cents per copy. Write Division of Publications, Government Printing Office, Washington, D. C.

The high price of other meats has increased the consumption of poultry and eggs on farms to the extent that the reduction in poultry receipts this fall has been apparent at nearly all receiving centers.

After the war the world's herds and flocks will be depleted, insuring the American producer high prices for many years to come. Now is the time to prepare.

## REGISTERED HOLSTEINS

No greater conservation of feed, labor, and money can be made by the dairyman of today than by placing at the head of his herd the right kind of a herd sire.

A registered purebred Holstein bull of good breeding will get the kind of heifers that develop into profitable dairy cows, able to convert the feed they consume into profitable milk and butter production. The overhead expense, including labor, of handling a GOOD dairy cow is no greater than for a boarder, and the only way to breed GOOD cows is to use a GOOD purebred registered bull.

Right now we are offering a limited number of GOOD young bulls sired by

### MERCI LAD KORNDYKE BURKE

conceded to be one of the greatest individual Holstein bulls in the west, and as to his breeding—

He is sired by the noted individual and sire De Kol Hengerveld Burke, one of the greatest sons of De Kol 2nd's Butter Boy 3d, and his dam is that wonderful producer Winnie Korndyke Cornucopia De Kol, 31,034.14 pounds milk and 1201.06 pounds butter in one year, the first cow in California to produce over 1200 pounds butter in one year.

MERCI LAD KORNDYKE BURKE is siring a wonderful lot of calves. Come and see his beautiful sons and daughters and we feel sure you will decide to select one of his young sons to head your herd.

Inquiries or orders by mail will receive prompt attention.

SANTA ANITA RANCHO, Santa Anita, Cal.

W. H. Taylor, Supt.

Anita M. Baldwin, Owner

*Come to Stanislaus County for Registered Holsteins*

STANISLAUS COUNTY LEADS

All counties of California in number of herds of registered Holsteins and number of 30 pound sires in service.

**Registered Holsteins**  
Young sons of Prince Hiske Walker out of A. R. O. dams for sale.  
H. E. Cornwell, Rt. B, Box 183, Modesto, Cal.

**White House Holsteins**  
A well bred proven herd sire for sale, also a few bull calves.  
A. M. Bibens, Rt. 1, Box 307, Modesto, Cal.

### Creamcup Holsteins

Headed by the 33.92 pound bull Creamcup Champion Pontiac Burke. A few young bulls for sale. W. HOLDRIDGE, Rt. B, Box 366, Modesto, Cal.

**Sylvan Iris Holsteins**  
Headed by a son of Dutchland Sir Pietertje Creamelle. Well bred young bulls and a few registered heifers for sale. E. F. Young, Rt. B, Box 174, Modesto.

**Pelandale Holsteins**  
Headed by Hazelwood Mercedes Posch Ormsby. Good young bulls and a few registered cows for sale.  
J. A. Pelanda, Rt. B, Modesto, Cal.

**Segis Pontiac De Kol Dutch**  
Whose three nearest dams are 1000 pound cows that average over 30 pounds in 7 days, heads my herd. Bull calves for sale. E. E. Freeman, Rt. B, Modesto

### Registered Holsteins

Herd headed by a 30 pound grandson of Colantha Johanna Lad and a 32 pound grandson of Rag Apple Korndyke. My cows have won butter fat contests wherever entered. Young bulls for sale. Visitors welcome.  
J. W. Benoit, Rt. C, Box 183, Modesto, Cal.

**Thompson's Registered Holsteins**  
Service age grandson Winifred Hotelling 2nd, 33.92 pounds butter in seven days for sale. Also two bull calves, yearly record backing.  
Luther Thompson, Rt. A, Box 351, Modesto, Cal.

**Our Herd Has Been Built Around King Korndyke Hengerveld Ormsby 7th**  
A grandson of Pietertje Maid Ormsby, 35.56 pounds butter seven days, 145.66 pounds 30 days, who is sister to the sire of Duchess Skylark Ormsby, 1506 pounds butter one year, world's record. King Korndyke Hengerveld Ormsby 7th was grand champion at Stanislaus Live Stock Exposition, winning over the bull that defeated the California State Fair grand champion. Young bulls for sale. No females.

Kounias Registered Stock Farm, Modesto, Cal.

## BASSETT'S POLAND-CHINAS

Twenty of our best bred gilts will be consigned to the

KINGS COUNTY SALE  
AT HANFORD  
FEBRUARY 20

They are all bred to our best boars. You can buy them at your own price.

For many years, at widely separated show rings, under many different judges of varying type ideals, my Poland-Chinas have been consistent prize-winners. My herd is large and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland-China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

FAIR DEALING, UNIFORM EXCELLENCE, SATISFIED CUSTOMERS, BEST PORK PRODUCERS, RESULT FROM YEARS OF SELECTIVE BREEDING.

M. Bassett

Hanford, Cal.

MAMMOTH HUSTLER

Full sister to Miss Big Bone in the Sale February 20.

### Field Notes From the Live Stock Men

H. B. Peake of San Bernardino writes that he has just shipped a fine young Poland-China boar to Oliver Smith of Blythe.

Kounias Registered Stock Farms, Modesto, is a growing breeding establishment that is going to be heard from regularly from now on. The herd of registered Holsteins has been selected with a great deal of good judgment of type, and the females are largely of one family, thus affording the best sort of foundation for intensifying blood lines. James Sullivan, who made a record for himself while in charge of the Stenzel herd at San Lorenzo, has been secured as herdsman and will have a string of promising heifers to go on test under his care this winter. Of recent records made in this herd, Dominita Colantha De Kol made 25.47 pounds butter in seven days, and Dominita Bonnie De Kol 4th is now making a record around 20 pounds. The three year old Lady Dominita De Kol, now in test, promises to make around 22 pounds. The senior sire at the head of this herd is King Korndyke Hengerveld Ormsby 7th, a splendid grandson of the great Pietertje Maid Ormsby. The junior sire is Toyon King Korndyke Soldene, son of a 33 pound daughter of King Hengerveld Aaggie Payne, and he is developing into a wonderful good individual.

J. W. Benoit, Modesto, has made a well earned success with registered Holsteins, and now has his farm and herd in shape for further progress. Mr. Benoit had a silo this year for the first time and is enthusiastic over the economy of feeding silage, especially during these days of high prices. The cows and heifers also show the effects of succulent feed and are in good condition. This herd shows a remarkably good butter fat test, the milk statements for months showing a uniform test from 4.1 per cent to 4.3 per cent. The senior herd sire is El Prado Wayne Colantha, a 30 pound grandson of the great Colantha Johanna Lad. The junior sire is a grandson of Rag Apple Korndyke, out of the 32 pound cow Jennie Terzool Hicks 4th, who also made upwards of 1000 pounds butter in 305 days and sold at auction for \$2250.

Tagus Ranch, Tulare, now has a herd of registered Holsteins of which any breeder might well feel proud. The dairy department of this great ranch organization is under the direction of Frank E. Gillam. When Mr. Gillam took charge of the herd it must be admitted that the herd was anything but in good flesh and fitness, although it was composed of animals of good type and breeding. Today the herd shows the effect of correct feeding and care and many of the cows are approaching the official test period in first class shape. The heifer herd is remarkably good, in fact the writer doubts if there is a better average lot of equal size to be found in a long journey. Not the least conspicuous among them are three beautiful daughters of King Segis Pontiac Janek, James J. Jeffries' splendid herd sire. The Tagus herd is headed by King Sadie Vale Rose, son of King Korndyke Sadie Vale and out of the 27 pound cow Queen Rose Paul, thus making him full brother to King Korndyke Sadie Vale 27th, one of whose young daughters sold in the Guaranty Sale for \$1400. Mr. Gillam has been weighing and testing the milk of every cow in the herd, and has culled the herd right down to the real producers, and it is upon these that the future Tagus herd will be built.

E. E. Freeman, Modesto, recently sold the first son of his herd sire Segis Pontiac De Kol to head the grade herd of M. Leonardo, who thus introduces great yearly record blood into his herd.

Dairymen often ask us what variety of beets to plant for cow feed, and inquiry among a number of successful beet feeders indicates that Mam-

moth Half Sugar is a popular beet with them.

Madrigal Mookie 2nd, owned by Tulare Holstein Farm, Tulare, recently made an official record of 20.01 pounds butter in seven days as a senior two year old.

Sunnyside Herd of registered Hol-

### When you Figure it all up —

you may find some of your cows are a liability instead of an asset. Why? Almost every cow can be a profitable producer if her system is working properly and she is free from disease.

Kow-Kure, the great cow medicine, is just what the average overworked milch cow needs. It works on the digestive and genital organs and puts the system in condition to prevent disease and produce properly. Also a sure remedy for Abortion, Barrenness, Retained Afterbirth, Scouring, Lost Appetite, Bunches and other common diseases.

Try Kow-Kure on your poor milkers—you'll find it makes good every claim; in many dairies it has turned losses into profits. Feed dealers and druggists sell Kow-Kure; 55c and \$1.10 packages. Write for free treatise, "The Home Cow Doctor."

Dairy Association Co.  
Lyndenville, Vt.

### World's Greatest Dairy Cow, Tilly Alcartra Why?

Because she has proven by every test that she is the most consistent producer ever known.

She has produced more milk and butter fat in her first five lactation periods than any other cow in the world, an average of 24,670 pounds milk and 963.80 pounds butter per year.

She is the only cow of the breed that has produced over 1000 pounds butter for three consecutive years, average 1140 pounds.

She was the first cow in the world to produce 30,000 pounds of milk in a year.

She is the only cow in the world that has produced over 60,000 pounds of milk in two years (60,278 pounds).

She has been awarded more prize money by the Holstein-Friesian Association of America on her production records than any other cow that ever lived.

She is California's first 40 pound cow.

**SHE IS A REGULAR BREEDER.** You can share the benefits of her great production by the use of one of her grandsons, by her son, King Morco Alcartra, whose sire is out of the former world record cow, Riverside Sadie De Kol Burke. They are priced mighty low, quality considered. Write today.

At the bottom of your letter to advertisers just say "California Cultivator" and prompt reply is assured.

steins, owned by R. F. Guerin, Visalia, will be sold down to heifer calves at public auction on Mr. Guerin's farm, Thursday, April 4. The sale will offer 51 head of cows of milking age, and all young except two, 21 head of yearling and two year old heifers, nearly all bred, and about ten good young bulls. For his future herd Mr. Guerin will keep nothing except the young daughters of his richly bred herd sire, Sir Veeman Korndyke Pontiac, the only son of Sir Veeman Hengerveld on the Coast, and he is out of a 30 pound daughter of a 29 pound cow. This sire now has about 30 young daughters in Mr. Guerin's herd, about 55 of the females in the sale are bred to him, and he is to be sold in the sale. The sale will be under management of California Breeders' Sales and Pedigree Company, Sacramento.

Aralia De Kol Pontiac Mead, the new state record senior three year old, has again increased her record and now has 34.16 pounds butter to her credit in seven days and is still on test. She is sired by Segis Pontiac De Kol Burke and is owned by A. W. Morris & Sons Corporation, Woodland.

Newcomers at farm of H. L. and E. H. Murphy are a litter of nine farrowed January 6, by Brighton Faoni Duchess 3rd 244111, sired by Kennett Lee 3rd 155390 of the old line of Murphy prize winners. The granddam of these pigs; Jenette Lee 109443, was shown by Geo. A. Murphy on the Oregon, Washington and California circuit of fairs, and was never defeated. During her life of four years she was made champion at the Alaska-Yukon-Pacific Exposition, and at the Oregon and California state fairs. There is good blood in these youngsters.

The owners of Toyon Farm Association, Los Altos, have an increasing gratification at the calves of FINDERNE Soldene Valdessa their herd sire. Aside from being excellent individuals in the ordinary sense, they are particularly conspicuous for their great depth of body. The latest arrival in the herd is a daughter of this sire out of a granddaughter of Lord Netherland De Kol which weighed over 115 pounds at birth.

Bert M. Carner is one California high school instructor who takes a lively interest in agriculture. He is principal of Gonzales Union High School at Gonzales, California, and the agricultural club of his school numbers upwards of 20 members. At his suggestion the entire club looked over the registered Holstein bulls sold at auction at Gonzales on January 19, and one member of the club, Alfred Clark of Soledad, bought a young bull in the sale the following day.

California Cattlemen's Association announces that a great many inquiries have been received from parties desiring to purchase cattle and from cattlemen desiring to secure pasturage and hay. Pasturage is available for many thousand head in Sonoma and Mendocino Counties. Any information concerning available pasturage throughout the state will be very gratefully received by the Secretary of the California Cattlemen's Association, 320 Sharon Building, San Francisco.

Hollow-Hill Farm on Tuesday of last week sold the last two Guernsey bull calves of service age sired by King of Hollow-Hill 25876; one out of Imp. Brittleware Wild Rose 48508, whose record is 508 pounds of butter fat at 4½ years, went to Middledale Farms, Goshen, Oregon, and the other out of the new class-leader cow, Imp. Brittleware Mistletoe 48510, whose record is 14,467.2 pounds of milk and 751.4 pounds of butter fat at 4½ years, goes to head the herd of C. S. Rassmussen, a prominent Guernsey breeder of Loleta. The amount paid for the latter calf was \$850, which is one of the highest prices ever paid for a yearling Guernsey bull in California.

Guy H. Miller reports: "I have sold two young bulls from Venadera Herd of Jerseys. Have sold to Mr. R. T. Kee of Bodega Wanda's Exile Duke No. 149823. His sire, Belleview's General, combines the blood of the well known Owl and Oxford Lad families. The young bull's dam is Wanda of Venadera, one of our well known show cows. She has been senior champion at the state fair, has won

## We Offer:

A Son of a 27.91 Pound 3 Year Old That Milked 98.6 Pounds in One Day

He is sired by FINDERNE SOLDENE VALDESSA who is being bred to our entire herd of carefully selected females, including five cows with records from 30 to over 33 pounds butter in seven days. FINDERNE SOLDENE VALDESSA is by King Valdessa, son of the great producing and transmitting cow Valdessa Scott 2nd, 41.88 pounds butter in seven days, 164.29 pounds in 30 days, both world's records when made, and she is the dam of five A. R. O. daughters with records up to over 33 pounds butter in seven days.

Finderne Soldene Valdessa

The dam of FINDERNE SOLDENE VALDESSA is the world's record heifer Finderne Soldene Hengerveld, 35.34 pounds butter in seven days at first calving, and she is by the wonderful sire King Hengerveld Aaggle Fayne who has three junior three year old daughters with records from 31.94 to 37.33 pounds butter in seven days, and four senior three year old daughters with records from 35.33 to 37.13 pounds butter in seven days. One of his daughters holds the world's record in the junior two year old class for yearly production with a record of 1200.64 pounds butter, another holds the world's record in the junior three year old class with a production of 1395.06 pounds butter in one year, and a third daughter made 1075.29 pounds butter in one year as a junior three year old.

THE YOUNG BULL WE OFFER WAS BORN NOVEMBER 26, 1917. HE IS A NICE STRAIGHT CALF, AND HIS DAM AND SIRE'S DAM AVERAGE 31.62 POUNDS BUTTER IN SEVEN DAYS, BOTH RECORDS MADE AS THREE YEAR OLDS. HE WILL SELL QUICKLY AT THE PRICE WE HAVE PLACED ON HIM.

## Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Transplanting

Please give information as to transplanting live oak, white oak, Christmas berry and bay tree. How large may they be when practical work may be accomplished?—Subscriber, Paso Robles.

The best advice is founded on experience, and while I have moved oaks at least 20 years old, here is what is being done at present by the Los Angeles park commission (of which I am a member). We have bought from a dealer at \$5.00 each a number of live oaks from 10 to 15 feet high and from one to three inches in diameter of trunk one foot above the ground. They are balled and sacked and warranted by dealer to grow, any dying within 60 days to be replaced by him without cost to us. The balls are

from 12 to 18 inches in diameter and of like height; none are larger. A few trees four inches in diameter (for special use) were boxed in 24 inch boxes. They have been grown in nursery rows and never moved since planting. I would advise amateurs to dig bigger balls of soil if convenient. The present time or next month is good for such work. The white oak (*Q. lobata*), being deciduous, may be moved without soil and with longer roots, but do not let roots get dry.

Bay trees may be handled in like manner and season with equal success. The Christmas berry is not so easily or safely moved, though same time and methods may be observed. But I would move plenty of soil and prune back top to a good round head, reducing natural top by one-half.—E. B.

### Not Laying Well

I have 200 White Leghorn hens, one year old, with a very good first

year's record. Their moulting time was long, (too long I think this year) and though they look fine now, they are not laying as they should. Can you write me what to do or feed to start them off?—Subscriber San Dimas.

A little additional protein in the ration is often needed to start hens to laying again after the molt. This additional protein may be in the form of buttermilk or skim milk, of green cut bone or of one of the vegetable proteins such as soy bean meal or linseed meal added to the dry mash. A moist mash in which cut-up greens have been mixed with the ground grains of the regular mash, and the whole moistened with milk, is one of the best things for hurrying up slow pullets or laggard molters.—J. A. K.

### Grapefruit and Milk

In the California Cultivator of January 26, 1918, page 106 we find a query with regard to eating grapefruit and drinking milk at the same meal. The question was referred to Prof. M. E. Jaffa who writes as follows; "I regret we have no direct evidence of injurious effects, if any, of the use of grapefruit juice in the diet of a child of five to six years old." We take exception to Prof. Jaffa's reply. Why should he regret having no direct evidence of in-

jurious effects of grapefruit taken by a child? On the other hand we are very glad grapefruit is such fine fruit for children to take at the same time they take mush and milk for breakfast. We grow lots of grapefruit and have some dairies in Imperial Valley and we do not like to have the children encouraged to discontinue the use of both. Have been a subscriber of the California Cultivator for a good many years and have not a grouch on, but we hope the professor's regrets will hereafter be a little more reasonable.—Frank L. Weed, Calexico.

We might refer this to Prof. Jaffa for his own information, but we think we can safely say that our subscriber has entirely misunderstood the professor's remark. The exact quotation of the one sentence is, "I regret we have no direct evidence of injurious effects, if any, of the use of grapefruit juice in the diet of a child of five or six years old." But later in the paragraph he does commend the use of grapefruit for young children. Now the real intention of Professor Jaffa's remark was simply to show that he regretted that he had no definite data at hand. Our expert and professional friends have a weakness for definite and absolute facts and often refer to precedents to prove their point. Professor Jaffa's friendship for food producers of California is too well established to need defense on a charge that he regrets he has no information that will prove injurious to any feature of productive industry, and the greatest favor to any industry is to give the truth regarding it, and if it is unwise to feed very young children on milk and grapefruit at the same moment, it is better to have given the warning, as Professor Jaffa did, than to injure the industry by ill effects from lack of proper feeding. Let us all eat more of grapefruit and in a way which increases its consumption. It is one of the most healthful fruits.

### Inoculation of Alfalfa

Is inoculation of alfalfa as beneficial as some people selling the cultures claim? What condition of soil, if any, makes its use necessary? Could you state the cost per acre, also exactly how it is applied to seed, and any other information you might have?—Subscriber, Winton.

If one is planting a new field of alfalfa where legumes have not been grown, there is no question but that nitrogen gathering bacterial cultures will prove beneficial. These cultures are sometimes secured from the soil of fields where alfalfa has long been established and grown luxuriantly. More often, and we presume it is more satisfactory in general, is the securing of cultures artificially prepared and which are offered by chemists. Full instruction are given with each treatment. The cost is not far from \$1.00 an acre for the material. Then there is slight cost of time in handling it so as to inoculate the seed.

### Poor Breeders

In regard to "Goats Not Breeding" in "Questions and Answers," issue January 26, the following might perhaps be of use to Subscriber, Anaheim:

Some goats do not seem to show when they are in heat. I owned one last year and never saw it in heat, but had it tied near a buck in a pasture and it bred and had three kids. This year a party brought two goats to breed and left them with me. One of them did not breed last year. I observed her very closely. She hardly gave any sign and there was practically no swelling. She got with kid all right. Another is irregular and her offspring were poor breeders. But the owner persevered and finally got them with kid. This difficulty seems

## TODAY versus YESTERDAY

Little more than a decade ago, giant steam tractors represented the highest achievement in mechanical farm power—and Holt steamers then held a place in the lead. Today, the old steamers have been almost entirely displaced by gas tractors, but Holt still holds the lead. Thirty-five years' manufacturing experience, combined with correct design and choice of materials, have made the "Caterpillar" Tractor first in strength, power and endurance. This superiority results in longer tractor service, lower operating and upkeep costs, larger profits.

The "Caterpillar" Tractor's achievements on European battlefields and the satisfaction it has given thousands of farmers, freighters and contractors are your safest guide to the right choice.

to affect her kids and their kids. The feed does not seem to have any influence in breeding goats. I don't let my bucks run with the does, but in the Anaheim subscriber's case it might be advisable.—J. G. French.

## Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.  
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

### Recording Contract

A man buys a tract of land on a contract of sale. Is it necessary for the contract to be recorded to be of value, California law?—Subscriber.

The contract between the buyer and seller is perfectly good without being recorded, but in order to give any third persons notice of the title of the buyer it is necessary that it be recorded. To record your contract is the only safe way to do.

### Penalty for Starting Fire

A has a summer resort. B has land near by. A, or some of his associates, start a fire which burns over B's range, doing damage. The fire warden notifies B that A was responsible. A denies this, saying that he was not at the resort when the fire started. Can B collect damage from A? — Subscriber, Lemon Cove.

Regardless of whether or no A was present when the fire started, if the person who started the fire was the agent or sub-agent of A, he could be held. If there was no relation of principal and agent between A and the actual person starting the fire it is difficult to see how A could be bound by the unauthorized act of someone with whom he had had no dealings. There are two methods, however, to get at this matter: First, in the political code there is a provision reading as follows: Every person negligently setting fire to his own woods or negligently suffering any fire to extend beyond his own land is liable in treble damages to the party injured; second, in the penal code it provides that every person setting fire, or causing fire to be set to any forest, brush, or inflammable vegetation growing on lands not his own without permission of the owner of such land; allowing fires to escape from the control of persons having charge thereof or to escape to the lands of any person other than the builder of the fire; or burning brush, or grass on his own land without taking every proper precaution before lighting the fire to prevent its escape; or leaving any fire burning or unextinguished on departing from a camp is guilty of a misdemeanor punishable by fine of not less than \$50 nor more than \$500 or imprisonment in the county jail for not less than 11 days nor more than six months, or both such fine and imprisonment.

### Property Rights of Wife

What rights has a wife in property accumulated during marriage through the joint efforts of husband and wife?—Subscriber.

The husband has the management and control of the community property, both real and personal. Of the personal property he has absolute power of disposition, other than testamentary, provided that he cannot make a gift of the personal property, nor can he sell, convey, or encumber the furniture or fittings of the home, or wearing apparel of the wife or minor children without the written consent of the wife. As to the real prop-

## SPRAY

### Fine, Mist-Like Spray

under heavy pressure is the only kind that does the work properly. Our famous Tiger strainer nozzle gives a fine mist-like spray, forming a cone of large angle.

### The FIELD-OSPRAYMO

engines and pumps yield a maximum and constant pressure that lightens labor and insures a perfect "cover" of foliage.

Automatic agitators keep the liquid in constant solution. Brushes clean the suction strainers, and prevent sediment from clogging pumps and nozzles.

#### OUR 1918 CATALOG

describes the entire Ospraymo Line in detail. Write for a Free Copy. For 10c we include the handsome book "Why and How of Orchard Success," an authentic spraying guide of 94 pages.

#### FIELD FORCE PUMP CO.

Department 7      Elmira, N. Y.  
Warehouses at Oakland and Los Angeles, Cal.  
Address: Field Force Pump Co., Show Rooms  
at 164 No. Los Angeles St., Los Angeles, Cal.

When writing advertisers, mention The Cultivator.

## Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 31,000 readers, weekly  
Liner rates: Single insertion 3c per word;  
yearly contracts 2½c per word. 35c per issue minimum charge.

### TREES

**For Sale**—Extra fine Valencia trees, ½ to 1½, all sour root, high buds, very thrifty, clean and straight, not fertilized, excellent soil for balling, nothing better grown. Can supply a limited acreage yet closing out entire lot of these fine trees. S. R. Coate, 564 S. Los Angeles St., Anaheim, Cal. Phone, Anaheim Pacific 403-J.

**Famous Tom Barron White Leghorn** eggs \$2.00. E. F. Barclay, Lindsay, Cal.

## HOGS

**The Billiken Brand of Chester Whites**—There is right now a big shortage of swine in California. The output of 1918 will show even a greater shortage unless the farmers of this state get busy and raise more hogs. Good breeding stock is scarce and hard to get. **THE BILLIKEN BRAND** represents the best obtainable; they are of that mellow type that mature early and are such satisfactory easy feeders. Get started with this strain and help out the Food Administration and your own pocket as well. Write me your wants—do it today. I can still furnish first class animals at reasonable prices. C. B. Cunningham, Mills, Cal.

**Grape Wild Farm Berkshires and Guernsey Bull Calves**—Only a few more boars left from 6 months to a year old, sired Grand Leader 2d, the Grand Champion of the world. Also a few of the tops from our fall litters by Royal Superbus and Fashion Longfellow 27th, and a few bred gilts. Our herd won the Premier Breeders' Ribbon at the P. P. I. E. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

**Bernsteins Herd**—"One of the Best in the West" has three great herd boars. King's Big Bone Leader, Young Jumbo, and King's Massive Orange. Watch for the sensational offering of sows bred to this great trio which sell in the Big sale of the Kings' County Poland-China Breeders at Hanford, February 20. Bernsteins Ranch, Hanford, Cal., W. Bernsteins, Proprietor.

**For Sale**—Several four and five months old Poland-China boars, registered. Something that you will be proud to place at the head of your herd. Write for price and information. Address H. B. Peake, Manager, 358 11th St., San Bernardino, Cal.

**Superba, World's Grand Champion Poland-China boar** and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

**Duroc-Jerseys**—Sold out of bred gilts. Two service boars. One of them an outstanding individual for sale. Also Fall Pigs, both sexes. Twenty-three ribbons on 11 entries, including 6 champion-hips, State Fair, 1917. Frederick M. Johnson, Napa, Cal.

**Berkshires**—First prize junior boar; first and second senior boar pigs including junior champion; fifteen spring and fall open gilts sired by Ames Rival 115, champion boar; and two junior yearling bred sows priced cheap for immediate sale. F. D. Hall, Perris, Cal.

**We Pay Cash for Hogs of All Sizes**, weights and breeds. Any number from one to several thousand considered. What have you? Durbin and Forbes, 722 San Fernando Building, Broadway 4170, Los Angeles.

**Duroc-Jerseys**—The blood of champions such as Defender, Orion Chief, Taxpayer "13," Golden Model. A few choice fall gilts of Grand Champion Breeding at reasonable prices. T. R. Bond, Tip-ton, Cal.

**For Sale**—18 Poland-China brood sows, 3/4 pure bred, 3 with litters, 1 registered pure bred Berkshire boar, 66 pigs 3 months old. All vaccinated except suckling pigs. H. R. Greene, Riverside, Cal.

**Duroc-Jersey Registered**—15 about 3 months old; 9 sows; 4 barrows; 1 boar. Price \$20 each for the lot. \$25 for less. Beauties. Garden City Sanitarium, San Jose, Cal.

**Large Yorkshires**—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

**Recorded Poland-China boar**, 18 months old, sired by Superba. Bargain at \$50.00. Immured, and tried breeder. C. R. Hanna, Riverside.

**PLW Durocs**—Golden Models and Great Wonders are the most consistent winners at every show. Peters, Lamson & Walker, Devore, San Bernardino County, Cal.

**Large Type Poland-Chinas** are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, Cal.

**Rancho Rubio Durocs** all sold out except some choice fall boar pigs. Write for prices. Elmer Lamb, Ceres, Cal.

**Should Like to Dispose of 1000 hogs**, or hog feeders, weigh 75 to 150 lbs. Address E. F. Sanguinetti, Yuma, Arizona.

## TURKEYS

**Just One Grand Champion Sweepstakes** Special offered for the best pair of turkeys in the show at the California State Fair, 1917, and that prize was won by GOLD NUGGET STRAIN GIANT BRONZE TURKEYS. They again proved their superiority by winning at three great shows, California State Fair, 1917, Texas State Fair, 1917, Los Angeles, 1918. Gold Special Sweepstakes at all three shows. Each judge pronounced them the best in the show, all breeds competing. Remember it was the Gold Nugget Strain that won at America's greatest turkey show, World's Fair, San Francisco. Three prizes on four entries.

Large turkeys can be raised at practically the same cost as small ones. My toms will give you an increased weight of five pounds the first year. Either stock or eggs will give you vitality, size and beauty. Address all communications to J. Will Blackman, 607 East Third St., Los Angeles, Cal.

**Turkey Eggs**—I will have about 1000 Turkey eggs for sale March 10 to 25 from good Utility Bronze Turkeys. Toms weight 22 to 25 pounds, hens 10 to 15. 90 per cent fertility guaranteed. Price \$25.00 per 100 f. o. b. C. P. Emerson, Gardena, Cal.
